

Randy Harrison

I am not a scientist and know right from the start this is a terrible thing. From a very basic concept it is wrong. Humans want to change the chemistry of the ocean water. And you think it will not have an adverse affect. Have we learned nothing about human involvement in mother nature. Cause and effect. Every item that has caused environmental issues in the past have all had the initial blessing of scientists, to learn later of the consequences. You CANNOT change the nature of things without consequence, you all know it. Mark my words, we will pay for this project in the future.
