Northwest Indian Fisheries Commission

Good afternoon,

Attached, please find a letter and attachment from NWIFC Executive Director Justin Parker to Eleanor Ott, Water Quality Permitting Specialist, Washington State Department of Ecology regarding NWIFC Comments on Draft Nutrient General Permit in Puget Sound.

If you have any questions, please contact Mike Martinez, NWIFC Habitat Policy Analyst at mmartinez@nwifc.org.

Thank you.

Northwest Indian Fisheries Commission

Eleanor Ott, Water Quality Permitting Specialist Washington State Department of Ecology P.O. Box 47696 Olympia, WA 98504-7696

Re: NWIFC Comments on Draft Nutrient General Permit in Puget Sound

Dear Ms. Ott:

On behalf of the Northwest Indian Fisheries Commission (NWIFC), attached please find the list of nutrient principles submitted to help inform the Washington Department of Ecology with its deliberations regarding the Puget Sound Nutrient General Permit. The 20 member tribes of the NWIFC¹ are beneficiaries of a trust relationship with the United States, the trustee, with constitutionally protected, treaty-reserved rights to harvest, consume, and manage fish and shellfish in their usual and accustomed areas. *U.S. v. WA.*, 384 F.Supp. 312 (W.D. Wash. 1974); *aff'd sub. nom., WA v. Washington State Commercial Passenger Fishing Vessel Ass'n.*, 443 U.S. 658 (1979); *U.S. v. WA*, 873 F.Supp. 1422 (W.D. Wash. 1994) (Shellfish I) and 898 F.Supp. 1453 (W.D. Wash. 1995) (Shellfish II); *U.S. v. WA*, 157 F.3d 630 (1998) (Shellfish III); *cert. den. U.S. v. WA*, 119 S.Ct. 1376 (1999). This request is submitted in view of the need to ensure protection and restoration of these and other reserved rights, resources and habitats, and to safeguard the health, livelihoods and well-being of tribal members.

The attached principles are intended to support the state in developing a general permit to better address nutrient reduction in the Salish Sea. The State of Washington and its subdivisions need to expedite nutrient reductions in order to limit further harm to treaty reserved tribal resources and the Puget Sound ecosystem. Thus, nutrient discharge reductions are needed rapidly throughout the basin, with significant load reductions from the largest dischargers addressed in first permit cycle.

¹ The NWIFC member tribes are the Lummi, Nooksack, Swinomish, Upper Skagit, Sauk-Suiattle, Stillaguamish, Tulalip, Muckleshoot, Puyallup, Nisqually, Squaxin Island, Skokomish, Suquamish, Port Gamble S'Klallam, Jamestown S'Klallam, Lower Elwha Klallam, Makah, Quileute, Quinault, and Hoh.

We urge Ecology to engage with interested sovereign tribal nations while developing the Puget Sound Nutrient General Permit. If you have any questions, please feel free to contact Mike Martinez, Habitat Policy Analyst, at mmartinez@nwifc.org.

Sincerely,

Justin R. Parker Executive Director

Jelptin N. Pahar

<u>Problem Statement – Impacts of Excess Nutrient Loads on Treaty Resources and Puget Sound Food Web</u>

Marine and coastal ecosystems face challenges from the effects of changing ocean chemistry due to ocean acidification, and hypoxia or low dissolved oxygen, with human sources of nutrients contributing to acidification and lower dissolved oxygen levels. Approximately 20% of the area in the greater Puget Sound does not meet the dissolved oxygen standards.¹ Low dissolved oxygen will continue to cause habitat fragmentation and reduction for some species, with low marine dissolved oxygen contributing to: acidification, which can prevent shellfish and other marine organisms from forming shells; shifts in the number and types of bottom-dwelling invertebrates; increases in abundance of macroalgae, which can impair the health of eelgrass beds; seasonal reductions in fish habitat and intensification of fish kill events; and potential disruption of the entire food web.

- In numerous Salish Sea locations, seasonal oxygen levels are below those needed for fish
 and other marine life to thrive, thereby affecting tribal water-based resources and treaty
 harvest opportunities.
- Models indicate that nutrient loads discharged into the main basin of Puget Sound are transported to the South Sound and Whidbey Basin, demonstrating that discharges in one basin can affect the water quality in others. Therefore, wastewater treatment plant (WWTP) permit requirements must acknowledge and address ecosystem-wide impacts to protect water quality in the Salish Sea.
- Current WWTP discharges to Puget Sound, together with nonpoint nutrient sources in rivers, violate the state water quality standards for dissolved oxygen in Puget Sound set under the federal Clean Water Act. Ecology is thus obligated to implement measures to reduce nutrient discharges.

Expedited WWTP Nutrient Discharge Reductions Are Necessary

Meaningful and immediate action is necessary to address this known problem. Current models show that if reductions are made at all municipal WWTPs a 50% improvement in areal compliance can be expected with regard to dissolved oxygen standards. "[F]uture population growth in the Salish Sea region will likely increase human nutrient loads, including excess nitrogen and carbon from wastewater, stormwater, agricultural runoff, and other land-use activities. Regional population growth will contribute to further [dissolved oxygen] concentration reductions if no actions are taken to reduce human nutrient sources." Permittees should plan for future nutrient reductions without delay, while also planning for WWTP hookups needed to accommodate future growth without increasing nutrient discharges. Puget Sound nutrient general permit monitoring and reporting methods must be sufficient to document discharges and reductions, inform adaptive management and determine compliance with water quality based effluent limits. Ecology should implement significant nutrient reductions in the first Puget Sound nutrient general permit cycle,

using known technologies to remove both nutrients and chemicals of emerging concern – a priority recommendation of Governor Inslee's Southern Resident Killer Whale Task Force.

- Treaty resources and harvests have already been affected by excess nutrient loading.
 Therefore, the Puget Sound nutrient general permit should be implemented rapidly with significant load reductions from the largest dischargers addressed in first permit cycle.
- Commercial, recreational and tribal fisheries experience harm from Salish Sea dissolved
 oxygen impairments, as do other designated uses. Tribes and these other interests should
 not bear the cost of excess WWTP nutrient discharges. Each sovereign tribe that suffers
 impairments to their reserved resources from nutrient-related discharges must experience
 aquatic habitat recovery as soon as practicable.
- The costs of nutrient reduction should appropriately be allocated to permittees whose discharges contribute to violations of water quality standards. Ecology should implement significant nutrient effluent limits at each WWTP starting with the first general permit cycle, as well as through any interim or other individual permits.
- All Puget Sound nutrient discharge permits should require water quality based effluent limits for each WWTP and exceedance of limits warrant application of all known, available, and reasonable treatment technologies to protect and restore water quality and fishery uses.
- If permit effluent limits in the context of the Puget Sound Nutrient Reduction Plan are insufficient to promptly demonstrate compliance with water quality standards, then Ecology should consider other alternatives including an overarching Clean Water Act Total Maximum Daily Load for Puget Sound nutrients and dissolved oxygen.

Watershed Nutrient Reductions Are Necessary

Agricultural runoff carried by rivers, discharge from failing septic systems, and wastewater treatment plant loads collectively carry nutrients and organic carbon into marine waters.

- The state should advance consistent science-based riparian buffer protection in agricultural and urbanizing areas to help address watershed nutrient loading.
- Consideration should be given to both WWTPs and watershed nutrient loads affecting tribal resources.
- Ecology should consult formally with all affected co-manager tribes, and consider dissolved oxygen and nutrient concerns necessary to tribal shellfish and salmon recovery objectives.
- It would be inappropriate for Ecology to allow continued degradation of treaty resources for some tribes while promoting recovery in other regions first. Ecology must engage each sovereign tribe and their reserved treaty resources on an individualized basis.
- Implementation of water quality trading should not result in unaddressed impairments to tribal treaty resources.
