

Felicity Erdmann

I am supporting Soap Lake's designation
as an Outstanding Resource Water Tier IIIB.

This lake is unique because the layers of water do not mix.
Species seen nowhere else have adapted in this lake
and should be studied. Bacterias only found in this lake are being
identified by by varying scientists. Algae which can be used as
biofuels and other products which remove carbon dioxide from the air
are subjects that the researchers at the University of Montana want to
study according to an article posted in 2022.

MSU researchers seek to optimize algae biomaterials production
