

Felicity Erdmann

This mineral lake is a very unique lake for scientific research due to the unheard of species of algae and bacterias that exist in this meromictic environment.

Personally I have been performing Research on many Psoriasis subjects and have found that exposure to the mineral water and exceptional mud base of this lake absolutely improves their skin. Bastyr Naturopathic University will be the recipient of my research.

My hope is that the lake be preserved as best as possible by creating mitigation plans to deter pollution. Saving this treasure for future generations is something not to be taken lightly. Many species of birds also depend on this lake's natural habitat to exist. Keeping this lake from degrading is essential.

My hope as a citizen of Soap Lake is that our amazing lake be preserved in an environmentally conscious manner for generations to come.
