District budget for all functions of approximately $5 million per year. These costs would have no measurable benefit on San Francisco Bay proper because the District's discharge constitutes such a small portion (less than 1%) of the municipal discharge to the Bay and according to the EPA economic analysis, point source discharges contribute only 1% to 11% of the total toxic loading to the Bay. Thus, the District contributes between 0.01% and 0.1% of the toxic pollutant load to the Bay. The sole benefit of the costly end-of-pipe facilities necessary to achieve compliance with the CTR criteria would be to achieve the criteria in Schell Slough, before it enters Second Napa Slough. The District is willing to pursue source control and other reasonable measures to reduce the discharge of these constituents, but the costs necessary to achieve the proposed CTR criteria in-stream do not appear commensurate with the benefits. Although the District has not calculated the cost per toxic pound equivalent that would be removed by such facilities, the cost would likely exceed by an order of magnitude the $200 - $500 cost triggers for regulatory relief, which EPA used in its economic analysis.

(*1) The District's current permit contains a number of effluent limits based on the old State Plans. However, those effluent limits are not legally enforceable in that they were based on water quality . plans that were determined by the court to be illegal. For that reason, it would be inappropriate for EPA to assume that adoption of criteria similar to those in the old State Plans would have no effect on the District.

Response to: CTR-038-003

The Sonoma Valley County Sanitation District (District) stated that the CTR could cost the District approximately $7 million per year without providing commensurate environmental benefits. This estimate is based on the assumption that projected CTR-based permit limits would be derived using historic Regional Board permitting practices, which do not provide dilution and do not use metal translators to derive permit limits. The District estimated that tertiary lime precipitation and reverse osmosis would be required for mercury and copper, and that carbon adsorption would be required for organic constituents such as alpha-BHC, gamma-BHC (lindane), bromodichloromethane, indeno (1,2,3-cd)pyrene, chlordane, 4,4'-DDT, and endrin.

The documentation the District provided, however, is not sufficient for EPA to determine whether the District's estimate is consistent with EPA's estimates for sample facilities of the same industrial category and flow range. In particular, the District would need to provide facility engineering data, existing permit limits, and effluent data for the pollutants of concern. The documentation submitted by the District provides only maximum effluent concentrations. EPA is aware, for example, that other dischargers to San Francisco Bay tributaries (e.g., Novato District) have been assigned copper and mercury NPDES limits that are more stringent than projected CTR-based effluent limits (see response to CTR-005-001). When existing effluent limits are as stringent or more stringent than projected CTR-based limits, no costs are attributed to the CTR because the State has the authority under the Clean Water Act to implement water quality standards in a more stringent manner than is required under federal regulations and guidance.

EPA also noted that the District's analysis was based on effluent data that were reported between November 1996 and April 1997 (6 months) and comprise only six observations per pollutant. These effluent data are limited and may not reflect typical discharge conditions. A drought during a particular year, for example, may induce people to use more pesticides; thus impacting effluent quality. Such may be the case in the use of alpha-BHC and gamma-BHC (lindane) which were detected in the effluent at concentrations greater than the projected CTR-based limits. Estimates based on effluent data collected over three consecutive years would be more appropriate in establishing the most effective compliance

strategy. Despite the limited information submitted with the District's comment, EPA believes that the District's estimate is based on implementation assumptions that are different from EPA's assumptions which follow the Technical Support Document for Water Quality-based Toxics Control (EPA, 1991). If the District is analyzed using EPA's methodology and implementation procedures, the facility's potential compliance costs will most likely be insignificant.

With respect to the District's comment that it is not feasible to implement pollution prevention measures for further source reduction of copper, EPA acknowledges that source reduction alternatives may, indeed, not be feasible for all dischargers and pollutants. In the case of copper, for example, the information submitted by the District suggests that its most cost-effective compliance strategy would be to develop a site-specific metal translator and a water-effect ratio. According to the CTR, these two implementationoptions are acceptable and would not result in significant costs. However, significant costs that result from nonstandard implementation practices should not be attributed to the CTR as is done in the District's analysis.

EPA disagrees with the District's assumption that tertiary lime precipitation and reverse osmosis would be necessary for mercury compliance. The District indicated that the facility receives discharges from a State hospital. EPA has information on mercury levels form hospitals, clinical laboratories, and medical waste incinerators which indicates that hospital facilities discharge mercury at levels up to 15 ppb (EPA compiled two documents which are available in the record for this rule: Overview of Pollution Prevention Approaches at POTWs and Pollution Prevention at POTWs, Resources List). There are some potential other sources which could also be addressed with pollution prevention programs to assure a facility would be in compliance with projected CTR-based limits. Based on EPA's costing methodology, pollution prevention is assumed sufficient for compliance when a pollutant is reported below method detection levels and the projected effluent limit is below method detection levels.

The District also indicated that four organic constituents, indeno(1,2,3-cd)pyrene, chlordane, 4,4'-DDT, and endrin were detected in one or two samples at concentrations greater than projected CTR-based limits. Based on EPA's costing methodology, one or two exceeding values out of six total observations would not be conclusive enough to assume treatment costs. Because the available data is not sufficient to justify addition of treatment, and because the District does not indicate having pursued any source reduction efforts for organic constituents (i.e., no information is provided in the comment), EPA estimates that pollution prevention would be a reasonable pollution control strategy for organic constituents. Examples of the successes of POTWs awareness and education campaigns regarding the use and discharge of products containing toxic substances are presented in EPA's Overview of Pollution Prevention Approaches at POTWs and Pollution Prevention at POTWs Resource List, which are available in the record for this rulemaking.

EPA also noted that the District's $7 million annual cost estimate was based on capital costs that are considerably higher than those estimated by EPA. EPA's costs are based on those found in the Treatability Manual Volume IV, Cost Estimating (U.S. EPA, 1980) and adjusted to current dollars using an Engineering News Record index of 1.9. The District indicated that the total capital costs for a reverse osmosis and chemical precipitation system would be $18.9 million compared to EPA's estimate of $5.7 million. EPA believes that its capital cost estimates are reasonable.

Finally, EPA disagrees with the District's statement that compliance costs for point source dischargers will not have measurable benefits on San Francisco Bay because of the relatively small toxic load contribution compared with nonpoint sources. EPA believes that controls on point source dischargers will contribute to attaining standards in the water body. As controls on nonpoint sources are also implemented, the water quality standards can be achieved. However, should the State determine through

a total maximum daily load (TMDL) allocation that controls on nonpoint sources are a more cost-effective approach to achieving standards, the State can redistribute the allocations through the TMDL process. Also note that it is the toxicity of the discharge that is important. That is, even a small discharge can result in increased risks, sediment contamination, and toxics loading.

Comment: 4. Critique of SRCSD Case Study

General

The findings of the Sacramento case study are summarized in Appendix I-C.

The summary analysis flags three pollutants: mercury, aldrin and alpha-BHC as having a reasonable potential to exceed projected CTR-based WQBELs. Projections are then performed to determine a compliance cost related to achieving reductions necessary to comply with the CTR - based limits. This is accomplished by establishing a pound-equivalent reduction needed for each pollutant and relating this to estimated costs (taken from the " . . Great Lakes Water Quality Guidance (April, 1993)). From this a cost-effectiveness ratio is established. For Sacramento, the data used results in a fairly low (favorable) cost-effectiveness ($1.30/annual toxic load equivalent).

A review of the Sacramento case revealed significant problems with the data and assumptions used to derive the cost-effectiveness ratio. These have resulted in a gross underestimate of the ratio and bring to question the validity of the entire analysis. The main problems were use of questionable data without qualification and unsubstantiated assumptions in the cost to achieve compliance. The following details the concerns specific to each pollutant identified.

Mercury

In the analysis a pound-equivalent for mercury was determined using the following:

Regional Plant design flow of 181 mgd. Maximum single effluent mercury concentration of 0.360 ppb. Toxic Weight factor of 500

The total mercury discharge loading is then calculated by applying the design flow of the Regional Treatment Plant and the maximum effluent mercury concentration. It is further assumed this maximum value occurs on a daily basis resulting in a calculated 198 pounds mercury per year (or 99,177 pound

equivalents). This method severely overstates the amount of mercury potentially discharged or even existing in the system. A more appropriate method would be to use the mean concentration to calculate toxic-pound equivalence Further, the 0.360 ppb value has previously been identified as an outlier.

Aldrin and Alpha BHC

The use of either of these compounds in the analysis is questionable based on a qualified review of the data.

The compound alpha-BHC has never been detected in all effluent testing performed. Due to the use of different analytical laboratories over the years, the laboratory detection level has varied. However, through 1996 only 1 case out of 41 samples had a detection level above the listed CTR-based limit. It was this one case that was used to perform the pound-equivalent evaluation and cost analysis for reduction for the Sacramento case study. However, based on sampling it is doubtful as to whether this pollutant is present in the plant wastestreams, since the results of testing using low-level detection limits has demonstrated nondetects significantly below the CTR-based limit. A similar case is made for Aldrin which has been detected only once in the effluent in all testing performed.

The case study applied the highest detection levels for each compound to determine the pound-equivalent reduction necessary to achieve compliance. Once again this grossly overestimates the amount of pollutants in the system. Further, it is stated in the case study that these compounds will be controlled through pollution prevention/waste minimization and a cost of $400,000 assigned for both pollutants. The overstated pound-equivalent coupled with the unsubstainated cost for control yields a relatively low cost-effectiveness ratio. However, it should be noted that both these compounds have been banned for at least a decade and therefore do not lend themselves to the techniques of pollution prevention since there is no identified point source.

Response to: CTR-041-009

See response to CTR-004-003.

EPA calculated pollutant loading reductions for each facility by calculating the difference between the baseline effluent concentration and the projected CTR-based effluent limitation. The approach for calculating the load reductions, therefore, varied depending on the costing scenarios.

For the low scenario, the following assumptions were used: No reduction was assumed if the difference between the baseline value and the CTR limitation was negative. If the existing effluent concentration was above the MDL but the CTR-based limit was below the MDL, the CTR-based limit, or one-half of the MDL (whichever produces a smaller load reduction) was used for the CTR-based effluent limitation. If the maximum reported effluent concentration exceeded the existing permit limit, high scenario assumptions were employed.

For the high scenario, the following assumptions were used: If all effluent data for a pollutant were reported below detection levels, the method detection level (MDL) was used as the maximum observed concentration. If the maximum observed concentration was below the CTR-based limitation, no loading reductions were considered. If the difference between the baseline value (existing permit limit or effluent concentration) and the CTR limitation was negative, zero reduction was assumed. If both the CTR-based WQBEL and the existing permit limit were below the analytical MDL, one-half of the difference between the existing permit limit and the CTR-based limit was used to estimate the pollutant load reduction. If the existing permit limit (or effluent concentration in the absence of a permit limit)

was above the MDL, but the CTR limit was below the MDL, the CTR-based limit, or one-half of the MDL (whichever produced a smaller load reduction) was used for calculating pollutant load reductions.

To determine the reduction in loadings, EPA converted the difference between the most stringent existing permit limit (or the maximum reported effluent concentration) and the most stringent CTR-based effluentlimit (concentration) to pounds per year by multiplying this difference by the facility's average daily flow rate (design flow rate for municipal dischargers). EPA calculated annual pollutant loading reductions for each of the pollutants analyzed at each sample facility for which costs were estimated. The average load reduction then was calculated across sample facilities within each discharge category and extrapolated to the universe of facilities by multiplying the average load reduction by the total number of facilities in the category (EPA extrapolated facility specific costs similarly).

As indicated above, where pollutant monitoring data indicate detectable quantities of a pollutant, EPA used maximum effluent concentrations to estimate both pollutant loading and potential costs. Under this scenario, the methodology may result in overstating pollutant loadings and benefits. However, the assumption will also overstate compliance costs to reduce pollutant discharge concentrations. EPA chooses to err on the side of overstating costs to ensure that all potential costs are counted. EPA disagrees with the commenter's opinion that pollution prevention is not an appropriate treatment for these pollutants merely because they have been banned for some time. Lingering stockpiles or residential use of banned substances may still be releasing these pollutants into the environment and an aggressive pollution prevention program including source controls and public education should be successful in controlling these substances.

One exception, however, occurs under the low scenario. Where the Agency assumed that a facility would pursue regulatory relief, rather than end-of-pipe treatment, no load reduction is credited to the facility, while a nominal cost is incurred to pursue the regulatory relief. In other words, costs increase with no concurrent benefits.

CROSS REFERENCES

Comment: As background, the City of Woodland is a small community with a population of 43,250. We operate a 6.0 million gallon per day (mgd) secondary treatment plant which discharges to Tule Canal, a constructed agricultural drain located within the Yolo Bypass. Tule Canal is an effluent dependent water body. Except for periods when the Sacramento River overflows into the bypass, Tule Canal flows are dependent upon agricultural drainage and the plant effluent. During most of the year, canal flows are dominated by agricultural drainage.

In 1994, the City conducted an effluent and receiving water quality assessment. The purpose of the assessment was to characterize toxic pollutant levels in the plant effluent and the receiving water,

determine effluent dilution, and assess whether the discharge, had a reasonable potential to cause or contribute to an exceedance of either existing or potential water quality objectives for toxic pollutants. The toxic pollutant sampling was conducted using clean sampling techniques and proper QA/QC. In 1996, a supplementary sampling monitoring program was conducted to gather additional data on several of the toxic pollutants of concern. Based on the combined results of the 1994 and 1996 monitoring programs, the City concluded that there may be a reasonable potential for exceedance of several existing and potential toxic pollutant objectives (including aldrin). In that same year, the City developed a water quality compliance strategy to address the problematic toxic pollutants (see Exhibit A).

We have reviewed the proposed CTR and offer the following comments:

3. The proposed rule could cost the City approximately $1.3 million annually without providing commensurate environmental benefits. The Regional Board does not allow the City a dilution credit and therefore we would have to achieve the aldrin criteria (and possibly other criteria) in our undiluted effluent. This would require that maximum observed aldrin levels (0.01 ug/l) be reduced by 98.6% (to 0.00014 ug/l). A reduction of this magnitude is not feasible through pollution prevention because only 4% of the aldrin has been identified as coming from industrial sources. Residential sources account for 55% and other unidentified sources account for 41 % (see Exhibit C). The least costly alternative for achieving an effluent limitation based on the aldrin criteria would be to remove the discharge from Tule Canal and construct a 7-mile outfall to the Sacramento River (where significant dilution exists). This would have a total present worth cost of $9.4 million (see Exhibit A, Tables 5 and 6). This would translate to an annual cost of $1.3 million per year (at 7% over 10 years) and would require about a 50% increase in monthly sewer service charges. This substantial cost would not produce measurable benefit on Tule Canal in that the canal is dominated by agricultural drainage, which contains pesticides and other toxic pollutants. For example, Tule Canal mercury levels upstream of the plant discharge have been measured at levels of 0.15 ug/l, three times the proposed CTR criterion for mercury (see Exhibit A, page 5). Irrespective of this, the City has developed a source control strategy for aldrin and other pollutants of concern (see Exhibit D). A major element of the strategy is the implementation of a pesticides outreach program, now underway (see Exhibit E).

Response to: CTR-044-004

EPA disagrees with the City of Woodland that a $9.4 million construction project would be required to ensure compliance with the CTR-based limit for aldrin because pollution prevention cannot feasibly ensure compliance with the CTR-based limit. The City of Woodland's own analysis of aldrin effluent monitoring data (Larry Walker Associates, WPCF Water Quality Compliance Strategy, Task 14.4, November 1996) states that "significant uncertainty exists as to the actual amounts present." Aldrin was detected above the detection level of 0.006 ug/L only twice out of 13 data points (0.0063 ug/L and 0.01 ug/L). Since sampling data for aldrin are limited and generally reflect that aldrin is not detected, EPA would assign pollution prevention to ensure that aldrin levels remain below detection levels and in compliance with the CTR-based limit. Woodland's current pollution prevention program involves education and outreach, methods which can be successful in reducing residential and miscellaneous inputs of aldrin to the system. However, if Woodland's public education and outreach program does not produce the desired result, Woodland may need to better identify miscellaneous sources (41% of aldrin sources based on the Larry Walker report) for source control or other pollution prevention measures in order to control aldrin levels.

See responses to CTR-056-018 and CTR-021-008.

EPA acknowledges that it was unable to monetize all categories of potential benefits from the rule. EPA

provided a qualitative description of the expected benefits and those unmonetized benefits that may contribute most substantially to total benefits in the final Economic Analysis of the CTR.

Comment: EPA has greatly understated the potential attainability problems associated with the CTR. This also includes numerous erroneous assumptions made in the EA, such as those described by BADA, CASA/Tri-TAC, and M.Cubed. Larry Walker Associates prepared an Attainability Analysis for the BADA agencies, copy attached. That analysis concluded that BADA agencies will not be able to comply with effluent standards for copper, nickel, pesticides (Aldrin and Heptachlor), and PAHs [Benzo(a)Pyrene, Dibenzo(a,h)Anthracene, and lndeno(1,2,3-cd)Pyrene]. Removals ranging from approximately 20% to nearly 90% will be required. Without major revisions to the CTR, the cost for compliance will be more than $130,000,000 annually. These costs represent only the BADA agencies. Actual costs for all POTW dischargers to San Francisco Bay would be at least an additional 40%, bringing the total annual cost for San Francisco Bay ratepayers to more than $185,000,000 on a strictly flow proportional basis. Since the non-BADA POTWs are significantly smaller, capital costs would actually increase due to loss of economy of scale. Therefore, actual costs for San Francisco Bay could easily exceed $200,000,000 per year - all for the sole purpose of removing between 1-10% of the "Estimated Share of Toxic Loadings Attributable to Point Source."(*1)

Comment: Cost Estimates for East Bay Dischargers Authority Compliance with the CTR

The following table summarizes the costs for compliance with the CTR. The costs are based on data and methodology used in the EA.

Pollutant	Remedy	Capital Cost ($M)	Annual O&M ($M)	Annualized Costs ($M)	
copper	pollution prevention	NA	NA	0.057	
organics	carbon adsorption	116.4	19.4	44.2	
TOTAL		116.4	19.4	44.26

Comment: The proposed CTR contains several criteria that could result in annual costs for BADA agencies alone of between $68 million and $134 million per year. BADA has conducted an attainability analysis based on effluent data collected by BADA agencies over the past several years, ambient data collect as a part of the Regional Monitoring Program, and the current Basin Plan dilution policies. Both the effluent and ambient data were collected using clean sampling techniques and analyzed using proper QA/QC procedures. An initial review of the State Implementation Policy indicates that the policy would not result in any loosening of the current Basin Plan dilution policy and, in fact, could result in a more restrictive policy.(*1) BADA's attainability analysis also assumed that an additional 10% reduction in problematic pollutants could be achieved through pollution prevention. The CTR economic analysis assumed a 10% to 25% reduction through pollution prevention, but BADA agencies have been implementing pollution prevention for years and would not expect significant additional reductions beyond those already achieved. All BADA agencies have extensive public education and pollution prevention programs and several have won national awards for their source control programs. BADA's analysis assumed that the Regional Board would accept and utilize metals translators developed in

accordance with EPA procedures. BADA used the RMP ambient data to develop the metals translators. BADA's analysis assumed lime precipitation would be utilized where metals removal was necessary and carbon absorption would be utilized where organics removal was necessary. BADA evaluated two lime precipitation scenarios, the addition of lime to primary tanks as EPA assumed in its economic analysis and tertiary lime treatment. BADA evaluated the cost of tertiary lime treatment because we believe EPA's assumption regarding the efficacy and cost of primary lime addition to be overly optimistic. BADA does not believe it is possible to achieve the low effluent values required to comply with the copper criteria through addition of lime to the primaries. Further, BADA believes EPA was incorrect in assuming that lime could be added to primaries without significant capital cost. Adding lime to primaries, at a minimum, would greatly increase the amount of sludge produced, thereby necessitating additional sludge handling and processing facilities. For these reasons, consultants have generally recommended tertiary lime treatment to achieve the effluent copper levels required to achieve the proposed criteria. Finally, BADA's analysis used 1996 costs, amortized at 7% interest over ten years, just as EPA did in its analysis. In estimating the cost of lime addition to the primaries, BADA used EPA's costs for lime treatment. The results of BADA's attainability analysis are presented in Attachment 2. The analysis shows that after pollution prevention all five BADA agencies would have problems complying with one or more of the proposed criteria. Three agencies would have problems with dissolved copper criteria for protection of aquatic life and two agencies would have problems with carcinogen criteria for protection of human health (aldrin, PAHs, or heptachlor). The estimated annual cost to achieve compliance varies between $68 million and $134 million per year depending on the assumption regarding lime treatment. The lower cost was based on EPA's assumption that lime could be added to the primaries to achieve the effluent limits without any capital cost. The higher cost was based on the assumption that tertiary lime treatment would be necessary to achieve the effluent limits. The lower costs include $12 million per year for lime treatment to achieve the copper effluent limitations and $56 million per year for carbon absorption treatment to achieve the effluent limitations based on carcinogens. The higher costs include $78 million per year for lime treatment and $56 million per year for carbon absorption treatment. Again, this is not a worst case scenario in that BADA assumed translators would be allowed (even though the Regional Board has not made it a practice to accept translators) and assumed continuation of the present dilution policy (even though the Draft State Implementation Policy would allow the Regional Board to deny dilution credits for deepwater dischargers).

(*1) For example, on page 13, the Draft Implementation Policy states: "The RWQCB shall consider denying or significantly limiting a mixing zone and dilution credit if the discharge contains pollutants that are carcinogenic, mutagenic, teratogenic, persistent, bioccumulative, or attractive to aquatic organisms." Literally all POTW discharges contain pollutants such as mercury that are bioccumulative and materials such as chloroform that are carcinogenic. Thus, the Draft Implementation Policy would allow the San Francisco Bay Regional Board to eliminate the 10: 1 dilution credit currently afforded to deep water dischargers.

Response to: CTR-054-005

EPA disagrees with BADA's cost estimates. EPA estimated costs to POTWs for the entire state of from $7.8 million to $41.6 million annually compared to BADA's estimate of $68 million to $134 million annually. As BADA points out in its comment, EPA uses a different standard when assigning pollution prevention costs (see response to CTR-004-003 for a discussion of EPA's methodology for applying pollution prevention costs). EPA's analysis assumes that facilities will try to meet CTR-based limits using the least cost option and, for loading reductions between 10% and 25%, EPA believes that pollution prevention or process optimization are the more likely options over end-of-pipe treatment.

In EPA's economic analysis for the final CTR, it assigned both lime addition to primary tanks and tertiary lime treatment based on individual facilities' existing treatment, CTR-based limits, and required loading reductions (see the response to CTR-040-032). EPA did consider sludge disposal where relevant and estimated residuals removal costs for those facilities.

The differences in load reductions (and thus the treatments considered necessary to meet CTR-based limits) between BADA and EPA's analyses result from different baselines in the two analyses. BADA uses a 99.9% probability estimate for metals and the maximum observed concentration for organics as its baseline to estimate loading reductions. EPA uses the existing NPDES permit limit or, in the absence of an existing limit, the maximum effluent concentration to estimate loading reductions which are then considered when assigning costs to reach the necessary load reductions.

EPA did not assign costs mechanically based on unrealistic guidelines and statistical procedures to predict worst-case effluent quality as a means for determining compliance as was done in the BADA analysis. EPA's cost decision matrix allowed for the consideration of the available data in the context of detection limits, facility processes, and potential irregularities in plant operations which might result in abnormally high data. EPA believes that it's methodology is more accurate in its evaluation of data and its estimation of costs than the BADA methodology.

Comment: Given the limited time available to respond to the proposed CTR, an attainability assessment for one pollutant, copper, as the primary pollutant of concern for EBMUD was conducted (it should be noted that the District also has concerns over organic pollutants where detection limits are greater than the proposed criteria). The analysis was conducted and is presented as percentage reductions necessary to reach three levels of probability for achieving 4-day average limits:

* 95% Probability would require a 0 to 7% copper reduction. The District believes that such reductions could be achieved within 0 to 5 years by continued focus on pollution prevention measures. Current costs for pretreatment are approximately $570,000/year, and the cost of pollution prevention approximately $546,000/year.

* 99% and 99.9% Probability would require up to a 19% and 30% reduction respectively; this could only be attained through advanced treatment facilities beyond that which presently exists.

Since 1974, influent copper loadings have been reduced from 318 kg/day to 17 kg/day in 1996 (i.e.

94.7%). Pollution Prevention efforts since 1988 have resulted in a 39% reduction from 28 kg/day to 17 kg/day. In 1996 wastewater treatment resulted in a further reduction to an average effluent discharge of 5.2 kg/day. To reduce the discharge of copper by an additional 30% from 5.2 kg/day to 3.64 kg/day would result in a capital cost of $42 million and an annual O&M cost of $5 million per year. This is based on the assumption of having to treat approximately 30% of the plant flow (i.e. 22 MGD) to remove copper using the lime precipitation process. This estimate compares closely with an independent estimate of $39.2 million capital cost and $4.6 million per year operating cost performed at EBMUD's request by the consulting firm of Larry Walker & Associates.

If the EBMUD information is an example, there can be no doubt that the $15 to $87 million per year EPA cost estimate, which is supposed to have included debt service on capital investments, is a gross understatement of the true costs statewide.

Comment: Historical monitoring data for the seven water WRPs have shown that plant effluent concentrations will not reliably meet the proposed CTR criteria for mercury, lindane and four trihalomethanes (bromoform, chlorodibromomethane, chloroform and dichlorobromomethane). Our preliminary evaluation of the feasibility of employing source control or pollution prevention as the principal compliance strategy indicates that these options are likely to yield only very small reductions in loadings for these pollutants. Thus, to ensure reliable compliance with the CTR, reverse osmosis (RO) at the Sanitation Districts' seven WRPs would be necessary. The preliminary cost estimate for providing RO at each of the seven WRPs is significant. The total annualized cost is approximately $148 million. To put this into perspective, the addition of RO treatment would double or triple the single family home sewer system rates for the areas serviced by these facilities.

Response to: CTR-059-001

EPA is not able to evaluate LACSD's assessment that reverse osmosis (RO) is required at each of the WRPs which are not in compliance with the CTR-based limits because LACSD does not provide monitoring data or any other details with which EPA can perform an analysis. Thus, EPA disagrees with LACSD's $148 million cost estimate for the WRPs. EPA estimates that costs to POTWs for the entire state will range from $7.8 million to $41.6 million. See responses to CTR-045-012b, CTR-004-003, and CTR-005-004.

Comment: * The EPA should reevaluate their determination under the Regulatory Flexibility Act that the rule will not have a significant economic impact on a substantial number of small entities. OVSD would be classified as a small entity, serving a population of 25,000, and would be significantly affected by the CTR. OVSD would have to further treat our effluent with reverse osmosis in order to comply with proposed CTR criteria, specifically for copper, nickel, zinc, lindane, and trihalomethanes; modifications to the existing plant would result in estimated increased annualized costs of $1.98 million. These costs are significantly higher than EPA's estimated costs per plant of $27,000 to $480,000 per year. In addition, EPA must consider that OVSD's contingent of small businesses potentially will be affected by the proposed rule through increased regulation of their discharges, increased sewer discharge fees, or product bans. Thus we strongly believe that the EPA's Economic Analysis significantly underestimates the potential statewide costs associated with adoption of the CTR and should be revised.

Comment: Economic analysis The attached table shows that implementation of the proposed limits will result in the reduction of SASM's copper limit from 37 ug/l to 12 ug/I. It is expected that reverse osmosis will be the most economical method to reach this level and that the cost of this operation will be approximately $550,000 per year. This equates to a 30% increase in SASM's budget. This cost is also higher than EPA's estimated costs of $27,000 to $480,000 per plant per year. It appears that the Economic Analysis underestimates the potential statewide cost and should be revised.

Comment: As discussed in the February 12, 1998 telephone conversation between Mr. Mitchell of your office and William Straub of my staff, enclosed for your information and use is a copy of an April 1992 report summarizing anticipated compliance efforts and costs that the City compiled in response to the State Water Resources Control Board's 1991 adoption of the Inland Surface Waters (ISWP). Although the compliance costs were estimated specifically for our DC Tillman Water Reclamation plant in Van Nuys, we believe that per-MGD unit costs are valid for our Los Angeles-Glendale Water Reclamation Plant as well (the estimated costs are summarized on Pages 11 and 12 of the report's Executive Summary).

As indicated in our oral and written comments (September 18, 1997 public hearing and September 26, 1997 letter), the proposed California Toxics Rule's July 1997 Economic Analysis (EA), based in part on the Tillman facility as a case study, misrepresented the true compliance cost impact to the City. The EA, in effect, compared the proposed criteria to the waste discharge requirements of the Tillman plant's existing NPDES permit and concluded that the cost impact would be minimal. However, the plant's 1991 permit was based on the ISWP, which itself anticipated the criteria contained in the proposed Rule. The Tillman plant was the only POTW in the region to be repermitted using these criteria; because of mounting POTW discontent following ISWP adoption, (which ultimately led to the invalidation of the ISWP in 1994), all other POTW permits were renewed using Basin Plan objectives, PQLs and National Toxics Rule criteria. The 1991 Tillman NPDES permit renewal resulted in immediate compliance problems for the plant, and for this reason we believe that the EA cost figures should consider the cost impacts of the proposed Rule from a pre-1991 point of view. The enclosed report approaches these costs from that perspective.

Updated cost estimates for the City's Tillman and Los Angeles-Glendale reclamation plants were recently prepared by the Bureau's Industrial Waste Management Division in response to the release of the proposed Rule. These include:

* Process optimization. Operational modifications to the Tillman and Los Angeles-Glendale plants necessitated by the proposed Rule involve capital costs in the range of millions of dollars and annual O&M costs between $50,000 to $200,000 per plant.

* Pollution Prevention/Waste Optimization. Based on past outreach programs and pollution prevention studies, the proposed Rule would cost about $500,000. In view of the present industrial discharger compliance rate (better than 95%), this effort might have only a marginal beneficial impact.

* Pretreatment Program. Based on studies conducted in the early 1990's, the cost of each pollutant requiring local limits development is about $15,000. Tables I and 2 (attached) summarize constituents which would be problematic under the proposed Rule. The cost of new local limits development for these pollutants would exceed $250,000.

The EA also did not include actual costs incurred by the City resulting from compliance studies required by the Los Angeles Regional Water Quality Control Board. These included:

* A numerical chronic toxicity limitation that resulted in 5 years of toxicity testing costing in excess of $200,000 (other POTWs in the area were granted narrative toxicity limits);

* Industrial source-controllability studies costing $110,000 for methylene chloride, lindane and other pesticides that were determined to be of domestic origin and therefore not controllable by the plant;

* Numerous and ongoing efforts on the part of the Bureau of Sanitation to obtain relief from the Los Angeles Regional Water Quality Control Board based on plant performance data demonstrating that ISWP-based limits were neither equitable nor achievable. We would greatly appreciate your consideration of these costs and the estimated costs contained in the enclosed report with respect to EA revision. If you should have any questions, or wish to discuss actual compliance costs incurred since 1991 in greater detail, please contact William Straub at (213) 485-1820.

Comment: I don't want to go into what's presented in writing, but as a discharger, our first evaluative criteria of this rule was attainability.

Our analysis is based on the information from our member agencies, and it indicates that the ability of publicly owned treatment works to meet all the criteria is seriously questionable.

For the record, all the dischargers in BADA have extensive public education programs. We have pollution prevention programs. We have award-winning source control programs.

We base our analysis on using actual data that we filed with NPDES permits over the last two years and current regulatory criteria. All the agencies would have attainability problems.

Three agencies would have problems with dissolved copper, three agencies with the organic/carcinogenic compounds. And in fact, we believe as the detection limit approaches permit limits, that all agencies would violate the carcinogenic requirement.

At present, there is no data on these constituents in the environment, in the receiving waters, or in our influents. Most of the data is nondetectable, because of the limits of detection.

It assumes that pollution prevention can identify and control these organic compounds at below parts per trillion. That is highly speculative.

Despite the assumption made in the plan of regulatory relief, treatment has been the method used to remove pollutants from our waste water effluent. If the agencies have to remove copper by relying on lime precipitation, using EPA's own numbers which contain no capital cost for handling the solid material and sludge generated, which is no minor problem, would require considerable capital cost. It would cost our agencies on a yearly basis $12 million.

To remove the organics that is required, it would require probably using technology like powdered activated carbon, and based on EPA estimates for this process, the cost to those agencies, just the three, would be $56 million a year.

We believe that other of our agencies would probably be added as detection limits and the reporting limits are lowered, since MLs would offer only temporary relief, until the detection limits show that these organics are pervasive in the environment.

So just this attainability cost -- based on data of the last two years for five agencies serving three and a half million people in the Bay Area, the cost is $68 million a year. That approaches the maximum cost projected for the state.

If we look at the projected benefits of the increased treatment and cost to our taxpayers, with point dischargers being less than 10 percent of the loading, and the lack of looking at the benefits analysis, we tend to lead people to believe that waters would meet these criteria based on just control of point sources. Actual or passive, one has to wonder what the benefits really are to the public.

If BADA agencies increase treatment to remove copper, for example, an additional 2,400 pounds of copper would be removed per year. That's about a 1 percent benefit to San Francisco. Since there is no data on carcinogenics we are talking about parts per trillion here -- the benefits become even more specious.

This analysis has not factored in more restrictive ambient background concentrations, water effect ratios, water hardness, et cetera. The hope of holding out ambiguous regulatory relief as a method of avoiding treatment costs does not seem consistent with the general trend of regulations, despite the mood of Congress or the public in general.

BADA agencies appreciate the work of EPA staff on the California Toxics Rule. We are willing to provide further data or case studies, if needed, to improve this document.

We have already, and will in the future, optimize and improve the treatment operations, increase pollution prevention and participate in studies to better define the course of action that should be taken to improve the environment and human health.

I thank you for letting me comment.

EPA acknowledged that increased angling activity at sites experiencing reductions in toxic contaminants may reflect a shift in activity from substitute sites rather than a net increase. Because EPA could not account for substitute sites in this analysis, EPA estimated lower bound benefits of $0 (i.e., assuming no net increases in activity; see Chapter 8 of EA).

Comment: The CTR Inappropriately Extrapolates the Results of Copper and Nickel Industrial Mass Audits to Project the Measures, Cost and Feasibility of Compliance with Organics Limits

The CTR cites the mass audit studies conducted by Sunnyvale and San Jose for copper and nickel as the basis for the estimated $61,526 cost per significant industrial user (indirect discharger) affected by new permit limits. It is a significant extrapolation, if not distortion, to use the results of those studies to project pollution prevention and waste minimization costs for other constituents, particularly trace organics. Those studies did not address organics and there is minimal basis for assuming that the types of measures recommended to address copper and nickel, and therefore costs, and the number of affected industries (CTR assumes 10-30% of total SIUs) bears any relationship to the costs and numbers of organics from local sanitary sewer dischargers. The measures identified in the mass audits were also the easiest and most cost-effective to implement. In the instances where there were additional potential control measures identified, they were considerably more expensive. EPA ignores non-SIUs which may represent up to as much as 75% of POTW regulated industries.

Response to: CTR-021-011

See the response to CTR-040-037.

EPA disagrees with the commentor's assertion that the costs for San Jose and Sunnyvale cannot be used to extrapolate costs to indirect users at other POTWs. The procedures for identifying indirect sources contributing specific pollutants to POTWs and developing and implementing a source control plan to minimize these discharges are similar for all types of pollutants. Additionally, similar to San Jose and Sunnyvale, metals were the primary pollutants of concern for POTWs evaluated in the cost analysis. Apart from these studies, EPA has no data upon which to establish facility-level compliance costs for indirect dischargers. To account for this uncertainty, EPA has revised its assumption regarding the percentages of indirect dischargers that may incur these costs. The percentage of facilities that may incur these costs was revised from the initial estimate of from 10% to 30% to a new estimate of from 30% to 70%. EPA believes that these new estimates are highly conservative (i.e. tend to overestimate costs).

Average per facility investment costs for industrial participants were estimated using the mass audit studies for copper and nickel pollution prevention projects with paybacks of less than five years. The average cost per indirect discharger was estimated to be $61,526 or $15,000 per year at an interest rate of 7 percent and over a period of five years. The total annual costs to the indirect discharger population in California then were estimated by multiplying the annualized cost ($15,000) by the total number of potentially affected indirect dischargers.

Under the MAS, the pounds removed by the pollution prevention projects with paybacks of less than five years were 560 pounds per year for copper and 148 pounds per year for nickel. Since neither San Jose nor Sunnyvale required nickel reductions under the water quality criteria in the final CTR, EPA did not consider pounds removed. Both San Jose and Sunnyvale did require copper reductions under the high-end cost analysis. For San Jose, copper reductions required to comply with the WQBEL equaled approximately 746 non-toxic-weighted pounds per year, however, for Sunnyvale, required reductions equaled 87 pounds per year. Thus, the MAS indicates that copper reductions would be adequate to meet Sunnyvale's required loading reductions, however, they would not be adquate to meet San Jose's required loading reductions.

EPA estimated the costs for POTWs to implement waste minimization/pollution prevention programs which included capital costs for source controls for indirect dischargers. This double counting of costs associated with waste minimization/pollution prevention will cover any new or additional pollutant reduction that is required of a POTW or indirect discharger to meet the WQBEL. The double counting may be more than enough as 90% reduction is not necessary under the rule, even in San Jose's case. Only a small additional redcution is required, thus, this additional capital could be used to reduce the copper load with controls at indirect dischargers.

Comment: * In general, we are pleased that EPA prepared an analysis of the economic impacts of the proposed CTR, and that a major portion of EPA's work focused on determining the potential impacts on POTWs. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Detailed comments can be found in Attachment 2. A few of the areas of concern are listed below:

* Small facilities appear to be under represented in EPA's sample of POTWS, especially for minor dischargers.

* The cost triggers used as regulatory relief thresholds are unrealistic, and are not consistent with EPA regulations and policies.

* The assumptions used to determine cost estimates for indirect dischargers appear to omit a large proportion of potentially affected industries.

* The Economic Analysis does not take into account projected population and industrial growth over time, which may influence effluent quality and quantity. Statewide, the population is projected to grow by nearly 50% by 2020.

* The use of average cost estimates masks economic impacts on individual dischargers, which may be particularly acute for small communities.

* The economic Analysis ignores the costs that may be incurred by stormwater dischargers and nonpoint sources to reduce loadings so that CTR criteria may be met in ambient waters.

Comment: Finally, we have serious concerns about the accuracy of the draft Economic Analysis and the estimates of the costs and benefits of the draft CTR (see detailed comments in Attachments I and 2). Our primary concerns related to the cost analysis include 1) that the case studies on which the cost analysis is based do not adequately represent the actual population of POTWs in California; 2) the omission of costs that could be incurred by many sectors that contribute to overall loadings, and, hence, can be expected to have to reduce their loadings (e.g., non-SIU indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources of CTR-regulated pollutants); 3) the use of numerous assumptions that underestimate costs; and 4) the capricious removal of costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the lack of any proposed regulatory relief trigger in the proposed regulation.

To illustrate the degree of underestimation of costs for the POTW sector alone, we looked at potential compliance costs for the POTW sector. We found that the potential costs for 23 major POTWS. on an annualized basis, may reach $400 million. We believe that this analysis demonstrates that the potential cost consequences of compliance with effluent limits based on the proposed CTR criteria would easily exceed the $ 100 million annual cost threshold, especially when the costs of all 313 POTWs in the State are estimated. Thus, we believe that EPA must conclude that the proposed CTR could have significant economic impacts on local governments.

Comment: pp. 2-38 - 2-39 (US EPA, 1997b) -- Cost Estimates for Indirect Dischargers By only including Significant Industrial Users (SIUs), EPA drastically underestimated the costs to indirect dischargers to POTWs, and thus to many of the industries of the State. EPA ignores non-SIUs, which may amount to as many as two-thirds of the permitted industries discharging to a POTW. EPA also does not take into account the businesses that POTWs might have to start regulating, such as dentists for source control of mercury, auto repair shops for metals, and veterinarians for pesticides used for flea control (e.g. lindane, diazinon), which could cumulatively number in the thousands. EPA also used assumptions about indirect dischargers based on an analysis of compliance costs for the Great Lakes Initiative, which showed that between 8 and 44 percent of indirect dischargers could be affected by new permit limits on POTWS. EPA used a range of 10 to 30 percent, based on that analysis. EPA appears to have done no analysis of California industries see what the distribution is by SIC code, and then determined what adjustments might be necessary to use a comparison to the Great Lakes States industrial base. Without this, there is simply no evidence that the assumptions used have anyvalidity for the California economy. For instance, at least in some parts of California, a higher proportion of industries are indirect dischargers than is the case elsewhere in the country. Additionally, to estimate individual indirect discharger costs, EPA used figures based on studies in San Jose and Sunnyvale. EPA provides no rationale for extrapolating from a single area and a few limited types of industries to the wide range industries in California, which may have very different products, treatment processes, and waste streams. To do a credible cost analysis, EPA must thoroughly examine the impacts of the CTR on indirect dischargers in California.

Comment: 5. Concerns Regarding Economic Analysis

The District also has several significant concerns with the Economic Analysis that was performed for the proposed rule. Concerns about the cost estimates made for both the District and the state are presented here. (See attached Review of EPA's Economic Analysis of the Proposed California Water Quality Toxics Rule.) Overall, the District believes that problems with the Economic Analysis are serious enough that is should be redone. As stated above in our analysis of assumed costs at the SRWTP, the use of questionable data without qualification combined with unsubstantiated assumptions regarding costs to achieve compliance resulted in a gross underestimate in the cost-effectiveness ratio. The District's first concern is that if the types of problems found in our Case Study are widespread in other studies, the complete analysis is suspect.

In addition to the analysis of the District's facilities, there are several other points which have been used by EPA to lead to a potentially serious understatement of actual costs. The key assumptions involved are that: 1) no costs would occur if either no monitoring data presently exists or if that data is below analytical detection levels; 2) no treatment costs would occur whenever EPA's initial estimates showed high costs, due to successful regulatory relief; 3) no costs are included for nonpoint sources such as municipal stormwater management systems; and 4) no costs are included for indirect dischargers to the District's system that are not large enough to be considered a Significant Industrial User (SIU).

Regarding the first assumption, the District has found that there is pressure from many sides, including the Safe Drinking Water Act, to both increase the number of constituents being monitored and to lower detection levels to meet numeric criteria set by EPA and the state. To assume that monitoring of these new constituents will not lead to any treatment cost increases is simply unrealistic. Similarly, the second assumption about absolute success in every pursuit of regulatory relief is also overly optimistic. There are no guarantees that pursuit of regulatory relief will be successful in any situation, and EPA indicates elsewhere in the preamble that options such as variances and site-specific criteria will rarely, if ever, be granted.

The third and fourth key assumptions ignore present dominating trends and facts, i.e. that. prevention and control of pollutants at their sources, including very small indirect dischargers, storm runoff, and other nonpoint sources are now the major focus of EPA's wastewater programs nationally. While we agree that these management steps should be taken, there will be significant costs attached to the implementation of these steps that cannot be ignored.

Combined with concerns the District has heard from other sources such as the California Association of Sanitation Agencies (CASA), it appears that EPA has failed to make "a reasoned determination that the benefits of the intended regulation justify its costs." Therefore the District believes that the Agency is obligated to redo the draft Economic Analysis.

Comment: EBMUD perceives there to be a significant overall economic impact resulting from CTR, contrary to the conclusions reached by EPA. Because the cost may exceed $100 million annually on the regulated community (the majority of which are publicly owned agencies), it appears that pursuant to Executive Order 12,866 and the Unfunded Mandates Reform Act, the CTR can be considered a significant regulatory action which is likely to adversely affect the economy of many regions of the State, the environment and/or local governments. EBMUD is also of the opinion that EPA failed to make a, "...reasoned determination that the benefits of the intended regulation justify its costs," and is obligated to redo the draft Economic Analysis and submit it for review by the Office of Management and Budget.

Comment: Comment #4: Policy Assumptions re Indirect Dischargers

On page 2-38 of the Analysis of Potential Costs it states:

"...it was assumed that many POTW's will select the option of controlling discharges to their collection system as a cost-effective means to comply with permit limits".

Questions for EPA on Comment #4:

The specifics of San Jose/Santa Clara's copper limit and permit performance, as detailed below, raise

several global economic analysis methodological questions. For example, in the case

a) substantial, costly, pollution prevention and pre-treatment programs are already in place for most Indirect Dischargers; b) the emphasis on point sources has reduced influent concentrations to the Plant to levels where there is no longer a significant correlation of influent concentrations to effluent concentrations; c) 90% of copper is routinely removed from the influent at the San Jose/Santa Clara POTW, making further source control only marginally effective; and d) the POTW's wastewater effluent can be proven to be very close to CTR criteria. on average; yet e) portions of the receiving waters do not meet the suggested criteria, it seems capricious and arbitrary to assume that POTW's will opt to make Indirect Dischargers responsible for additional costs, as the source of the bulk of the copper is clearly not from the Indirect Dischargers, and the attainment of the CTR criteria in the receiving water will not occur by asking these sources to make further reductions.

Q.4-1) How many of the Indirect Dischargers are operating in a POTW environment where EPA's assumption would be appropriate? How many are not?

Q.4-2) How would the EPA estimates of POTW costs vs. Indirect Dischargers cost change if this assumption about cost effectiveness were changed?

Q.4-3) With respect to costs, have any measures been employed in this analysis to recognize cumulative costs of efforts undertaken to date? To identify where dischargers (indirect or direct) are on the scale of operating economies? To identify if point source pollution reduction efforts have been successful, thus spending additional monies will be only minimally productive?

Response to: CTR-092-020

The City of San Jose (San Jose) challenges the economic analysis methodology based on its particular experience in the control of toxic substances. In particular, San Jose states that because major pollution prevention efforts have already been conducted at the San Jose/Santa Clara POTW, pollution prevention is not expected to be a successful alternative for compliance with the projected CTR-based copper limit. EPA disagrees with San Jose's statement and addresses specific concerns in the following paragraphs.

San Jose indicates that although San Jose/Santa Clara facility's copper effluent concentration can be shown to be very close to the CTR-based limit, portions of the receiving water do not meet the suggested standard. EPA agrees with San Jose that the San Jose/Santa Clara facility's copper effluent concentrations are reported most often in compliance with the projected CTR-based limit, thus, estimated compliance costs are not sizable. EPA considers, however, San Jose's statement regarding some portions of the receiving water not being in compliance to be vague. If portions of the receiving water would not meet water quality standards when the San Jose/Santa Clara discharge is in compliance with its CTR-based permit limit, then a TMDL may need to be developed for the water body to ensure water quality protection. If the TMDL shows that water quality standards violations are caused by neighboring sources, then these sources would need to be controlled and related costs would not be attributed to the San Jose/Santa Clara facility.

San Jose states that it seems capricious and arbitrary to assume that POTWs will opt to make indirect dischargers responsible for pollution control costs when this may not be the case. EPA believes that San Jose's statement is inaccurate. The EPA's Economic Analysis estimates a statewide cost and is based on assumptions that apply to the majority of dischargers. If an individual facility, such as San Jose, believes that further controls on indirect dischargers are not necessary, then this specific situation would need to be addressed by the facility in a different manner. In order to account for this situation, EPA

assumed in its economic analysis that 30% of indirect dischargers would be impacted in the high scenario and 70% of indirect dischargers would be impacted in the low scenario which reflects that a greater proportion of the implementation costs would fall on POTWs under the high scenario. Nonetheless, EPA believes that the largest portion of toxic constituents received by POTWs are from indirect dischargers, thus pollution prevention, including source control efforts, will be able to ensure compliance with projected CTR-based limits.

Regarding San Jose's question about how many indirect dischargers would be targeted to reduce toxic discharges to POTWs (Q.4-1), EPA did not have adequate information to evaluate all individual indirect dischargers as part of its economic analysis, thus EPA is not able to give numerical estimates of the exact number of indirect dischargers discharging to POTWs that will be affected by this rule. However, to compensate for data limitations, EPA increased its estimate of indirect dischargers affected by the CTR from 10% to 30% used in the proposal to 30 to 70% used in the economic analysis for the final rule. EPA believes that this assumption dramatically overstates the number of dischargers affected by the CTR, but has done so to ensure that costs remain conservative, i.e., erring on the side of higher costs.

San Jose's second question (Q.4-2) is incomplete and, thus, EPA cannot prepare a response. San Jose is asking how costs would change if the assumptions used to estimate indirect costs were different, however San Jose does not indicate what the new assumptions would be. There are numerous other assumptions which could be employed to estimate indirect costs, however EPA cannot address them all and feels thatthe methodology used in the Economic Analysis was reasonable.

In response to San Jose's third question (Q.4-3), EPA did consider documented pollution prevention efforts implemented by the sample facilities in its evaluation and estimation of costs. However, having a successfully implemented pollution prevention program does not automatically disqualify a facility from being assigned pollution prevention costs in EPA's economic analysis. In the case of San Jose, effluent concentrations for copper and silver are reported below projected CTR-based effluent limits for all except one data point. Under this high compliance rate, addition of treatment is not justified, and EPA estimates that the facility would implement a pollution prevention program to ensure continued compliance (e.g., by addressing intermittent discharges). In addition, it should be noted that a pollution prevention program implemented to achieve an existing limit, although successful, may not necessarily comprise the same activities and level of effort as a program that would be implemented to ensure compliance with a new and more stringent limit (i.e., a CTR-based effluent limit).

Comment: Economic Analysis

The Sanitation Districts commends EPA for preparing an analysis of the economic impacts of the proposed CTR, and for selecting POTWs for half of the case studies. We believe that EPA is correct in thinking that POTWs are likely to experience major impacts as a result of the promulgation of the CTR. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Our own attainability and cost analysis indicates that there are indeed fundamental flaws in the cost analysis. A few of the areas of concern are listed below:

* The assumptions used to determine cost estimates for indirect dischargers, such as only considering significant industrial users (SlUs), assuming that only 10 to 30 percent of the SlUs would be required to implement control measures, and estimating that the average cost per indirect discharger would be just $15,000 per year, appear to omit a large proportion of potentially affected industries and drastically underestimate potential costs.

Comment: Comment #2: Estimation of Costs for Indirect Dischargers

[Re: Page 4-9 of the Economic Analysis; also Page 2-38 of the "Analysis of Potential Costs Related to the Implementation of the California Water Quality Toxics Rule"]

The methodology for estimating costs of implementing the CTR for all the Indirect Dischargers in the state relies on data from the October 1994 Mass Audit Studies (MAS) prepared by indirect dischargers for the San Jose/Santa Clara and Sunnyvale POTW'S. The pages cited above state that "...the average cost per indirect discharger was estimated to be $61,526 or $15,000 per year..."; the former figure being a raw project cost, and the latter, an annualized payment, assuming 5 year amortization at a 7% interest.

Our review of the San Jose/Santa Clara (only)-related MAS data, as tallied in the October 1994 report, presents a very different "average" picture. Specifically, the average per facility project cost figure which can be documented is $135,017 for both copper and nickel projects. Using the same financing assumptions as EPA, that raw cost would generate an annualized cost per facility of more than $30,000 per year.

We believe that these findings cast serious doubt on how the data were interpreted and then utilized for the estimate of costs to Indirect Dischargers. The City has further strong concerns about the validity of using data for projects related to only two priority pollutants (copper and nickel) to represent costs, statewide, for the multitude of pollutants which Indirect Dischargers (and the City) may now be faced with compliance on, given implementation of the CTR.

Of further concern is that the range of project costs for San Jose/Santa Clara Indirect Dischargers is from $2,940 to $928,100 per facility for copper removal projects and $500 to $543,565 per facility for nickel removal projects. Use of a single average cost to represent these widely variable ranges substantially obscures the real cost impacts on the local level and on individual businesses.

Questions for EPA on Comment #2:

Q.2- 1) Based on the San Jose/Santa Clara MAS data which was given to EPA, as cited above, how could the inclusion of Sunnyvale data with San Jose/Santa Clara MAS data bring the average raw cost per facility down from approximately $135,000 to just over $61,500?

Q.2-2) Given the MAS data cited above, it seems unreasonable to allow an average figure to serve as a proxy for costs for Indirect Dischargers statewide. Did EPA undertake some sensitivity analysis to explain the impact of a widely variable range of potential project costs and how that would affect costs to individual Indirect Dischargers as well as costs to the group of Indirect Dischargers?

Q.2-3) How did EPA test for the validity of using data focused on the costs of removing only two priority pollutants by the Indirect Dischargers in one Northern California subregion to represent Indirect Dischargers, with all possible combinations of pollutants as priorities, throughout the State?

Q.2-4) Did EPA determine that the number of pounds of pollutants removed under the five year payback scenario would be sufficient to meet the CTR standards? If not, then perhaps that scenario should be tested, as it may be necessary for the Indirect Dischargers to move to the next level of removal projects analysis (the 90% removal scenario). The per pound costs of doing so can be shown to increase by a factor of over 30 times, which will have a substantial effect on the per facility cost of meeting the CTR and, therefore, change the conclusions of the current analysis.

Comment: EPA's estimates for indirect dischargers is confined to "significant industrial users" (SlUs) and ignores small industrial and commercial establishments that can be sources of toxic pollutants (e.g., vehicle service businesses, printers, dentists, etc.). In most cases, where toxic pollutants exist at levels of concern in effluent, they are not the result of SIU discharges; they are from either residential or commercial sources.

Response to: CTR-040-037

Since non-SIUs are typically not the focus of POTW regulatory programs, the Agency has assumed that the costs to control discharges from non-SIUs will be born primarily by the POTW. EPA's consideration of non-SIUs, therefore, is built into the waste minimization costs allocated to POTWs. For example, the waste minimization costs assumed for POTWs include components such as source identification, outreach and training, and source reduction strategies. These measures have been used successfully by POTWs to reduce discharges of specific pollutants from non-SIUs (e.g., mercury, silver) without imposing costly end-of-pipe treatment.

Comment: As background, the City of Vacaville owns and operates two wastewater treatment plants. The Easterly Plant has a capacity of 10 million gallons per day (mgd) and discharges to Old Alamo Creek, an effluent-dependent stream with little or no natural flow during much of the year. The Gibson Canyon Creek Plant has a capacity of 1.4 mgd and discharges to a small creek with the same name. The City has reviewed the proposed CTR with respect to its potential impact on the Easterly Plant. Because the Gibson Canyon Creek Plant serves two industrial dischargers, the City did not evaluate it with respect to the proposed CTR. Additionally, due to the City's population (< 100,000) stormwater has not been monitored for toxic pollutants. However, based on the Easterly Plant review, the City is concerned about the potential impact of the proposed rule on the City's municipal wastewater and on future stormwater operations.

Since 1993, the City has conducted an effluent and receiving water quality assessment with respect to the Easterly Plant. The purpose of the assessment was to characterize toxic pollutant levels in the plant effluent and the receiving water and to determine whether the discharge had a reasonable potential to cause or contribute to an exceedance of either existing or potential water quality objectives for toxic pollutants. The results of this assessment have formed the basis for the City's review of the proposed CTR.

3. The proposed rule could cost the City approximately $4.2 million annually without providing commensurate environmental benefits. The Regional Board does not allow the City a dilution credit and therefore we would have to achieve the CTR criteria in our undiluted effluent. A review of our effluent data indicates we would be unable to attain effluents based on the human health criteria for three carcinogens -- gamma-BHC, chloroform, and dibromochloromethane (see Attachment). The reductions in effluent levels necessary to achieve these criteria vary between 27% for gamma-BHC to 88% for dibromochloromethane. These types of reductions would not be achievable through pollution prevention. Thus, end-of-pipe treatment would be required, most likely carbon adsorption. Using EPA's estimate of costs for a 10 mgd carbon adsorption facility for the City of Merced case study, the capital cost of the facility would be $10.7 million and the annual cost would be $4.2 million (7%, 10 years). It is questionable whether this substantial cost would bring about much benefit in an effluent-dependent stream.

Comment: Comment #3: Net Costs of MAS Projects

The EPA document entitled "Analysis of Potential Costs Related to the Implementation of the California Water Quality Toxics Rule" describes the agency's interpretation of the Mass Audit study information provided by the City of San Jose for use in preparing the CTR. On page 2-39 of that document it states that:

"The studies concluded that substantial discounted net savings could accrue to their indirect industrial dischargers by implementing pollution reduction projects for which the payback period is five years or less."

Questions for EPA on Comment #3:

Q.3- 1) Isn't this statement appropriate only if the indirect discharger(s) accepts the analyst's financing and business operation assumptions, i.e. that project costs were annualized and then offset by annual operating savings? Even then would there be net savings before project costs were completely offset in approximately five years?

Q.3-2) For those dischargers who chose to pay for pollution reduction projects from current operating monies, isn't the time gap between cost offset and accumulated operating savings even longer? Is there not also the additional, (uncalculated) cost of the opportunity cost of business capital?

Q-3-3) San Jose's findings were that, for the aggregate of MAS dischargers, on an undiscounted, per pound of pollutant removed basis, there were net costs for the copper removal projects, not net savings, which effectively lengthened the payback period. How were these findings incorporated into this analysis?

Q.3-4 San Jose further found that the per pound savings (again undiscounted) for the nickel removal projects would hardly be considered substantial for most large indirect dischargers. How did EPA define "substantial"?

Response to: CTR-092-019

EPA's analysis does not include the costs of coming into compliance with existing permit limits as part of CTR compliance costs because these costs will be incurred regardless of the implementation of the CTR. In EPA's revised economic analysis of the final CTR, San Jose's high-end and low-end costs are

estimated to be $300,000 per year and $57,000 per year, respectively. The extrapolated costs attributed to San Jose in the high and low scenarios are $750,000 and $140,000, respectively, or 1.2% and 0.5% of the total projected annual costs.

For sites included in the San Jose mass audit study (MAS) that reported a payback of 5 years or less, the MAS reports aggregate total costs (over 5 years or less) for copper projects of $2.5 million compared to an annual operating cost savings of $1.7 million, resulting in an average overall payback period of 1.5 years. The MAS also reports aggregate total costs for nickel projects of $1.7 million versus an annual operating cost savings of $2.3 million for an average overall payback period of 0.75 years (MAS, 1994). The MAS does not consider alternate financing or accounting practices. In using the San Jose MAS costs, EPA did not consider that any savings would be realized and financed the entire costs at seven percent over the five years. Factoring in the operating cost savings would have resulted in lower costs over this same period.

EPA believes that the O&M savings for the nickel removal projects for most large indirect dischargers are too speculative and specific to dischargers in the South Bay area to apply to other POTWs throughout California, thus EPA discounted the savings component to add a measure of conservatism when estimating costs to the indirect discharger population.

Comment: EOA submits the following comments on the Draft California Toxics Rule on behalf of the City of Sunnyvale. Sunnyvale owns and operates a 29.5 mgd advanced secondary municipal wastewater treatment plant that discharges into the extreme South San Francisco Bay. Sunnyvale has had in place for several years comprehensive source control, pollution prevention, and waste minimization programs.

The San Francisco Bay Regional Water Quality Control Board (RWQCB) considers Sunnyvale a shallow water discharger and does not allow dilution credit in calculating effluent limits. As such Sunnyvale faces considerable difficulties in complying with end-of-the-pipe limits for copper and potentially several toxic organics that have proposed criteria lower than the analytical detection limit.

One of the key items contained in the CTR that directly impacts Sunnyvale is the effluent limit attainability analysis and cost of compliance for Sunnyvale contained in the Analysis of Economic Costs Technical Support Document and Appendix. The methodology is flawed, a number of assumptions (including basic facts) are incorrect and thus lead to erroneous results. Reliance on an incorrect analysis of the City of Sunnyvale WPCP and then extrapolation of this analysis to other California dischargers will lead to other erroneous and misleading results and conclusions.

The EPA Sunnyvale Case Study Did Not Follow EPA's TSD and Did Not Use Current Available Effluent Data and thus Contains Erroneous Conclusions

Attachment no. 1 to this memo contains a detailed analysis of deficiencies in EPA's analysis of the Sunnyvale Case Study, specifically an evaluation of Sunnyvale's compliance with calculated CTR based effluent limits (Analysis of Potential Costs TSD Appendices I-B, 11-B, II I-B). It is not clear why EPA did not employ a more straight-forward 1991 TSD based approach (Chapters 3 and 5) starting with a reasonable potential analysis based on actual data followed by effluent limit calculation. Some of the fundamental assumptions behind the approach used are flawed, leading to erroneous conclusions, some overly conservative, some not.

For example from Table I-B-4, silver was reported to be a problem since the calculated CTR limit (1.76 ug/L) was less than the current limit (2.3 ug/L) , even though the maximum historic effluent value (1.6 ug/L) was less than either limit. The CTR analysis also appears to be confusion over effluent limit averaging periods since the CTR limit of 1.76 ug/L is derived from a one day maximum toxicity based criterion yet the limit is described as a monthly average limit. Current NPDES permits in the San Francisco Bay Region do not have monthly average limits for silver. The CTR should explain how the proposed 3.8 ug/L daily maximum limit is considered protective of aquatic life.

Response to: CTR-021-008

To estimate costs related to implementation of the CTR, EPA selected a sample of point source dischargers for evaluation to represent the universe of point source dischargers to inland waters, enclosed bays, and estuaries. As described in SAIC and Jones and Stokes Associates (1997), this sample was selected based on a number of factors, including type of facility, geographic location, etc. Available dilution was not considered in selecting a sample.

However, dilution factors used to calculate water quality-based effluent limits (WQBELs) were based on the dilution allowed within the current waste discharge requirements for each sample facility. Of the 20 sample facilities, only four were provided with dilution factors; WQBELs for the remaining facilities were based on a dilution of zero. When this sample is extrapolated to the universe, over 94% of point source dischargers are estimated to not be allowed dilution. EPA believes that this is a highly conservative estimate that will likely overestimate potential costs.

Comment: Attachment 1 - Comments on "Sunnyvale Facility Summary" Appendices

ANALYSES-

As discussed in the above memo, a fundamental methodological assumption was incorrect causing bias in the ensuing technical and economic analyses. Therefore, detailed comment on the results are for the most part inappropriate. In addition, the entire analyses conducted for the City of Sunnyvale apparently utilized a dataset containing effluent data from 1991 through 1993 when more appropriate recent data (1994-1996) should have been used. However, as an illustration of how the results are biased, the following points are presented:

Appendix I-B:

Appendix I-B states that "The existing permit limits and/or the maximum reported concentrations of silver, endrin, pentachlorophenol, 1,2-dichlorobenzene, chlorodibromomethane, and toluene are less stringent than the projected CTR-based limits (see Table I-B-4)". The following discussion addresses each of those constituents:

* Silver: The CTR based average monthly limit is 1.76 mg/L and the maximum daily limit is 3.8 mg/L. The current daily maximum limit is 2.3 mg/L. Based on a reasonable potential analysis (Attachment - 2) of plant performance data from 1994 through 1996, the projected maximum concentration is lower than the CTR based average monthly limit.

* 1,2-dichlorobenzene, and toluene: The CTR based average monthly limit for each of these constituents decreased below the current effluent limit, therefore they were cited as requiring additional removal for compliance. However the City's reasonable potential analysis of plant performance data from 1993 through 1996 indicates that there is no reasonable potential to exceed the CTR based limit (i.e. values were orders of magnitude below the proposed limits).

* Endrin and Pentachlorophenol: The CTR based average monthly limit for pentachlorophenol decreased from 8.2 mg/L to 7.4 mg/L, triggering its inclusion in the CTR evaluation. During the time period of 1993 through 1996, 16 samples were analyzed at a detection limit of 10 mg/L, all of which were reported below detectable levels. Endrin was never detected in the effluent, but the available detection limits were above the CTR based effluent limit.

* Chlorodibromomethane: Currently, THMs are regulated for the City of Sunnyvale at a level of 480 mg/L as an average monthly limit for Total THMs. A reasonable potential analysis of plant performance data from 1993 through 1996 indicates that there is a reasonable potential to exceed the CTR based limit of 34 mg/L.

* Copper should have been flagged as a pollutant with reasonable potential to exceed the limit. A reasonable potential analysis of plant performance data will show that there is areasonable potential for copper to exceed the maximum daily CTR based limit of 9.27 mg/L and the average monthly limit of 5.55 mg/L. The analysis summarized in Table I-B-3, only compares the proposed site specific objective of a maximum daily limit of 4.9 mg/L to the CTR based average monthly limit of 5.55 mg/L.

* Dichlorobromomethane: This is similar to chlorodibromomethane in that a reasonable potential analysis will demonstrate that there is a reasonable potential for this constituent to exceed the CTR based average monthly limit.

Appendix II-B:

Appendix II-B states that "The existing permit limits and/or the maximum reported concentrations of silver, endrin, pentachlorophenol, and 1,2-dichlorobenzene, are less stringent than the projected CTR based limits (see Table II-B-4)". Refer to the discussion above for an interpretation of effluent concentrations for each of these pollutants.

Response to: CTR-021-014

Sunnyvale stated that the technical and economical analysis is biased because of an incorrect fundamental assumption and because the effluent data used for Sunnyvale (1991-1993) were not recent. Since Sunnyvale has disagreed with many of the methodological assumptions used for the analysis, it is difficult to determine to which specific assumption Sunnyvale is referring. Sunnyvale also raised questions regarding issues such as assigning reasonable potential in the high scenario based on existence of permit limits and the use of the projected average monthly limit to assess compliance. EPA's responses to these questions follow.

* EPA's revised Economic Analysis included the use of effluent data that were reported between January 1995 and December 1997. These were the most recent data available at the time the analysis

was completed.

* Analysis of silver effluent data indicate that this pollutant does not have reasonable potential to exceed a CTR-based limit. Thus, no compliance costs are necessary in the low scenario. However, pollution control costs are necessary in the high scenario because the existing permit limit is less stringent than the projected CTR-based limit. As indicated in the Economic Analysis, EPA determines reasonable potential to exceed CTR-based limits in the high scenario if a pollutant has an existing permit limit or if the projected effluent quality based on the facility effluent data is greater than CTR-based limits. EPA recognizes that this is a conservative assumption that may overstate costs in the high scenario if a pollutant is limited in a permit but is not actually present in the effluent.

* 1,2-dichlorobenzene and toluene do not have reasonable potential to exceed water quality criteria andthus no associated compliance costs in the low scenario of the revised Economic Analysis. However, reasonable potential and compliance costs are assigned in the high scenario because existing permit limits for these pollutants are less stringent than the projected CTR-based limits. The rationale behind this assumption is the same as for silver (see above).

* Endrin is not listed as a pollutant of concern in the revised Economic Analysis. In the low scenario, reasonable potential is not assigned because, as Sunnyvale also indicated, the pollutant is consistently reported below detection levels. In the high scenario, no costs are assigned because the existing limit is as stringent as the projected CTR-based limit. Sunnyvale indicated that although endrin was detected in the effluent, the detection level is greater than the projected CTR-based effluent limit suggesting that controls may be necessary. However, since the existing permit limit is as stringent as the CTR-based projected limit, any compliance costs are attributable to the existing limit and not the CTR.

* In the revised Economic Analysis, pentachlorophenol is assigned compliance costs in the high scenario and not in the low scenario. This is because the existing permit limit is less stringent than the projected CTR-based limit and all available effluent data are below detection levels. As shown in the cost decision matrix presented in the Economic Analysis, EPA assumes that addition of treatment is not justified when effluent data are inconclusive or limited.

* No pollution control costs are estimated for chlorodibromomethane and dichlorobromomethane in the revised Economic Analysis. The existing NPDES permit does not include limits for these constituents. In addition, no recent effluent monitoring data (1995 to 1997) were available. Although, Sunnyvale indicated that it had completed reasonable potential analyses for chlorodibromomethane and dichlorobromomethane, it did not provide these analyses to EPA.

* Please see the response to CTR-021-004 for a detailed discussion of EPA's response to the issues the commenter raises regarding copper.

* In the revised Economic Analysis, the reduced risk level scenario for silver, endrin, pentachlorophenol, and 1,2-dichlorobenzene (Appendix II-B) is identical to the base scenario. Thus, the above responses are also applicable to the Appendix II-B comments Sunnyvale submitted.

Comment: Weaknesses in Cost Analysis

The report's cost estimates exhibit a number of significant weaknesses, as follows:

* No evidence is presented that the selected case studies reflect the overall population of affected parties. Although a stratified sample approach appears to reflect sound basis from which to estimate costs, USEPA provides no explanation as to how the case study areas were selected- no evidence that the impacted population is statistically "normal"(*6) and no informationindicating that the sample size is sufficient to make generalizations (e.g., 7 percent of the major POTW NPDES permittees; 1 percent of the minor NPDES permmittees). Likewise the analysis points to significant diversity in how Regional Water Quality Boards treat permits, with potentially concomitant cost implications. Excluding a few high-cost parties from the sample, and ignoring regional Board behavior, could falsely indicate that total Rule costs are less than $100 million a year.

An alternative sampling approach could focus on the presence and distribution of affected pollutants, rather than the impacted entities. Since costs to control metals and mercury are estimated to account for almost 60 percent of total annual costs,(*7) examination of the presence of these pollutants in different state regions could provide a basis for alternative cost estimates.(*8) Or, to account for different regional water quality conditions and Regional Board behavior, sampling could be done by water body.

(*6) In fact, the provided data implies that a handful of dischargers may be responsible for the great majority of costs.

(*7) This estimate in itself may be suspect, as organics may account for a larger proportion of the contaminants than indicated by USEPA.

(*8) This approach would require a great deal more information about existing pollutant characteristics and distribution. However, such knowledge would seem to be a critical precursor to rule development.

Comment: 5. Concerns Regarding Economic Analysis

The District also has several significant concerns with the Economic Analysis that was performed for the proposed rule. Concerns about the cost estimates made for both the District and the state are presented here. (See attached Review of EPA's Economic Analysis of the Proposed California Water Quality Toxics Rule.) Overall, the District believes that problems with the Economic Analysis are serious enough that is should be redone. As stated above in our analysis of assumed costs at the SRWTP, the use of questionable data without qualification combined with unsubstantiated assumptions regarding costs to achieve compliance resulted in a gross underestimate in the cost-effectiveness ratio. The District's first concern is that if the types of problems found in our Case Study are widespread in other studies, the complete analysis is suspect.

In addition to the analysis of the District's facilities, there are several other points which have been used by EPA to lead to a potentially serious understatement of actual costs. The key assumptions involved are that: 1) no costs would occur if either no monitoring data presently exists or if that data is below analytical detection levels; 2) no treatment costs would occur whenever EPA's initial estimates showed high costs, due to successful regulatory relief; 3) no costs are included for nonpoint sources such as municipal stormwater management systems; and 4) no costs are included for indirect dischargers to the District's system that are not large enough to be considered a Significant Industrial User (SIU).

Regarding the first assumption, the District has found that there is pressure from many sides, including the Safe Drinking Water Act, to both increase the number of constituents being monitored and to lower detection levels to meet numeric criteria set by EPA and the state. To assume that monitoring of these new constituents will not lead to any treatment cost increases is simply unrealistic. Similarly, the second assumption about absolute success in every pursuit of regulatory relief is also overly optimistic. There are no guarantees that pursuit of regulatory relief will be successful in any situation, and EPA indicates elsewhere in the preamble that options such as variances and site-specific criteria will rarely, if ever, be granted.

The third and fourth key assumptions ignore present dominating trends and facts, i.e. that. prevention and control of pollutants at their sources, including very small indirect dischargers, storm runoff, and other nonpoint sources are now the major focus of EPA's wastewater programs nationally. While we agree that these management steps should be taken, there will be significant costs attached to the implementation of these steps that cannot be ignored.

Combined with concerns the District has heard from other sources such as the California Association of Sanitation Agencies (CASA), it appears that EPA has failed to make "a reasoned determination that the benefits of the intended regulation justify its costs." Therefore the District believes that the Agency is obligated to redo the draft Economic Analysis.

Comment: 4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution;

(2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements;

(3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and

(4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule.

The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act.

Comment: EPA's Economic Analysis

Attachment 4 to this letter, are detailed comments by the City on EPA's Economic Analysis of the costs and benefits that are anticipated from adoption of the CTR. This attachment is also incorporated as part of our comments and is being submitted for inclusion in the record for this rulemaking.

Although the City initially supported a waiver of OMB review of the CTR, we are very concerned with the number of uncertainties and erroneous assumptions contained in the Economic Analysis. We are particularly concerned with EPA's interpretation of the San Jose/Santa Clara facility data as it relates to the cost and attainability of limits based on the proposed copper and nickel criteria. We are also extremely concerned with the use of this data to draw conclusions about costs and compliance with for other pollutants or other facilities. Finally, we are also concerned that the State may attempt to use or rely on the Economic Analysis in promulgating its implementation plan.

We understand the difficulty of performing such an analysis, but we also believe that the importance of a complete, thorough and supportable Economic Analysis cannot be overstated. As discussed in more detail in Attachment 4, the Economic Analysis does not fully account for all costs and the benefits, nor does the Analysis accurately calculate and analyze the costs and benefits that are presented. As indicated above, EPA's conclusions about costs and benefits cannot be validated at this time due to uncertainties about State implementation of the Rule.

Comment: C. RECOMMENDATIONS FOR MODIFICATIONS TO THE CTR AND EA

Revise the Economics Analysis. The EA should be revised to incorporate the updated and more representative cost data provided by POTWs. The benefits analysis should also be revised using the methodology recommended by M.Cubed and others. EPA should use data more representative of California, rather than relying on questionable data from a Ph.D. dissertation. The EA should also include sub-sections specific for San Francisco Bay and effluent dependent water bodies.

Response to: CTR-052-014

See response to CTR-021-008.

To update its analysis for the final CTR, and in response to comments, EPA collected the most recent publicly available data for all facilities included in the cost analysis, including permits, fact sheets, permit applications, and discharge monitoring data. Data submitted as a part of the public comments were also reviewed and considered.

Comment: Thank you for the opportunity to submit comments on the proposed California Toxics Rule (CTR). As we indicated in our oral comments at the September 18, 1997 public meeting, the City of Los Angeles is primarily concerned about the adequacy of your agency's cost/benefit analysis (particularly with respect to the Tillman Water Reclamation Plant case study). Although we highlight this issue in the following comments, we have a number of additional concerns regarding other important matters raised by the proposed Rule that are also presented. We strongly urge the EPA to consider these comments and

recommendations, especially with regard to revision of the economic analysis.

Overview of Affected Facilities

The City owns and operates three treatment facilities that would be impacted by the proposed Rule:

DC Tillman Water-Reclamation Plant. This 80-MGD facility is located in Van Nuys and provides tertiary-treated reclaimed water that is essential for current and planned reuse projects (irrigation, recreation and wildlife habitat) and aquatic wildlife support (via discharges to natural portions of the Los Angeles River). A major water reclamation project (East Valley Water Recycling Project), currently under construction, will deliver up to 30 MGD of flow to groundwater recharge basins and industrial users in the San Fernando Valley. The plant's service area comprises a population of approximately 1 million people.

Los Angeles-Glendale Water Reclamation Plant. This 20-MGD capacity plant (partly owned by the City of Glendale) supplies tertiary-treated reclaimed water for several industrial and irrigation uses, while discharges to the Los Angeles River support natural portions of the Los Angeles River. The plant's service area includes portions of the cities of Los Angeles and Glendale, comprising a total served population of approximately 250,000 people.

Terminal Island Treatment Plant. This 30-MGD facility, located in San Pedro was recently upgraded to tertiary capability via the addition of deep-bed effluent filters. This plant is the site of a major water reclamation project which will ultimately supply advanced-treated (microfiltration/reverse osmosis) effluent to nearby oil refineries and support industries. The plant serves a population of about 300,000 people.

The combined annual operation and maintenance cost of these facilities is approximately $15 million. As the City is also expanding its Hyperion Treatment Plant to full-secondary capability, the incurred costs of this and other capital-improvement efforts have severely restricted the City's ability to invest in additional projects without placing additional financial burdens on rate payers in the City. Consequently, the benefits (as well as the costs) of the CTR as identified in the EPA's economic analysis were examined closely.

Comments

While the CTR proposes criteria and provisions having a broad range of impacts to POTWS, we have identified a number of issues that we are primarily concerned with. These are discussed individually in the following statements.

Economic Analysis

In view of the substantial capital and O&M investment that the City's treatment facilities represent, our primary concern of course is the proposed Rule's Economic Analysis (EA) and the misleading impression it makes with respect to the Rule's probable cost. Overall, we believe that the CTR presents the EA as a conclusive statement of cost based on two model approaches, of which neither represents an accurate assessment of the true costs to POTWs. The first model provides what is essentially a "no cost" scenario, while the second approach results in a high-end amortized cost of only $86.6 million per year State-wide. This number (rounded to $100 million) and the methods utilized in its derivation is highly suspect as a basis for the Office of Management and Budget's declaration that the Rule will not significantly impact State dischargers. The figure was based for the most part on the EPA's investigations of several case

studies in which detailed cost analyses were conducted for POTWs deemed to be "problematic;" that is, treatment facilities whose performance histories indicated the possibility that the proposed Rule would have significant cost impacts.

These case studies included our Tillman facility, which since 1991 has undergone a uniquely painful experience with respect to NPDES compliance as a direct result of priority-pollutant rule promulgation. As you are likely aware, the plant's NPDES permit was renewed in September 1991 shortly after the State's adoption of the Inland Surface Waters Plan (ISWP), which itself imposed priority-pollutant criteria identical with or similar to those included in the proposed Rule. To our knowledge, our plant was the only one in the region that suffered the fate of having to comply with a water quality control plan that was subsequently invalidated by the State Superior Court.

Following the ISWP's April 1991 adoption and renewal of the NPDES permit, our plant immediately experienced compliance difficulties with respect to chronic toxicity, copper, lindane, DDT, methylene chloride, and numerous other trace organic compounds. In April 1992, we completed a 6-month study investigating the probable cost of ISWP compliance for the Tillman facility. In view of the staggeringly high costs we identified (see following summary), we initiated ongoing and costly efforts to identify and implement industrial source controls; from this, we reduced methylene chloride down to compliance levels but we determined that many of the problem constituents are not source-controllable. Consequently, in 1993 we initiated a process with the Los Angeles Regional Water Quality Control Board to obtain relief in the form of a modification of the NPDES permit. Since that time, and even in view of the 1995 invalidation of the ISWP, we have been unsuccessful in negotiating what we feel are justified revisions to the NPDES permit.

EPA's cost estimates in the Tillman EA take none of this into account. The EPA instead treats the plant's NPDES as a compliance baseline from which comparisons with the CTR are made. As a result, it was a foregone conclusion that the EPA would not find any significant cost impacts to the plant due to the proposed Rule, as the Rule's criteria are already effectively contained in the plant's NPDES permit! Our 1992 cost estimates (see attached summary sheets) translate into an annual amortization and O&M cost of approximately $36 million. An updated estimate ($40 million) conducted on the basis of the proposed Rule confirms the magnitude of these costs.

When we described this situation at the September 18 public meeting, we were advised by the national EPA representative to seek variances for problem constituents. While these variances can alleviate Tillman's non-compliance issue, this approach does not address the compliance cost underestimation issue. In view of this, we believe that the EA is fundamentally flawed from the Tillman plant's perspective and therefore in need of substantial revision. Furthermore, this is not a moot point given the fact that the State intends to adopt a revised version of the ISWP, as it is our belief that EPA recognition of the probable true costs of CTR compliance would have a major effect on ISWP implementation provisions. We believe that a more objective assessment of the CTR's cost impact would also provide a more realistic evaluation of the Rule's environmental benefits, which by comparison appear to be overestimated in the EA.

The City therefore respectfully requests the EPA to revise the economic assessment and to amend the Tillman EA to reflect the true cost of compliance. Given the somewhat unfortunate timing of the proposed Rule with the State's own Draft Implementation Policy (which we have only begun to analyze), we further request that the EPA consider working in collaboration with the State and the public members of the State's Economic Considerations Task Force to develop mutually agreed-upon approaches needed to revise the EA.

Miscellaneous comments:

* The EA refers to a 10-year amortization schedule (Pages 4-2 and 9-3), but Exhibit 9-2 (the cost benefit comparison) refers to equipment purchases at 1 and 16 years (a 15-year amortization schedule).

* The statements in the last row of Exhibit 8-21 casts considerable doubt on the overall adequacy of the EA with respect to benefits.

* The EA avoids the issue of cross-media pollutant transfer and the associated costs. Spent activated carbon and reverse-osmosis brine are wastes representing real disposal problems.

Comment: EPA's estimate of cost-effectiveness ($8 - $12 per toxic pound equivalent) is considerably lower than the estimates prepared by others. The Bay Area Dischargers Association and the Novato Sanitary District calculated unit costs for copper removal to be in excess of several thousand dollars per toxic pound equivalent removed.

Response to: CTR-040-039

In response to comments received by EPA on the economic analysis that accompanied the proposed CTR, EPA collected additional data for the sample facilities. EPA also revised its estimate of potential compliance costs attributable to the CTR.

EPA's low estimate of total annualized costs of the final CTR is $33.5 million per year and its high estimate is $61.0 million per year. The low and high estimates vary based on whether effluent data or permit limits are used to assess the need for additional controls. They also vary based on whether or not alternative regulatory approaches, such as phased total maximum daily loads/water quality assessments, site-specific criteria modifications, standards variances, metals translators, etc., are considered under certain circumstances. EPA believes that its estimates of costs and benefits are sound.

EPA believes that several general observations can be made regarding studies submitted by commenters and how they differ from the EPA cost study for the final CTR. Many commenters assumed that the mere presence of a pollutant would result in costs to comply with a CTR-based WQBEL. It should be noted that the presence of a pollutant in an ambient inland water, enclosed bay, or estuary does not require permitting authorities to establish a WQBEL for that pollutant. The establishment of a permit limit is appropriate only where the permitting authority determines that a pollutant is likely to be present, and that the pollutant concentration has a "reasonable potential" to cause or contribute to an exceedance of the applicable water quality standard. Where the pollutant is not likely to be present, or is not present at levels that have reasonable potential to cause or contribute to a water quality standard exceedance, a WQBEL may not be necessary.

The majority of cost estimates provided by commenters include the costs for the addition of end-of-pipe treatment to achieve proposed CTR-based WQBELs. This was particularly the case when WQBELs were expected to be below analytical detection levels. EPA disagrees that end-of-pipe treatment is necessary to achieve CTR-based WQBELs in all cases. As discussed in SAIC (1995), there are documented cases where waste minimization or source control techniques have been used to comply with existing permit limits established below detection levels. Other examples include the Western Lake Superior Sanitary District (WLSSD), who after evaluating the costs involved to meet more stringent WQBELs for mercury

with end-of-pipe treatment, concluded that pollution prevention techniques were the preferable control strategy. As a result, WLSSD published a guide designed to "assist wastewater treatment plant staff with creating and implementing their own mercury reduction projects." As a result of the efforts of WLSSD, effluent mercury levels were found to decrease from 0.58 parts per billion (ppb) to 0.015 ppb.

Although waste minimization or source controls are not always applicable, EPA assumes in its low estimate of costs that a facility would first evaluate whether process changes or modifications are feasible, prior to incurring costs for adding treatment.

In addition, many commenters assumed that compliance would be based on the WQBEL, regardless of whether it is below the analytical method detection level (MDL). This is not consistent with current practice. Instead, the State may use the "minimum level" (ML) (as defined in 40 CFR Part 136) as the required compliance point where a permit limit is established at a value below the MDL. The ML is a value at which the limited parameter can be accurately quantified, and is always greater than or equal to the MDL. To ensure that its cost estimates were conservative (i.e., erring on the side of higher costs), EPA used the MDL as the compliance level. Although EPA used the pollutant MDL for costing purposes, the Agency acknowledges that estimating treatment costs for WQBELs below the MDL is speculative and likely unrealistic.

Finally, many of the commenters included costs related to installation of treatment for storm water discharges. As further described in the responses to CTR-021-008 and CTR-040-004, EPA believes that the final CTR will not significant affect the current storm water program being implemented by the State, which includes the requirement to develop best management practices to control pollutants in storm water discharges. As such, EPA believes that inclusion of end-of-pipe treatment costs for storm water are inappropriate.

Comment: The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule (see Attachment 3). The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. BADA's analysis shows that its member agencies alone could be faced with costs in excess of $100 million per year to achieve effluent limits based on the copper, PAH, heptachlor and aldrin criteria. BADA's analysis also indicates that the benefits associated with this

expenditure will be difficult to measure. Copper loadings will be reduced by 1% and the level of compliance for PAH's and heptachlor will remain unchanged at its present high level. Certainly these benefits will not measurably improve the fishing experience or measure the number of fisherman in the Bay, significantly reduce the cancer cases, or improve property values or other nonuse benefits, as estimated in EPA's economic analysis. A further consequence of the flawed economic analysis is the conclusion that the CTR is not a major rule (i.e., one which will result in excess of $100 million per year expenditure) subject to Presidential Executive order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Reform Act. BADA agencies provide service to a number of small communities with populations under 50,000 people that could be greatly impacted by the proposed rule.

Response to: CTR-054-013a

EPA believes that the sample of dischargers selected adequately represents the various types of direct dischargers in the state. EPA would have considered any and all information submitted by a discharger that did not think it was adequately represented by the sample facilities.

See responses to CTr-021-008, CTR-059-018, CTR-040-029a, CTR-032-004, CTR-056-018, and CTR-021-005c.

The commenter is referring to the estimate of total potential benefits in the analysis of benefits document. In EPA's EA for the proposed (and final) rule, only the portion of benefits expected to be achieved by implementing controls on point source dischargers are counted. EPA recognizes that the proposed standards will not be achieved in some cases by controlling point sources alone. EPA's assumptions regarding the attribution of benefits to the rule are described in the EA for the proposed rule in Chapter 7.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

EPA believes that controls on point source dischargers will, in many cases, contribute to attaining standards in a given water body. As controls on other sources are also implemented, the water quality standards can be achieved. However, the total maximum daily load (TMDL) process is provided to address cost-ineffectiveness as it pertains to point or nonpoint sources. For example, if controls on nonpoint sources are a more cost-effective approach to achieving standards, the State can redistribute the load allocations through the TMDL process.

EPA did not include values for water- and land-related benefits other than fishing, but noted that potential benefits may be underestimated because these benefit categories are not included. As described in the EA (See Chapter 8), EPA believes that these benefits may be appreciable because such recreational activities (e.g., boating, swimming, picnicking, and related activities) have been shown in empirical research to be highly valued, and even modest changes in participation or user values could lead to sizable benefits statewide. Some of these activities can be closely associated with water quality attributes (e.g., swimming) and others might increase due to their association with fishing, swimming, or other activities in which the participants might engage.

Comment: The CTR Analysis Incorrectly Evaluates Permit Compliance By Using an Average Monthly Effluent Limit Rather than the California Regional Board's Maximum Effluent Limit

The EPA analysis assumes that the limit to be achieved, either 4.9 or the potential CTR limit of 5.55 ug/L is a monthly average limit. The current state NPDES permit cites the limit as a 1-day average limit, based on the San Francisco Basin Plan's 1-hour marine water quality objective.

Sunnyvale's 1994-1996 weekly effluent copper data (155 data points) had a mean of 4.3 ug/L, but a maximum of 9 ug/L, a 99%tile of 8.9 ug/L and a 95%tile of 7.0 ug/L.

The CTR economic analysis (Appendix Table I-B-3) calculated average monthly limits (AML) of 5.5 ug/L and maximum daily limits (MDL) of 9.27 ug/L for copper. EPA needs to specify if the State is currently in error in its interpretation and implementation of effluent limits in this manner. Furthermore, the CTR should clarify if this means that it is acceptable for States to calculate and include monthly average (30-day) limits in NPDES permits based on the proposed CCC criteria and the TSD based methodology used in the economic analysis (and similarly daily average limits based on the proposed CMC criteria).

Based on current State permits the economic analysis must be corrected since the threshold for determining whether or not additional measures would be required to comply with the CTR is based on a comparison with average, not maximum values. As noted above, unless EPA is redefining the chronic averaging period as monthly instead of 4-day (or 1-day), Sunnyvale can not achieve a 4.9 or 5.5 ug/L copper effluent limit (WPCP effluent is above this limit approximately 30-40% of the time). Other dischargers to San Francisco Bay that aren't allowed dilution credit face the same compliance problem and will require additional treatment to meet a 1 or 4-day limit in that range. Therefore, extrapolation of the CTR analysis to other dischargers is not appropriate an d will lead to erroneous results and misleading conclusions.

Response to: CTR-021-010

This comment refers to Sunnyvale's previous one-day average copper limit. The previous permit limit was based on the underlying national criteria (saltwater) in effect at that time [2.9 ug/L for both the chronic aquatic life (CCC) and acute aquatic life (CMC)]. The State was not in error in implementing the above criteria as a one-day average limit. In the CTR, the saltwater copper CMC has been revised to 4.8 ug/L dissolved and the CCC has been revised to 3.1 ug/L dissolved. The revised CCC should not be implemented directly as a one-day average. EPA recommends that the State calculate both average

monthly limits and maximum daily limits based on the chronic and acute criteria using the U.S. EPA Technical Support Document (TSD) approach (1991). Therefore, EPA used the TSD approach in the Economic Analysis to estimate facility compliance with CTR-based WQBELs.

Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that if a discharger has no effluent data that the discharger will not incur costs as a result of the CTR.

Response to: CTR-040-027

If a discharger had no effluent data, EPA did not automatically assume that the discharger would have no costs as a result of the CTR. When effluent data was available, however, EPA used the method in EPA's Technical Support Document for Water Quality-based Toxics Control (1991) to determine reasonable potential and then followed the methodology (i.e., the cost-decision matrix) described in the Economic Analysis (EA) of the final CTR to estimate costs. In the abscence of data under the high scenario, reasonable potential was assumed if the discharger had an existing permit limit for a pollutant and EPA then estimated costs using the methodology described in the EA. See also response to CTR-003-011.

Comment: Pursuant to our conversations following the California Toxics Rule (CTR) hearing of 17 September, find enclosed 1994, 1995, and 1996 data from priority pollutant monitoring at the City of Merced Wastewater Treatment Facility. It is our understanding that the information will be utilized to refine the economic impact analysis from the City of Merced Case Study.

One qualification we submit regarding the enclosed data is that cyanide, dutifully reported as having been detected in POTW effluent in 1994 and 1995, was likely not actually present. It has been demonstrated that nitrogen interference during cyanide analysis of chlorinated samples will often result in falsely positive results. To prevent this, EPA has approved a sulfamic acid scrubbing procedure to counter the interference. That procedure was not practiced by our analyzing laboratories until 1996. No contributor of cyanide has been identified in Merced, and, it has never been detected either at the influent or primary effluent of our plant. The sulfamic acid scrubbing procedure was incorporated in the analytical procedures during 1996, and there have been no detections of cyanide in POTW effluent since.

If there are any questions please do not hesitate to contact me at (209) 385-8693.

Response to: CTR-093-001

EPA has removed cyanide from its economic analysis for the final CTR because EPA's analysis of existing data and facility information resulted in no determinations of reasonable potential for cyanide.

Comment: Appendix Ill-B states that "The existing permit limits and/or the maximum reported concentrations of copper, nickel, silver, endrin, 1,2-cichlorobenzene, chlorobenzene, chlorodichloromethane, and toluene are less stringent than the projected CTR-based limits".

* Copper: A reasonable potential analysis of plant performance data indicates that there is a reasonable potential under these grossly conservative and misleading assumptions to exceed both the CTR based maximum daily limit and the average monthly limit.

* Nickel, silver, and zinc: A reasonable potential analysis of plant performance data indicates that under these grossly conservative and misleading assumptions there is no reasonable potential to exceed the CTR based maximum daily limit. However, if the projected maximum concentrations are compared to the CTR based average monthly limit, there is a reasonable potential for the effluent concentrations to exceed these limits.

* Organic compounds: See notes for Appendix I-B above.

Response to: CTR-021-016

EPA revised its EA including the use of more recent data. In the revised EA, nickel, silver, and zinc have reasonable potential in the high-end scenario because the facility has existing permit limits, however no load reductions are estimated for these pollutants in either the low- or high-end scenarios.

Comment: * In general, we are pleased that EPA prepared an analysis of the economic impacts of the proposed CTR, and that a major portion of EPA's work focused on determining the potential impacts on POTWs. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Detailed comments can be found in Attachment 2. A few of the areas of concern are listed below:

* Small facilities appear to be under represented in EPA's sample of POTWS, especially for minor dischargers.

* The cost triggers used as regulatory relief thresholds are unrealistic, and are not consistent with EPA regulations and policies.

* The assumptions used to determine cost estimates for indirect dischargers appear to omit a large proportion of potentially affected industries.

* The Economic Analysis does not take into account projected population and industrial growth over time, which may influence effluent quality and quantity. Statewide, the population is projected to grow by nearly 50% by 2020.

* The use of average cost estimates masks economic impacts on individual dischargers, which may be particularly acute for small communities.

* The economic Analysis ignores the costs that may be incurred by stormwater dischargers and nonpoint sources to reduce loadings so that CTR criteria may be met in ambient waters.

Comment: Finally, we have serious concerns about the accuracy of the draft Economic Analysis and the estimates of the costs and benefits of the draft CTR (see detailed comments in Attachments I and 2). Our primary concerns related to the cost analysis include 1) that the case studies on which the cost analysis is based do not adequately represent the actual population of POTWs in California; 2) the omission of costs that could be incurred by many sectors that contribute to overall loadings, and, hence, can be expected to have to reduce their loadings (e.g., non-SIU indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources of CTR-regulated pollutants); 3) the use of numerous assumptions that underestimate costs; and 4) the capricious removal of costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the lack of any proposed regulatory relief trigger in the proposed regulation.

To illustrate the degree of underestimation of costs for the POTW sector alone, we looked at potential compliance costs for the POTW sector. We found that the potential costs for 23 major POTWS. on an annualized basis, may reach $400 million. We believe that this analysis demonstrates that the potential cost consequences of compliance with effluent limits based on the proposed CTR criteria would easily exceed the $ 100 million annual cost threshold, especially when the costs of all 313 POTWs in the State are estimated. Thus, we believe that EPA must conclude that the proposed CTR could have significant economic impacts on local governments.

Comment: pp. 2-4 - 2-9 (U.S. EPA, 1997b) -- Sampling Strategy In general terms, we support EPA's methodology of stratified sampling to determine costs, although it is not clear whether the POTW sample was stratified appropriately. We believe that inadequate evidence is presented that the sample of case studies reflects the overall population of POTWs, and that extrapolation based on the sample would truly reflect total POTW costs. Little explanation is provided as to how the case study facilities were selected, and little evidence is presented demonstrating the validity of extrapolating from the small sample to the impacted population of POTWs. In particular, we believe that minor facilities were under-represented, and that it is invalid to assure that none of the 185 minor POTWs will incur any costs. We also believe that larger samples of facilities from 0-10 MGD and from 10-100 MGD also would be necessary to obtain valid estimates of POTW costs. In addition, by assuming that existing facilities that contain effluent limits for toxic pollutants were representative facilities and using them as the basis for extrapolation to the universe of potentially affected facilities, EPA may have failed to include a major category of costs. By ignoring the costs of those facilities meeting their current permit limits, EPA is assuming that the facilities they are extrapolating to have similar current permit limits, which was not demonstrated to be the case. Therefore, EPA should reexamine the use of this assumption in the analysis of POTW costs.

Response to: CTR-035-046a

EPA believes that the sample facilities adequately represent the universe of facilities in California. Facilities within the sample demonstrate both compliance and non-compliance with projected CTR limits and, although the sample may not exactly represent the actual proportion of facilities not in compliance with limits, EPA believes that the overall economic analysis uses conservative cost estimation techniques which actually overstate costs. See also response to CTR-059-018.

Comment: Weaknesses in Cost Analysis The report's cost estimates exhibit a number of significant weaknesses, as follows:

* Potential impacts on non-point sources merit greater attention than given them in the Analysis. Since non-point sources (e.g., mining/mine tailings; agricultural drainage/runoff; urban runoff/stormwater) are responsible for the great majority of potentially harmful discharges, they will almost certainly be affected by the proposed Rule. Likewise, these sources must be addressed if the benefits estimated by USEPA are to be obtained. Greater examination of these costs would be no more speculative than many of the benefit estimates shown in the report.

Comment: 4. The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. The District's analysis demonstrates that actual costs may be an order of magnitude greater than EPA's $500/lb threshold and that the benefits are very small.

Comment: EPA erroneously assumes that minor POTW dischargers (i.e., those with a permitted flow of less than 1.0 mgd) will not incur significant impacts as a result of the CTR.

Response to: CTR-040-024

For analysis of the final CTR, EPA updated its Economic Analysis to reflect the most recent data and information for each sample facility and also increased the sample size for minor facilities. Based on this revised analysis, EPA estimated that minor POTWs will incur costs of approximately $5,000 per facility per year under the low cost scenario and $7,800 per facility per year under the high cost scenario. Comment: We have reviewed the proposed CTR and offer the following comments:

4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an

additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. Additional concerns with the economic analysis are presented in Exhibit F. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act. The City, for example, is a small community having a population of under 50,000 and would be greatly impacted by the proposed rule.

Comment: The draft Economic Analysis has serious flaws. It underestimates the costs of the draft CTR and overestimates the benefits. For the cost analysis, EPA should reevaluate the representativeness of the sample used; the omission of impacts on many sectors that contribute to loadings, and hence, can be expected to have to reduce their loadings (e.g., small indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources); the incorporation of numerous assumptions that underestimate costs; and the assumption to artificially remove costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the fact that they are not automatically granted through triggers included as part of the proposed regulation.

Comment: With respect to other criteria proposed for adoption in the draft CTR, we recommend that USEPA:

4. Review and correct existing flaws in the current "Economic Analysis."

With respect to the Economic Analysis conducted by USEPA, we are concerned that it underestimates the cost of the proposed CTR rule while overestimating its benefits. We suggest that USEPA re-evaluate (1) the representativeness of the sample used; (2) the omission of impacts on many sectors that contribute to loadings; (3) the incorporation of a variety of assumptions that underestimate costs; and (4) the assumption to artificially remove costs that exceed threshold values by incorrectly assuming that regulatory relief measures will be granted. For the benefits analysis, USEPA should utilize more California-specific and recent information. A further problem with the analysis relates to the establishment of criteria that are below analytical detection. Lacking credible data, it was not possible to conduct cost-benefit analyses or determine that any set of control measures would or could lead to compliance. This fundamental inability to utilize established rulemaking procedures requires, in our opinion, further work prior to the promulgation of the criteria.

Comment: Economic Analysis

The Sanitation districts commends EPA for preparing an analysis of the economic impacts of the proposed CTR, and for selecting POTWs for half of the case studies. We believe that EPA is correct in thinking that POTWs are likely to experience major impacts as a result of the promulgation of the CTR. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Our own attainability and cost analysis indicates that there are indeed fundamental flaws in the cost analysis. A few of the areas of concern are listed below:

* Small facilities appear to be under-represented in EPA's sample of POTWs, especially for minor dischargers.

Response to: CTR-059-018

EPA acknowledges that evaluating the impact of each individual direct discharger to inland waters, enclosed bays, and estuaries within the State of California would be the most accurate method to determine impacts of the CTR. However, the resources that would be required to perform such an analysis for each of the over 1,241 direct dischargers are beyond the resources typically available for

development of environmental regulations. EPA would have considered well-documented information submitted in comments.

In developing the methodology for estimating the compliance costs for the proposed CTR, time and budget constraints limited EPA's costing review to a subset of the regulated community. However, EPA believes that the sample selected adequately represents the various types of direct dischargers in the State.

EPA acknowledges that minor dischargers were under sampled as compared to the major dischargers. However, by definition, under the NPDES permit program, facilities classified as minor would not be expected to discharge toxic pollutants in toxic amounts. Since the CTR addresses only toxic pollutants, EPA would not expect significant, if any, impact to minor dischargers.

In analyses of the final CTR, EPA increased the sample of minors by five randomly selected facilities to bolster its analysis. EPA estimated costs of $872 per minor facility under the low scenario, and $2,682 per minor facility under the high scenario due to the CTR.

EPA also replaced Silvergate with South Bay in the sample in order to improve the estimate of the impacts of the CTR on the electric utility industry. The draft CTR cost analysis included costs for Silvergate, but the facility had closed and the data available were over five years old. The addition of South Bay, an electric utility facility with no costs, to the sample results in a more realistic, lower overall cost estimate for the electric utility industry.

Comment: PROVISIONS SDG&E DOES NOT SUPPORT

As described in the following comments SDG&E does not support the following provisions:

Economic Analysis is deficient

EPA's economic analysis evaluated a number of discharger categories to estimate the potential costs associated with the adoption of these criteria. One discharger category was electric utilities which evaluated the costs to power plants. EPA's analysis of the electric utility category was deficient for at least two reasons. First, the analysis included two relatively small power plants. Specifically, the assessment included Pacific Gas & Electric's Hunter Point Power Plant (HPPP) and SDG&E's Silver Gate Power Plant (SGPP). Both the HPPP and SGPP are relatively small plants (generating capacities are approximately 396 MW and 230 MW, respectively). The SGPP is no longer in operation and its NPDES permit was rescinded in 1995. In fact, the economic analysis did not evaluate costs to the SGPP because it had not operated for several years. Both PG&E and SDG&E have plants affected by this rule which are larger (e.g., Pittsburgh at 2,060 MW and South Bay Power Plant at 709 MW). Consequently, the cost estimates for the entire category were based on only one small facility representing one water body and are therefore not likely to be representative of the actual costs that will be incurred by electric utilities.

Comment: The areas with which we find concerns and the requested changes include the following:

* The draft Economic Analysis has, from our short review, some serious flaws. It underestimates the costs of the draft to implement the CTR and overestimates the benefits. For the cost analysis, EPA should re-evaluate the representativeness of the sample used; the omission of impacts on many sectors that contribute to loadings and, therefore, can be expected to have to reduce their loadings (e.g., small indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources); the incorporation of numerous assumptions that underestimate costs; and your assumption that artificially removes costs that exceed threshold values be assuming that regulatory relief measures will be granted, despite the fact that they are not automatically granted through triggers included as part of the proposed regulation.

B Comment Period

Comment: The subject rule has a significant impact on our facility discharge and the citizens of the City. We therefore present the following comments for your consideration to re-open the comment period for this rule in order to facilitate a more complete review by public and in particular by those in the POTW community:

* The draft economic analysis seems to have serious flaws. It under-estimates the cost of the draft CTR and overstates the benefits. In the cost analysis USEPA should re-evaluate the representativeness of samples used and the omission of impacts on many factors that contribute to loadings, and hence, can be expected to have to reduce their loadings (e.g., small indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources); the incorporation of numerous assumptions that underestimate costs, and the assumption to artificially remove costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the fact that they are not automatically granted through triggers included as part of the proposed regulation.

Comment: The District supports the following positions of CASA and SCAP where changes need to be made in the proposed California Toxics Rule:

* The District agrees with CASA and SCAP that the economic analysis has serious flaws. It underestimates the costs of the draft California Toxics Rule and overestimates the benefits. For the cost analysis, the EPA should evaluate the representativeness of the sample used; the omission of impacts on many sectors that contribute to loadings and hence, can be expected to reduce their loadings (i.e., small indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities and other non-point sources); the incorporation of numerous assumptions that under estimates the costs; and the assumption to artificially remove costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the fact that they are not automatically granted through triggers included as part of the proposed regulation.

Comment: There are some things that we do have some concerns with, and that is the uncertainties and assumptions made in the economic analysis.

Although the City strongly believes that California needs certainty in its water quality program process as well as implementation, we are concerned about the potential precedents being set by some uncertainties and assumptions in the federal economic analysis of cost and benefits.

Although the City supported the OMB waiver in order to expedite the standards program promulgation process in California, we are very concerned with what may be potential faults in the federal analysis that

could be carried over to the state planning process.

There are differences between the federal and state acceptance processes. Where the state process requires a much more in-depth analysis of cost incurred by any state water quality planning process, the City believes greater attention should be placed upon nonpoint source control program costs, potential costs that could be incurred to meet criteria now set below detectability, as well as any hidden costs that may be associated with some of the uncertainties and assumptions in the federal financial analysis.

Again, the City will provide much greater detail in its written comments by the end of next week. We thank you for the opportunity to comment and look forward to working with you in the future.

Thank you.

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and with an expectation that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit and with the same expectation, Sunnyvale would like to make the following points on its own behalf:

1. The Inadequacies of the EA. Sunnyvale is gravely concerned that the EA has significantly missed the mark in assessing Sunnyvale's potential costs to comply with the criteria in the CTR. As pointed out in greater detail in the EOA Letter, the methodology used in the EA is fraught with analytical errors and unfounded assumptions, leading to many unanswered questions regarding the costs which Sunnyvale may face in coming into compliance with CTR-based effluent limitations. Accordingly, Sunnyvale urges EPA in the strongest terms not to use Sunnyvale as a representative facility to extrapolate cost information to the remainder of California until the EA is re-done. Use of the EA analysis at this point will result in erroneous, unfounded and misleading results which would be a disservice to EPA's ethical and legal obligations.

We are particularly concerned about the EA's unsupported assumption that Sunnyvale can easily close the gap between current discharge levels for copper and the CTR level for that metal merely by more stringent application of source controls. Sunnyvale already has one of the most stringent source control programs in the U.S., developed after years of careful analysis and in cooperation with the Regional Water Quality Control Board and representatives of a vigorous and concerned environmental community. The available effluent improvements from this avenue have long ago been achieved. The misplaced assumption in the EA tends to grossly and arbitrarily understate costs associated with compliance, particularly the potential for requiring reverse osmosis as the only availablemeans of achieving concentration levels seemingly mandated by the proposed CTR.

Further, we strongly urge EPA to make clear that the overall methodology and approach used in the EA is neither appropriate nor legally sufficient for use by the State of California in promulgating its implementation plan or in promulgating State criteria for the pollutants addressed in the CTR. The gross inadequacies in the EA, which are depicted in the CASA/Tri-TAC letter, could not withstand judicial scrutiny under California's Porter-Cologne Act.

Response to: CTR-021-004

The City of Sunnyvale states that its present source control program is one of the most stringent in the country and that reverse osmosis would be required for compliance with a CTR-based effluent limit for

copper. EPA's revised cost analysis for Sunnyvale indicates that the facility is in compliance with the CTR-based effluent limit for copper and that the addition of reverse osmosis is not justified. As indicated in the Technical Support Document for the Economic Analysis of the Final CTR, the City of Sunnyvale reported one discharge observation for copper between January 1995 and December 1997 above the projected effluent limit for copper (8.03 ug/L). This single exceedance was 8.4 ug/L which is only 4% above the CTR-based permit limit. EPA believes that this violation frequency and the magnitude of the violation do not justify addition of reverse osmosis. Moreover, the projected pollutant loading reduction would likely have minimum pollution control costs. These costs would be associated with controlling discharges of copper using pollution prevention, or by optimizing existing processes (e.g., individual units performance under peak flows or critical conditions) at the POTW.

Note that EPA calculated the projected effluent limit for the City of Sunnyvale using a metal translator factor of 2.6 and a saltwater dissolved criterion of 3.1 ug/L. Additionally, the projected limit used was adjusted using statistical methods to account for effluent variability and different averaging periods. The resulting effluent limit is comparable to the copper limit established in the 1998 NPDES permit issued to the facility (8.6 ug/L).

The State is not required to use the EPA's Economic Analysis (EA) in promulgating its proposed implementation plan. While EPA and the State have worked very closely to gather the data necessary to develop their respective economic analyses, the State's economic analysis for its proposed implementation plan is different than EPA's. The State tailored the information gathered and reported in the EPA's EA to reflect the specific proposed policies in the State plan.

Although EPA disagrees with commenters that claim that EPA's EA is inappropriate for use by the State, EPA does believe that the State is under no obligation to use EPA's EA and may choose alternative methodologies for its economic analysis in support of State water quality policy or regulation.

Comment: pp. 2-4 - 2-9 (U.S. EPA, 1997b) -- Sampling Strategy In general terms, we support EPA's methodology of stratified sampling to determine costs, although it is not clear whether the POTW sample was stratified appropriately. We believe that inadequate evidence is presented that the sample of case studies reflects the overall population of POTWs, and that extrapolation based on the sample would truly reflect total POTW costs. Little explanation is provided as to how the case study facilities were selected, and little evidence is presented demonstrating the validity of extrapolating from the small sample to the impacted population of POTWs. In particular, we believe that minor facilities were under-represented, and that it is invalid to assure that none of the 185 minor POTWs will incur any costs. We also believe

that larger samples of facilities from 0-10 MGD and from 10-100 MGD also would be necessary to obtain valid estimates of POTW costs. In addition, by assuming that existing facilities that contain effluent limits for toxic pollutants were representative facilities and using them as the basis for extrapolation to the universe of potentially affected facilities, EPA may have failed to include a major category of costs. By ignoring the costs of those facilities meeting their current permit limits, EPA is assuming that the facilities they are extrapolating to have similar current permit limits, which was not demonstrated to be the case. Therefore, EPA should reexamine the use of this assumption in the analysis of POTW costs.

Comment: pp. 2-36 - 2-37 (U.S. EPA, 1997b) -- Use of Average Cost Estimates for Extrapolation EPA's use of average costs to estimate individual POTW costs masks a significant range in expenditures, indicating that some communities will be much more significantly impacted than others. By using averages for extrapolation rather than the full range, total cost estimates are likely to be severely underestimated.

Response to: CTR-035-048

EPA selected sample facilities in order to represent different industry categories, but also various facility sizes with different flow magnitudes. For example, EPA analyzed POTW facilities which fell into three flow categories representing facilities serving very large, medium, and small communities. Costs were averaged for the sample facilities within each flow category for an industry type and then extrapolated to the universe of facilities which matched the industry type and the range in flow for that flow category. Thus, costs calculated for facilities operating in very large communities would not be applied to facilities serving very small communities. See also response to CTR-059-018.

Subject Matter Code: E-01g10 Toxic Pound Equivalents

Comment: Cost per Toxic Pound Removed

Removal of copper by pollution prevention methods would be marginally cost effective. Pollution prevention of 10% of the Authority's annual copper load would result in a removal of 262 pounds per year from the Bay. Using the toxic weight factor from the EA, 0.47 results in a removal of 123 toxic pounds. Using the annual cost of $56,952 from the Larry Walker analysis results in a removal cost of $462 per pound. This approaches the high end of $500 per pound cited by EPA.

Removal of organics would not be cost effective. No toxic weights are listed for the PAHS, so this analysis is only for Heptachlor, which has a toxic weight of 4,100. Assuming that carbon adsorption removes 95% of the Heptachlor, and using the maximum recorded value of 0.018 ug/L results in the following:

(0.95)(0.018 ug/L)(4,100)(65 MGD)(365 days/year)(8.34 lbs/gal)(1 mg/l000 ug)=

13,872 toxic pounds per year

Using the annualized cost for carbon adsorption of $44,200,000 per year results in a removal cost of $3,186 per toxic pound. This figure is 6-16 times the threshold cost range cited by EPA of $200-$500 per toxic pound. In actual practice, the costs would even be higher since much of the data is non-detect with MDLs as low as 0.007 ug/L.

Comment: 11) What justification does the EPA have for assuming that, "If all monitoring data reported for a facility were reported as below analytical detection levels, even if the reported detection limit was above EPA approved analytical method detection levels, it was assumed that no reasonable potential existed to exceed CTR-based WQBELs".? Can permit holders make the same assumption to assess reasonable potential when applying for new permits?

Response to: CTR-003-011

The NPDES permit regulations in 40 CFR 122.44(d) and 123.25 require that WQBELs be derived for toxic pollutants that are discharged at a level that has a reasonable potential to exceed water quality standards. EPA believes that the approach used to determine reasonable potential to exceed CTR-based effluent limitations in its economic analysis was reasonable. This is particularly the case for the high cost scenario. Under this scenario, when any pollutant for which a limit for a toxic pollutant already existed in the current NPDES permit for a sample facility, it was assumed that a reasonable potential existed to exceed a CTR-based limit and the pollutant was included for further analysis. For pollutants that were not limited in the existing permit for a sample facility, but were detected in the effluent (as reported in the permit application, or as a result of special monitoring conditions contained in the NPDES permit), an analysis was conducted to determine if a reasonable potential existed to exceed CTR-based limits using the method recommended in EPA's Technical Support Document for Water Quality-based Toxics Control (1991). If all monitoring data reported for a facility were reported as below analytical detection levels, even if the reported detection limit was above EPA-approved analytical method detection levels, EPA assumed that no reasonable potential existed to exceed CTR-based WQBELs. Although EPA acknowledged in its economic analysis that this assumption could underestimate the impact of implementing the CTR, it most likely reflects the actual procedures that would be used by the State Regional Water Quality Control Boards (RWQCBs) because the discharger would not be subject to enforcement at any level below quantifiable analytical detection levels.

In estimating potential costs associated with the final rule, EPA also made an effort to ensure that all relevant and current information related to the possible presence of a pollutant in a sample facility discharge was collected. Specifically, all current information and data (including permits, fact sheets, permit applications, and other relevant discharge information) were updated and verified for each sample facility. In addition, each of the State RWQCBs were contacted to provide comments and additional information as necessary to ensure accurate reflection of current permit requirements and discharge conditions. Finally, permit and monitoring data submitted as a part of the public comments were reviewed and considered.

Comment: 13) The City has reviewed those sections of the economic impact report which dealt directly with it's treatment plant. Although we have not had the time to address directly the cost impacts, we can comment on the assumptions that were used. EPA finds that we may have problems meeting metals objectives and suggests that they can be solved by chemically assisted clarification and additional pollution prevention/ waste minimization controls. It should be noted that the City has used both of these techniques for many years. With minor exceptions for waste minimization, it is unlikely that further reductions can be attained by either method. Waste minimization is cited as the answer to potential problems with chloroform. EPA needs to be aware that chloroform is a byproduct of the wastewater treatment process where chlorine disinfection is involved. Waste minimization will not help. It would be more appropriate to assume that the disinfection process would need to change to ultra violet or a similar non-chlorinated method. Capital costs would likely range around three to four million dollars with operating costs near one million dollars per year.

Response to: CTR-003-013

See response to CTR-004-003.

EPA agrees that chloroform is most likely a disinfection by-product (DBP) in wastewater treatment plants that use chlorination as the means for disinfection and that UV is an alternative technology that eliminates the presence of chloroform in the effluent. However, it should be noted that process optimization in the chlorination units is a viable and relatively low-cost pollution control alternative that can be used to reduce the discharge of chloroform and other DBPs (Truax, 1992; U.S. EPA, 1992; U.S. EPA, 1990) to levels in compliance with projected CTR-based limits. Process optimization is used to control DBPs in the final economic analysis of the CTR.

Comment: The Estimated CTR Plant Optimization Compliance Costs for Sunnyvale are Under Estimated by One to Two Orders of Magnitude (10 to 100 times low)

The projected average cost per POTW under the high-end scenario of $480,000 per year (p. 4-12) is low by a factor of 10 to 100 based on Sunnyvale's situation and analysis (as cited in Appendix I-B-11). There is no support provided for the key assumption that "many of the sample facilities already possessed treatment processes that could be enhanced potentially to achieve CTR-based effluent limits" and "Therefore increased O&M was assumed adequate to comply with CTR-based effluent limits (as opposed to installing new treatment equipment). (p. 4-13).

Secondary treatment facilities with dual media filtration, such as Sunnyvale, are not specifically designed for metals or toxic organics removal. The removals that occur are an incidental function of the secondary biological treatment and solids separation processes. It is not technically possible to "dial-in" an additional 10-25% as has been assumed, particularly for facilities such a Sunnyvale, that already have low influent concentrations due to past implementation extensive source control, pollution prevention, and waste minimization measures. The presumption regarding plant optimization apparently mistakenly assumes that percent removal is a linear function instead of an asymptotic one. It is much more difficult to remove an additional 10-25% when the effluent contains only 5-10 ug/l versus say 20-50 ug/L when more of the copper is likely particulate (associated with solids) versus soluble and more amenable to removal through potential chemical addition to enhance solids removal.

Sunnyvale already achieves 85-90% metals removal and the majority of metals remaining are in the dissolved form. This information was submitted to EPA, as input for the Case Study, in an EOA September 23, 1996 memo (incorporated herein by reference). As stated in that memo, the low-end treatment option (high lime treatment) with an annual cost of $9.8 million, was not guaranteed to consistently achieve a 4.9 ug/L copper effluent limit. Only the reverse osmosis based treatment option, at $42.1 million per year could likely produce effluent in the 4.9 ug/L copper range, since this is a maximum limit (i.e. never to be exceeded) not an average limit as incorrectly assumed in the CTR (see below). EPA need to provide, in the CTR, the specific plant performance data, apparently from the RREL Treatability Database, that supports the contention that minor levels ($100,000) of plant optimization can achieve the proposed low part per billion metals concentrations.

Comment: Finally, we have serious concerns about the accuracy of the draft Economic Analysis and the estimates of the costs and benefits of the draft CTR (see detailed comments in Attachments I and 2). Our primary concerns related to the cost analysis include 1) that the case studies on which the cost analysis is based do not adequately represent the actual population of POTWs in California; 2) the omission of costs that could be incurred by many sectors that contribute to overall loadings, and, hence, can be expected to have to reduce their loadings (e.g., non-SIU indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources of CTR-regulated pollutants); 3) the use of numerous assumptions that underestimate costs; and 4) the capricious removal of costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the lack of any proposed regulatory relief trigger in the proposed regulation.

To illustrate the degree of underestimation of costs for the POTW sector alone, we looked at potential compliance costs for the POTW sector. We found that the potential costs for 23 major POTWS. on an annualized basis, may reach $400 million. We believe that this analysis demonstrates that the potential cost consequences of compliance with effluent limits based on the proposed CTR criteria would easily exceed the $ 100 million annual cost threshold, especially when the costs of all 313 POTWs in the State are estimated. Thus, we believe that EPA must conclude that the proposed CTR could have significant economic impacts on local governments.

Comment: 4. The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. The District's analysis demonstrates that actual costs may be an order of magnitude greater than EPA's $500/lb threshold and that the benefits are very small.

Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that effluent metals levels can be reduced to the low levels necessary to ensure compliance without any capital costs, by adding lime to existing primary tanks.

Response to: CTR-040-032

The U.S. EPA Treatability Database indicates that chemical precipitation with addition of lime is a technology capable of removing metals at the concentrations and loading reductions required. For example, several treatment plants have reached concentrations of 7.7 ug/L for copper based on a pilot study (CTR-based level for copper is 8.03 ug/L) and 0.46 ug/L for silver (CTR-based level for silver is 1.51 ug/L) (U.S.EPA RREL). Some of the sample facilities already have a clarification system in place, therefore, only capital costs for the lime feeding and conveying system need to be considered. For facilities without clarifiers, the capital cost of a primary clarifier is also included in EPA's cost estimates. EPA's cost estimates are based on EPA's Treatability Manual (1980) and are adjusted for inflation.

Comment: EPA may have greatly underestimated the cost of metals removal. EPA assumed that significant metals reductions could be achieved without any capital costs by adding lime to existing primary sedimentation tanks. But, this would increase the amount of primary sludge produced (as much as 5 times at high lime dosages) and could therefore necessitate additional sludge handling costs. Further, there is no evidence that addition of lime to the primary sediment tanks could achieve the low effluent levels required to achieve some of the metals criteria (e.g., the saltwater copper criteria). Most engineers who have addressed this issue have assumed that tertiary lime treatment would be necessary. In the Bay Area Dischargers Association analysis, tertiary limetreatment was six times the cost of primary lime addition.

Response to: CTR-041-034

EPA assigned separate costs for residuals removal (including sludge) where it was appropriate. EPA did not add any residuals removal costs to Sacramento Regional Wastewater Treatment Plant in association with the process optimization study that was assigned in EPA's cost estimate for the facility. EPA disagrees that lime addition cannot meet the CTR-based limits; see response to CTR-040-032.

Comment: 4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution;

(2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements;

(3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and

(4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule.

The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act.

Comment: EPA may have greatly underestimated the cost of metals removal. EPA assumed that significant metals reductions could be achieved without any capital costs by adding lime to existing primary sedimentation tanks. But, this would increase the amount of primary sludge produced (as much as 5 times at high lime dosages) and could therefore necessitate additional sludge handling costs. Further, there is no evidence that addition of lime to the primary sediment tanks could achieve the low effluent levels required to achieve some of the metals criteria (e.g., the saltwater copper criteria). Most engineers who have addressed this issue have assumed that tertiary lime treatment would be necessary. In the Bay Area Dischargers Association analysis, tertiary lime treatment was six times the cost of primary lime addition.

Comment: The draft Economic Analysis has serious flaws. It underestimates the costs of the draft CTR and overestimates the benefits. For the cost analysis, EPA should reevaluate the representativeness of the sample used; the omission of impacts on many sectors that contribute to loadings, and hence, can be expected to have to reduce their loadings (e.g., small indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources); the incorporation of numerous assumptions that underestimate costs; and the assumption to artificially remove costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the fact that they are not automatically granted through triggers included as part of the proposed regulation.

Comment: With respect to other criteria proposed for adoption in the draft CTR, we recommend that USEPA:

4. Review and correct existing flaws in the current "Economic Analysis."

With respect to the Economic Analysis conducted by USEPA, we are concerned that it underestimates the cost of the proposed CTR rule while overestimating its benefits. We suggest that USEPA re-evaluate (1) the representativeness of the sample used; (2) the omission of impacts on many sectors that contribute to loadings; (3) the incorporation of a variety of assumptions that underestimate costs; and (4) the assumption to artificially remove costs that exceed threshold values by incorrectly assuming that regulatory relief measures will be granted. For the benefits analysis, USEPA should utilize more California-specific and recent information. A further problem with the analysis relates to the establishment of criteria that are below analytical detection. Lacking credible data, it was not possible to conduct cost-benefit analyses or determine that any set of control measures would or could lead to compliance. This fundamental inability to utilize established rulemaking procedures requires, in our opinion, further work prior to the promulgation of the criteria.

Comment: CDA is a strong supporter of water quality and human health protection. CDA's primary goals in commenting on the draft CTR are to request that mercury criteria be based on sound science and that mercury regulation be implemented via a watershed management, phased TMDL-type approach.

CDA is particularly concerned that the CTR does not adequately assess the economic impacts on indirect dischargers nor the extent to which there will be measurable water quality benefits solely from adoption of the proposed mercury criteria for point sources.

Economic Analysis

CDA supports CASA/Tri-TAC's conclusions that the Economic Analysis has significant technical weaknesses, is based on a large number of assumptions and minimal empirical data, and that it understates costs and overestimates benefits. The analysis found that mercury reductions of 80.4% and 51.7% would be required under the high-end and low-end scenarios, respectively. The economic analysis needs to evaluate costs and feasibility of attainability based on actual treatment plant mercury removal performance data with associated detection limits. It also needs to evaluate costs under the scenario that dilution credit would be eliminated when calculating effluent limits for bioaccumulative constituents of concern, such as mercury, for deepwater dischargers within or capable of impacting mercury nonattaininent areas.

Response to: CTR-086-003

EPA did examine detailed treatment information and pollutant removal performance data at the sample facilities to evaluate the feasibility and potential costs of meeting CTR-based WQBELs. EPA estimated that seven facilities would incur costs to meet the CTR-based effluent limits for mercury. When this information was limited, the assessment of pollutant removal feasibility was also based upon the reviewing engineer's best professional judgement using general knowledge of industrial and municipal operations.

Dilution factors used to calculate water quality based effluent limits were based on the dilution allowed within the current waste discharge requirements for each sample facility. Of the 20 sample facilities, only four were provided with dilution factors. WQBELs for the remaining facilities were based on a dilution of zero. When this sample is extrapolated to the universe, over 94% of point source dischargers are estimated to not be allowed dilution. EPA believes that this is a highly conservative estimate that will likely overestimate potential costs.

Comment: And finally, I'd like to comment on the analysis of the economic impact of the CTR. We

believe that the analysis does not portray a reasonable picture of what the potential costs and benefits may result from the promulgation of this CTR. In our opinion, the cost analysis contains many flawed assumptions that result in severe underestimation of the total potential costs, and we're particularly concerned about the use of process optimization and how it was relied upon.

Likewise, the benefits, while admittedly difficult to estimate, appear tenuous at best. The bottom line is that we are concerned that this analysis does not properly reveal that the CTR can lead to requirements for large expenditures by POTWs in Southern California with questionable benefits to the environment. We recommend that EPA carefully redo its economic analysis to portray a more accurate picture of the potential costs and benefits.

Thank you again for this opportunity. We look forward to submitting our comments in writing.

Comment: We have reviewed the proposed CTR and offer the following comments:

4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. Additional concerns with the economic analysis are presented in Exhibit F. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act. The City, for example, is a small community having a population of under 50,000 and would be greatly impacted by the proposed rule.

Comment: Second, the interaction between the CTR and the state's implementation policy is particularly important given our second concern, which is namely that the EPA's economic evaluation underestimates the costs and overestimates the benefits of implementing this rule.

Our concern about the cost estimates is based on the fact that the cost analysis appears to undervalue the magnitude of difficulty dischargers will have complying with permits issued based on this rule.

We are also concerned that the cost estimates for various compliance activities such as source control and treatment process optimization made in the case studies are overly optimistic and not reflective of the true actions that will need to be taken to insure compliance.

Overall, we are concerned that the expenditures that may be necessary for many POTWS to comply with the CTR will be large, these costs may not be matched by commensurate benefits, and that EPA has not analyzed whether point source controls are in fact a cost-effective way to achieve water quality standards.

Our preliminary analysis for just five agencies in the Bay Area to comply with the proposed standard for copper alone could amount to more than $60 million per year -- 60 million. This number would be far higher if calculated for every pollutant listed in the CTR for the entire POTW industry in California.

Since this estimate would undoubtedly exceed the high end of the range contained in EPA's analysis, we believe it is necessary for EPA to redo the economic analysis to fully comply with its legal responsibilities.

In addition, revised economic analysis is necessary to provide a sound basis for the State to use in its analysis of the economic impacts of the implementation policy.

Comment: 12) The cost analysis suggests that there is little difference between the cost of using a risk level of 10E-6 versus 10E-5. The reason for that is in all likelihood the fact that many of these criteria are below the detection level at both risk levels. Under the assumptions used their would be no cost to either scenario.

Response to: CTR-003-012

As part of its revised cost analysis, EPA estimated the changes in estimated costs and pollutant load reductions based on the lower risk level of 10-5. Under the low scenario, costs decrease by $1.1 million, approximately 11% less than the costs based on the higher risk level. Under the high scenario, annual costs decrease by $5.8 million, also an 11% decrease from the costs based on a 10-6 risk level. Pollutant load reductions attributable to use of a lower risk level are estimated to decrease by approximately 4% and 1% under the low and high scenarios, respectively. The relatively low sensitivity of costs to the change in risk level primarily is related to the fact that most of the potential costs related to implementing the CTR are being driven by metals. Changes in risk levels for carcinogens primarily affect organic pollutants.

Comment: Appendix III-B:

The analysis conducted in Appendix III-B is essentially the same as that shown in the previous appendices, except that it is assumed that the dissolved criteria converts directly to a total criteria (translator =I). The implication of this is methodological assumption that 100% of the total pollutants discharged in the effluent are in dissolved form. Results from this appendix represent an absolute worst

case, are misleading and inappropriate. It has been shown that the assumptions used to generate the analysis in Appendix I-B (TSS, translator values, and 95%tile values for chronic WLAs) are already highly conservative.

Response to: CTR-021-015

The criteria for metals in the proposed rule are expressed in the dissolved form. Permitting regulations, however, require that permit limits be set in terms of total recoverable metals concentrations. Therefore, permit writers must "translate" dissolved criteria to derive total recoverable permit limits which can be done through a variety of methods. The preferred methodology employs site-specific information to derive the translator. However, since not all site-specific information was available, the base case analysis used a second method, the theoretical partitioning relationship, to estimate the translator. According to recent EPA guidance on translators, this method usually tends to overstate the stringency of the derived permit limit compared to the site-specific method, although it will sometimes understate the stringency (U.S. EPA, 1996). A third method is to simply use the total recoverable criteria that are derived by dividing the dissolved criteria by the conversion factor. This method is very conservative and will, in nearly all cases, result in more stringent permit limits compared to the site-specific method.

EPA performed a sensitivity analysis to estimate the effect of the use of total recoverable criteria on CTR-based WQBELs, total costs, and load reductions. CTR-based WQBELs are calculated using the same methods described in Chapter 4 of EPA's Economic Analysis, except that total recoverable criteria are used in place of dissolved criteria for metals. The analysis shows that a significant increase in costs can be expected by using total recoverable criteria, as compared to the costs of the theoretical partitioning approach used in the base case analysis. Potential annual costs under the low scenario are $62.4 million per year, an approximately two-fold increase over the estimates in the low base case analysis. Under the high scenario, total costs are estimated to be nearly $325 million per year, over five times the cost estimates in the base case analysis. Potential load reductions are estimated to increase by approximately 14% over the low base case scenario, and by nearly 7% under the high scenario. Using conversion factors as translators would result in significantly higher costs per toxic pound-equivalent removed than the base case analysis. The cost-effectiveness of the low scenario is $50 per toxic pound-equivalent removed compared to $31 per toxic pound-equivalent removed in the base case analysis. The cost-effectiveness of the high scenario is $111 per toxic pound-equivalent removed compared to $22 per toxic pound-equivalent removed in the base case analysis.

Although the cost effectiveness for this translator sensitivity analysis is reasonable, EPA believes that the costs estimated from this analysis greatly overstate true costs. EPA expects that in cases where a facility may incur substantial economic impacts due to an effluent limit for a metal, there will be strong incentives for the facility or the state to develop site-specific data, which will result in more realistic translators, thus reducing potential economic impacts. EPA believes that the cost estimates developed using the theoretical partitioning approach in the base case are more realistic than the cost estimates from this sensitivity analysis.

Comment: EPA has greatly understated the potential attainability problems associated with the CTR. This also includes numerous erroneous assumptions made in the EA, such as those described by BADA, CASA/Tri-TAC, and M.Cubed. Larry Walker Associates prepared an Attainability Analysis for the BADA agencies, copy attached. That analysis concluded that BADA agencies will not be able to comply with effluent standards for copper, nickel, pesticides (Aldrin and Heptachlor), and PAHs [Benzo(a)Pyrene, Dibenzo(a,h)Anthracene, and lndeno(1,2,3-cd)Pyrene]. Removals ranging from approximately 20% to nearly 90% will be required. Without major revisions to the CTR, the cost for compliance will be more than $130,000,000 annually. These costs represent only the BADA agencies. Actual costs for all POTW dischargers to San Francisco Bay would be at least an additional 40%, bringing the total annual cost for San Francisco Bay ratepayers to more than $185,000,000 on a strictly flow proportional basis. Since the non-BADA POTWs are significantly smaller, capital costs would actually increase due to loss of economy of scale. Therefore, actual costs for San Francisco Bay could easily exceed $200,000,000 per year - all for the sole purpose of removing between 1-10% of the "Estimated Share of Toxic Loadings Attributable to Point Source."(*1)

(*1)United States Environmental Protection Agency, Office of Water 4301, EPA-820-B-96-001, July 1997, Economic Analysis of the Proposed California Water Quality Toxics Rule, Executive Summary, Page ES-10, Exhibit ES-3. Estimated Share of Toxic Loadings to California Surface Waters Attributable to Point Sources.

Response to: CTR-052-005a

EPA disagrees with the annual compliance cost estimate of $130 million taken from an attainability analysis performed for BADA. This figure represents the higher of two estimates presented in the BADA analysis and corresponds to the use of tertiary lime addition. The lower cost estimate ($68 million) presented in the analysis is based on lime addition to primary tanks. The attainability analysis also uses the costs for the City of Merced from EPA's economic analysis of the proposed CTR as a basis for estimating carbon adsorption costs.

In EPA's revised economic analysis, EPA no longer estimates that the City of Merced will need to add costly granular activated carbon (a cost of $4.2 million annually) to comply with CTR-based limits. EPA's revised analysis indicates that pollution prevention and process optimization (a cost of $594,000 annually) should be sufficient to ensure compliance with CTR-based limits. If EPA's revised cost estimate were used, the BADA cost estimates would be significantly lower because $56 million of both estimates is based on the old Merced cost estimate.

The BADA analysis also provides an estimate of costs for San Jose, one of the sample facilities in EPA's detailed cost analysis. The BADA analysis estimates costs of $7.75 million to $54.07 million for copper reductions (nickel reductions are included in the pollution prevention costs for copper). BADA

estimated a 54% reduction for copper and a 5% reduction for nickel. EPA's analysis contained a 17% required reduction for copper and none for nickel with estimated annual costs of approximately $300,000 for pollution prevention under the high cost scenario.

The differences in load reductions between BADA and EPA's analyses result from the different baselines in the two analyses. BADA uses a 99.9% probability estimate for metals and the maximum observed concentration for organics as its baseline to estimate loading reductions. EPA uses the existing NPDES permit limit or, in the absence of an existing limit, the maximum effluent concentration to estimateloading reductions which are then considered when assigning costs to reach the necessary load reductions.

BADA's analysis assumed pollution prevention costs for reductions of up to 10%, whereas EPA considered pollution prevention an option for reductions of up to 25%. EPA believes that a 25% loading reduction is a more realistic cap for pollution prevention efforts than 10%. EPA's analysis assumes that facilities will try to meet CTR-based limits using the least cost option and, for loading reductions between 10% and 25%, EPA believes that pollution prevention or process optimization are the more likely options over end-of-pipe treatment.

EPA did not assign costs mechanically based on unrealistic guidelines and statistical procedures to predict worst-case effluent quality as a means for determining compliance as was done in the BADA analysis. EPA's cost decision matrix allows for the consideration of the available monitoring and permit data in the context of detection limits, facility processes, and potential irregularities in plant operations which might result in abnormally high data. EPA believes that its methodology is more appropriate for assessing data and estimating costs than that used by BADA.

Comment: IMPACTS ON THE AUTHORITY AND ITS MEMBER AGENCIES

Attainability Analysis. The Attainability analysis performed by Larry Walker Associates and Authority staff concludes that the Authority will not be able to comply with effluent limitations for copper, heptachlor, Dibenzo(a,h)Anthracene, and possibly Benzo(a)Anthracene. The following table summarizes compliance issues and solutions.

Pollutant	% Removal Required	Remedy
Copper	8-9	Pollution Prevention
Heptachlor	88	Carbon Adsorption
Dibenzo(a,h)Anthracene	30	Carbon Adsorption

Benzo(a)Anthracene 10 Pollution Prevention?

In addition, it is unknown whether future compliance issues would arise for numerous pollutants where the current Method Detection Limits (MDL) are above the anticipated effluent limitations. As noted previously, EPA's assumption that non-detect data equals compliance, and therefore, no costs is not justified. Only POTWs with the most resources have real data or many pesticides and PAHS. Smaller facilities tend to have nothing but non-detect data. Since the Authority and other BADA agencies have detected these pollutants, it is reasonable to assume that other agencies would if they used lower detection limits. Therefore, it is logical to assume that once technology provides lower detection limits, other compliance issues will arise.

Comment: Attainability Analysis

Based on our review of the CTR, at least seven of the Sanitation Districts' Water Reclamation Plants (WRPS) would be affected by the proposed rule. They include the Pomona WRP (15 MGD(*1)), the Whittier Narrows (15 WRP), the San Jose Creek WRP (100 MGD), the Los Coyotes WRP (37.5 MGD), the Long Beach WRP (25 MGD), the Saugus WRP (6.5 MGD) and the Valencia WRP (12.6 MGD). The seven WRPs treat mainly residential and commercial waste, with less than 10% of the influent coming from industrial sources. On an annual basis, over 38% of the reclaimed water is reused for applications including groundwater recharge, landscape irrigation and industrial uses. The remainder is discharged to inland surface waters that are effluent dependent water bodies. The existing and potential designated uses of the receiving waters are diverse and include groundwater recharge, water recreation, warm fresh water habitat, wildlife habitat; commercial and sport fishing; wildlife habitat; rare, threatened or endangered species; and spawning, reproduction, and early development.

A preliminary review of historical monitoring data has shown that plant effluent concentrations of mercury, lindane and four trihalomethanes (bromoform, chlorodibromomethane, chloroform and dichlorobromomethane) frequently exceed the proposed CTR criteria at each of the seven plants. Further evaluations were conducted to determine if loading reductions could be achieved through source control or pollution prevention options and/or treatment.

Source Control and Pollution Prevention Options

The Sanitation Districts' industrial waste pretreatment program was established to ensure that all treatment facilities are able to comply with waste discharge requirements; to protect the public and the environment; and to protect personnel and facilities from potentially harmful industrial wastes. To achieve these objectives, a systemwide pretreatment program was created in 1972. The program presently regulates an extensive and varied industrial base consisting of 3,300 industries, of which 1,335 are Significant Industrial Users (SlUs).

For the CTR constituents of concern, our review has shown that there is very little potential for achieving additional reductions in pollutant loadings through source control or pollution prevention. In the case of mercury, we estimate that only 4% of the influent mercury loadings are from industrial sources. Thus, reductions of the mercury industrial contribution to meet the proposed CTR criteria would be ineffective. The same is true for other POTWs in California. For example, a 1997 study(*2) conducted for the City of Palo Alto demonstrated that the primary sources of mercury to the Palo Alto Regional Water Quality Control Plant were from residents (46%), the water supply (22%), dentists (9%), permitted industries (4%), storm water inflow (3%), employee-related human waste (30%), Stanford University (30%) and other sources (1%). None of the regulated dischargers in the Palo Alto service area used mercury in any manufacturing process. In addition, a study conducted for the Central Contra Costa Sanitary District, which serves an estimated population of 236,200, showed that over 11 pounds per year of mercury were discharged by residential sources including human waste, laundry greywater, thermometers, contact lens solution, household products and food waste. Since residential contributions of mercury are so significant, there are very limited options for control other than educational outreach programs and/or implementation of best management practices, which may have limited effectiveness yet can be costly to develop and implement.

In the case of lindane, pollution prevention is also not feasible. The primary sources of lindane can be traced to consumer products such as flea shampoos for pets and human lice shampoo. Traditional methods of source control such as permitting or the application of best management practices would not be practical or effective. The only viable source control alternative would be a ban on constuner products that use lindane as an active agent. This approach would require the cooperation of federal and state agencies, and the manufacturers of the commercial products. Since these products have a legitimate use for public health protection, some substitute product would need to be provided. Presumably, EPA would need to determine if replacements for lindane were more or less environmentally friendly in terms of overall water quality protection,

Trihalomedwes (THMs) are another example of where source control is not feasible option. Current maximum contaniinant levels allow for chloroform, bromoform, chlorodibromomethane and dichlorobromomethane concentrations up to 100 ug/L in drinking water that is used upstream and discharged to POTWs. The average concentration of THMs in the influent to the Sanitation Districts' water reclamation plants ranges from 2 ug/L to 10 mg/L, well below the drinking water standard, yet above the proposed CTR criteria. We believe that the drinking water supply accounts for almost the entire loading. Since local water supplies are in compliance with drinking water standards, no further source control options are viable.

Based on this assessment, it is apparent that EPA drastically underestimated the costs of the CTR by assuming that in many cases compliance could be achieved through source reduction or pollution prevention. EPA's assertion that 10 to 25 percent reductions in current discharge levels is "insignificant," and would be fully addressed by low-cost waste reduction strategies clearly does not take into consideration the fact that much of the priority pollutant loading to POTWs comes from residential and commercial sources rather than industrial sources.(*4) The former are considerably more diverse and

numerous, and not easily controlled.

Since it is unlikely that source control or pollution prevention measures by themselves will ensure compliance with the CTR, advanced treatment at the Sanitation Districts' seven WRPs would be required. Our preliminary evaluation of viable treatment options indicates that reverse osmosis (RO) would be needed to remove the constituents of concern. Although other forms of advanced treatment such as air stripping and/or carbon adsorption could be used to reduce lindane and trihalomethane concentrations in the treated wastewater to acceptable levels, they would be ineffective for treating mercury. Thus, RO was selected based on its ability to effectively treat mercury, lindane and the trihalomethanes.

The preliminary cost estimate for providing RO treatment at each of the seven WRPs is significant. For exwnple, just the estimated capital investment (including construction, engineering and administrative costs) alone exceeds $470 million collectively for the seven plants.(*5) When amortized over IO years at a 7% interest rate, the capital investment is approximately $68 million per year. After including the estimated annual operation and maintenance costs of approximately $79 million, the total annualized cost for RO treatment at the seven WRPs is approximately $148 million. To put this estimated cost into perspective, the addition of RO treatment would double the single family home service charge rate for the Sanitation Districts' Joint Outfall System (JOS) service area and triple the service charge rate for the Santa Clarita Valley Joint Sewerage System (SCVJSS) service area.(*6)

Further investigation into the amount of wastewater requiring treatment at each facility and the optimal combination of treatment will be performed in an effort to fine tune the cost estimates. It is likely that if RO treatment is added, only a portion of each plant's wastewater flow would be treated and subsequently blended with non-RO treated wastewater to meet the proposed limits. Itis also possible that the optimum advance treatment system may include carbon adsorption, air stripping and RO. For the two WRPs in the SCVJSS, additional costs will be incurred for providing facilities for brine disposal associated with the RO treatment process. Preliminary cost estimates indicate that the capital costs for a brine line would be $45 million, corresponding to an amortized cost of $6.4 million per year over I 0 years at a 7% interest rate. Further work is nee" to refine these and the other estimates. Although the cost estimates presented are somewhat preliminary, they are believed to accurately represent the order of magnitude of cost for the Sanitation Districts to achieve attainment with the proposed CTR criteria.

(*1) Design capacities are indicated for each plant.

(*2) EIP Associates. Mercury Source Identification. August 1997.

(*3) Larry Walker Associates. Residential Metals Study. May 1994.

(*4) U.S. General Accounting Office, "Water Pollution: Nonindustrial Wastewater Pollution Can Be Better Managed" (GAO/RCED-92-40, December 1991), Ch. 2. Treatment Options and Costs

(*5) The RO costs estimates (including capital and operation and maintenance) are based on information obtained from Orange County's Water Factory 21 facility and the 1982 Orange and Los Angeles Counties Water Reuse Study Facilities Plan.

(*6) The treatment figures represent the total population and number of businesses actually served by the seven WRPs. However, it should be noted that the plants service separate treatment systems. Five of the WRPs are part of the Joint Outfall System (JOS), which serves a total of 5 million people and over 3,300 permitted industries. Because the rates for these plants are calculated based on the costs for the entire

system, which includes the Joint Water Pollution Control Plant, increases in rates due to installation of new treatment systems would be home by all users of the JOS. This would, of course, result in lower costs on a sewage unit basis (i.e., per household), although far more people would experience rate increases. The remaining two WRPs provide treatment for the Santa Clarita area, which has a significantly lower population than the JOS. The service charge rates for this area are 57% higher that those of the JOS, so any rate increases would have a disproportionately high impact on those communities.

Response to: CTR-059-027

LACSD dismisses pollution prevention as "costly to develop and implement" in favor of reverse osmosis, a very expensive treatment technology. EPA disagrees that pollution prevention cannot be effective in reducing pollutant loadings from sources other than industrial sources. EPA compiled two documents, Overview of Pollution Prevention Approaches at POTWs and Pollution Prevention at POTWs, a Resource List (available in the record for this rulemaking), which identify successful programs to reduce mercury and lindane through public education and source controls. EPA believes that facilities will employ lower-cost alternatives such as pollution prevention before resorting to expensive additional treatment processes to achieve CTR-based limits, such as reverse osmosis. The trihalomethanes that occur in concentrations above CTR-based criteria but below drinking water standards are disinfection byproducts and may be manageable through process optimization (see response to CTR-003-013).

Comment: Comment #5: Related Issues on Policy Assumptions

(Re: Page I-A-11 of the "Technical Support Document (Appendices)" for the "Analysis of Potential Costs Related to Implementation of the California Water Quality Toxics Rule)

The page cited above presents an Alternative Analysis for the City of San Jose with regard to the discharge quality of the San Jose/Santa Clara POTW effluent compared to that which would be permissible under the CTR for copper. The text states:

"Note that for the exception of outlying values, the average concentrations are low and within the range of the potential CTR limits."

It is precisely those outlying values which cause the San Jose/Santa Clara POTW to be in noncompliance

with its NPDES permit. It seems circular at best for EPA to take specific note of the very factors which create non-compliance with the permit and then assume them away and determine that San Jose/Santa Clara will have no cost of meeting the CTR copper criteria because our costs are really those of complying with the permit standard -- which does not except outlying values.

The cited text further states that "To achieve these reductions, the City is assumed to prefer an aggressive pollution prevention program by targeting specific industries and focusing on commercial dischargers." Note that this has already been undertaken and is insufficient, to allow compliance with expected permit limits.

Questions for EPA on Comment #5:

Q.5-1) As alluded to earlier in the comment regarding application of the analysis to San Jose, we are concerned that the assumptions incorporated in the Model #2 high end scenario understate the actual costs of meeting the CTR. Does EPA support the exclusion of outlying values in the State's calculation of compliance? How would the high end costs change were San Jose/Santa Clara to be considered in compliance, thus incremental costs would analytically accrue to the CTR?

Q.5-2) What evidence brought EPA to the conclusion that the City would "prefer an aggressive ... focusing on commercial dischargers"? How would changing that assumption affect the costs of implementing the CTR?

Response to: CTR-092-021

EPA disagrees with the commenter that the high scenario understates costs. EPA believes that the high scenario actually overstates costs because the high scenario is based on existing permit limits and not effluent data. If effluent data is actually below the existing limit, as it is for San Jose, then compliance costs may be overstated. EPA does not support the exclusion of outlying values in assessing compliance. In fact, EPA considers all data including outliers when it is estimating treatment requirements. However EPA does not include the costs for facilities to come into compliance with existing permit limits because these costs would be incurred even without the CTR. EPA estimated costs for San Jose to move from compliance with existing permit limits to the CTR-based limits, thus the high scenario cost estimate for San Jose would not change if San Jose were considered in compliance.

EPA's revised cost analysis for San Jose no longer mentions an "aggressive pollution prevention program." Under the revised cost analysis, the required reductions are low (17% for copper, 0% for silver, and 2% for chloroform). Thus, EPA assigned pollution prevention for the metals and process optimization for chloroform to ensure compliance with CTR-based limits. EPA's revised cost estimates for San Jose are $296,000 under the high scenario and $57,000 under the low scenario.

Comment: Additionally, CBIA and CBPA are concerned with the findings in the "Economic Analysis of the Proposed California Water Quality Toxics Rule." The acknowledgment by EPA in the economic analysis that "the water quality criteria in this rule may also have an indirect effect on sources not permitted under the NPDES program or not subject to numeric water quality-based effluent Emits is extremely troublesome. Sources not permitted under the NPDES program include nonpoint sources and wet weather discharges such as runoff from farms and urban areas. The economic analysis continues by stating that "any potential effect on these sources is unknown at this time" and that "the State may ask or require these sources to implement best management practices or participate in a comprehensive watershed management approach. Since the economic analysis only focuses on the costs to point source dischargers and not non-point discharges, CBIA and CBPA believe that the potential economic impact of the proposed rule is greater than identified in the economic analysis.

We thank you for your consideration of these comments.

Comment: Economic Analysis

The Sanitation Districts commends EPA for preparing an analysis of the economic impacts of the proposed CTR, and for selecting POTWs for half of the case studies. We believe that EPA is correct in thinking that POTWs are likely to experience major impacts as a result of the promulgation of the CTR. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Our own attainability and cost analysis indicates that there are indeed fundamental flaws in the cost analysis. A few of the areas of concern are listed below:

* The Economic Analysis presents a very weak analysis of potential benefits, which is based on limited information about ambient water quality conditions. Due to this weakness, combined with the paucity of information in the literature regarding the benefits from marginal improvements in water quality, the benefits analysis does a poor job of evaluating the marginal benefits that would result from the implementation of the CTR.

Comment: 7) The economic analysis assumes that where the proposed criteria cannot be economically met, the EPA or State will take some action such as setting new criteria which will result in no cost to the discharger. This is totally inappropriate. First there is no assurance that relief can or will be given. At a minimum, studies will have to be performed to support a proposed action. The cost of such studies can and historically have been significant, ranging from hundreds of thousands to millions of dollars per study. These costs are borne by the effected communities not the EPA or State. Most importantly, the EPAs position that once promulgated, they do not have the resources to modify this rule in a timely manner, is in contradiction to this assumption.

Response to: CTR-003-007

See responses to CTR-032-004 and CTR-060-019.

Note also that, because there is no assurance that specific dischargers will receive regulatory relief, EPA estimated potential compliance costs under the assumption that none of the facilities with significant costs would be allowed alternative regulatory approaches (i.e., the high scenario).

Comment: Las Gallinas Valley Sanitary District (District) submits the following comments on the proposed California Toxics Rule. The District owns and operates a 2.9 mgd advanced secondary municipal wastewater treatment plant that discharges into northern San Francisco Bay. The San Francisco Bay Regional Water Quality Control Board (RWQCB) considers the District a shallow water discharger and does not allow dilution credit in calculating effluent limits. As such, the District faces considerable difficulties in complying with end-of-the-pipe limits for copper, mercury and potentially

several toxic organics that have proposed objectives lower than the currently available analytical detection limits.

The District has had in place for several years, comprehensive source control, pollution prevention and waste minimization programs similar to those of much larger dischargers. While we continue to look for ways to improve our programs, we believe that we have passed the point of diminishing returns and that there is not a significant potential for additional pollutant removal via these mechanisms. The vast majority of copper loading, as in the case of most Bay area shallow water dischargers, is from the potable water supply and corrosion of residential copper plumbing. Plant optimization is being investigated but to date also does not appear to promise more than marginal increases in particulate copper removal, at moderate to significant costs.

Therefore, contrary to the conclusions of the CTR economic analysis, we do not believe that implementation of additional pollution prevention measures and/or plant optimization are viable mechanisms for the District to achieve current or proposed CTR criteria. Regulatory relief, as we have requested during our NPDES permit renewal process, is required.

Response to: CTR-032-001

The Las Gallinas Valley Sanitary District (District) did not provide enough information for EPA to analyze whether pollution control measures and/or process optimization would be viable mechanisms for compliance with CTR-based limits. In particular, the facility would need to provide facility engineering data and existing permit limit information and effluent data for copper and mercury. Such specific data are required to determine how the economic analysis assumptions and methodology (e.g., cost decision matrix) would apply to this particular facility. Despite this, review of the comment letter suggests that the District presently is not in compliance with existing effluent limits for copper and mercury and that regulatory relief already has been requested for these constituents. Information submitted by the Novato Sanitary District, another wastewater treatment plant discharging to northern San Francisco Bay and classified as a shallow water discharger, indicates that the present effluent limits for copper and mercury are 2.9 ug/L and 0.03 ug/L. As indicated in the response to CTR-005-001, these limits are likely to be more stringent than permit limits calculated using CTR criteria and EPA's methodology (e.g., which uses dissolved criteria and metals translators). Although the information submitted by the District is not sufficient to fully evaluate their comments, EPA believes that it is likely that the CTR would not result insignificant costs because existing discharge limits seem to be more stringent than CTR-based limits. Nonetheless, the decision to grant regulatory relief is not a federal responsibility, but a place-based decision that must rest solely in the hands of the local community, elected officials, and other stakeholders that use the water resource affected by such decisions.

Comment: The use of the $200 and $500 per toxic-pound equivalent of pollutant removed cost thresholds significantly skewed potential costs downward by assuming that when those cost thresholds are reached, regulatory relief options would be pursued successfully. The CTR should include an evaluation of costs assuming regulatory relief is not made available. While the District supports the various regulatory relief options referenced, such as site specific objectives and watershed based phased TMDLs, dischargers have absolutely no guarantees that such regulatory relief will indeed be provided. Furthermore, regulatory relief conveys a negative connotation to these actions; most are more accurately viewed as "sound science", actions that should be taken anyway in pursuit of more technically defensible objectives and limits that will fully protect water quality.

Response to: CTR-032-004

As described in the EA that accompanied the proposed CTR (SAIC and Jones and Stokes Associates, 1997), EPA assumed that regulatory alternatives such as phased total maximum daily loads/water quality assessments, site-specific criteria modifications, standards variances, metals translators, etc., are considered under certain circumstances. Specifically, under the low-end scenario, regulatory alternatives were assumed necessary if the cost for a sample facility exceeded $200 per toxic pounds-equivalent (in practice, regulatory relief mechanisms are available even when costs are below $200 per toxic pounds-equvalent).

EPA assumes that a facility, when faced with the challenge of meeting water quality-based effluent limitations (WQBELs) based on CTR criteria, will select the most cost-effective controls, including regulatory alternatives. In fact, this has been the case in California, where several major POTWs have performed studies in pursuit of regulatory alternatives such as metals translators and site-specific criteria, rather than install costly controls to comply with WQBELs. EPA acknowledges that the actual cost-effectiveness value will vary by facility depending upon many factors, including the characteristics and volume of discharge, the receiving water, etc. However, EPA disagrees that the cost trigger is unrealistic, as these avenues of regulatory relief do exist and are employed to implement the water quality standards program.

Nonetheless, in the high-end estimate developed for the cost analysis accompanying the final CTR, no cost trigger was used and, thus, EPA's high-end cost estimate did not include the use of a regulatory alternative for any sample facility.

Comment: Finally, we have serious concerns about the accuracy of the draft Economic Analysis and the estimates of the costs and benefits of the draft CTR (see detailed comments in Attachments I and 2). Our primary concerns related to the cost analysis include 1) that the case studies on which the cost analysis is based do not adequately represent the actual population of POTWs in California; 2) the omission of costs that could be incurred by many sectors that contribute to overall loadings, and, hence, can be expected to have to reduce their loadings (e.g., non-SIU indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources of CTR-regulated pollutants); 3) the use of numerous assumptions that underestimate costs; and 4) the capricious removal of costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the lack of any proposed regulatory relief trigger in the proposed regulation.

To illustrate the degree of underestimation of costs for the POTW sector alone, we looked at potential compliance costs for the POTW sector. We found that the potential costs for 23 major POTWS. on an annualized basis, may reach $400 million. We believe that this analysis demonstrates that the potential cost consequences of compliance with effluent limits based on the proposed CTR criteria would easily exceed the $ 100 million annual cost threshold, especially when the costs of all 313 POTWs in the State are estimated. Thus, we believe that EPA must conclude that the proposed CTR could have significant economic impacts on local governments.

Comment: pp. 2-24 - 2-32 (U.S. EPA, 1997b) - Cost Triggers for Alternative Regulatory Approaches The use of the $200 and $500 cost thresholds significantly skewed potential costs downwards by assuming that when those cost thresholds are reached, regulatory relief options would be pursued successfully, despite the fact that dischargers have absolutely no guarantees that such options will be successful, In the Preamble, in fact, EPA indicates that options such as variances and site-specific criteria will rarely, if

ever, be granted. In addition, POTW experiences to date in California suggest that it is unlikely that such options will be successful. Thus, the basic premise of the analytic approach used to determine costs needs to be reconsidered. Incidentally, we also believe that the costs attributed to such activities were seriously underestimated. Information we are familiar with suggests that many of the regulatory alternatives EPA examined can cost up to several million dollars (per pollutant) (e.g. TMDLs, UAAs). Thus, we suggest that in the future when calculating the costs for such activities, EPA should use a range where $200,000/pollutant is the low end scenario and $2,000,000/pollutant is the high end scenario.

Comment: 4. The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. The District's analysis demonstrates that actual costs may be an order of magnitude greater than EPA's $500/lb threshold and that the benefits are very small.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

II. Concern: The economic analysis upon which the Rule is based is seriously flawed.

* Estimates of potential costs are severely constrained due to certain assumptions including the assumption that regulatory relief from the Rule will be granted if costs are in excess of certain thresholds.

* Estimates of potential benefits are exaggerated by assuming, that the proposed water quality criteria will actually be achieved in receiving water bodies. This will not result from the implementation of the Rule because the Rule is only addressing permitted discharges to the receiving water bodies.

* The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated.

Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that permit authorities will accept metals translators when there is no history of such acceptance in California.

Response to: CTR-040-031

EPA disagrees. The State has used metals translators in the Santa Ana River in a case in which it

adopted site-specific dissolved criteria for metals. Since the CTR would establish dissolved metals criteria on a statewide basis, EPA expects that the State will accept appropriate translator studies to convert from dissolved criteria to total recoverable permit limits. The State indicated that it would accept the use of defensible translator studies in its Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (September 11, 1997, p. 10).

Comment: EPA's assumption that dischargers would pursue source control, treatment plant optimization, and regulatory relief prior to constructing end-of-pipe facilities conflicts with the 5-year maximum compliance schedule allowed by the CTR. In most cases (e.g., in the Merced POTW case study) it would take 5 years to plan, design, obtain approvals, arrange financing, and construct end-of-pipe facilities. A discharger could not pursue such non-structural controls and still be assured to meeting a 5-year compliance schedule.

Response to: CTR-040-036

EPA's compliance schedule in the final rule would allow the State flexibility in establishing compliance schedules for dischargers. EPA amended the final CTR to include a provision whereupon the compliance schedule provision will sunset in five years or when the State adopts its own compliance schedule provision in the State Implementation Policy and, if EPA approves the schedule, EPA will then act to stay the EPA compliance schedule provision for the CTR. This change to the CTR will give the State discretion to develop an appropriate compliance schedule policy for California.

Comment: 5. Concerns Regarding Economic Analysis

The District also has several significant concerns with the Economic Analysis that was performed for the proposed rule. Concerns about the cost estimates made for both the District and the state are presented here. (See attached Review of EPA's Economic Analysis of the Proposed California Water Quality Toxics Rule.) Overall, the District believes that problems with the Economic Analysis are serious enough that is should be redone. As stated above in our analysis of assumed costs at the SRWTP, the use of questionable data without qualification combined with unsubstantiated assumptions regarding costs to achieve compliance resulted in a gross underestimate in the cost-effectiveness ratio. The District's first concern is that if the types of problems found in our Case Study are widespread in other studies, the complete analysis is suspect.

In addition to the analysis of the District's facilities, there are several other points which have been used by EPA to lead to a potentially serious understatement of actual costs. The key assumptions involved are that: 1) no costs would occur if either no monitoring data presently exists or if that data is below analytical detection levels; 2) no treatment costs would occur whenever EPA's initial estimates showed high costs, due to successful regulatory relief; 3) no costs are included for nonpoint sources such as municipal stormwater management systems; and 4) no costs are included for indirect dischargers to the District's system that are not large enough to be considered a Significant Industrial User (SIU).

Regarding the first assumption, the District has found that there is pressure from many sides, including the Safe Drinking Water Act, to both increase the number of constituents being monitored and to lower detection levels to meet numeric criteria set by EPA and the state. To assume that monitoring of these new constituents will not lead to any treatment cost increases is simply unrealistic. Similarly, the second assumption about absolute success in every pursuit of regulatory relief is also overly optimistic. There are no guarantees that pursuit of regulatory relief will be successful in any situation, and EPA indicates elsewhere in the preamble that options such as variances and site-specific criteria will rarely, if ever, be granted.

The third and fourth key assumptions ignore present dominating trends and facts, i.e. that. prevention and control of pollutants at their sources, including very small indirect dischargers, storm runoff, and other nonpoint sources are now the major focus of EPA's wastewater programs nationally. While we agree that these management steps should be taken, there will be significant costs attached to the implementation of these steps that cannot be ignored.

Combined with concerns the District has heard from other sources such as the California Association of Sanitation Agencies (CASA), it appears that EPA has failed to make "a reasoned determination that the benefits of the intended regulation justify its costs." Therefore the District believes that the Agency is obligated to redo the draft Economic Analysis.

Comment: EPA's assumption that dischargers would pursue source control, treatment plant optimization, and regulatory relief prior to constructing end-of-pipe facilities conflicts with the 5-year maximum compliance schedule allowed by the CTR. In most cases (e.g., in the Merced POTW case study) it would take 5 years to plan, design, obtain approvals, arrange financing, and construct end-of-pipe facilities. A discharger could not pursue such non-structural controls and still be assured to meeting a 5-year compliance schedule.

Comment: 4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution;

(2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements;

(3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and

(4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule.

The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act.

Comment: The draft Economic Analysis has serious flaws. It underestimates the costs of the draft CTR and overestimates the benefits. For the cost analysis, EPA should reevaluate the representativeness of the sample used; the omission of impacts on many sectors that contribute to loadings, and hence, can be expected to have to reduce their loadings (e.g., small indirect dischargers, municipal and industrial stormwater dischargers, agricultural activities, and other nonpoint sources); the incorporation of

numerous assumptions that underestimate costs; and the assumption to artificially remove costs that exceed threshold values by assuming that regulatory relief measures will be granted, despite the fact that they are not automatically granted through triggers included as part of the proposed regulation.

Comment: With respect to other criteria proposed for adoption in the draft CTR, we recommend that USEPA:

4. Review and correct existing flaws in the current "Economic Analysis."

With respect to the Economic Analysis conducted by USEPA, we are concerned that it underestimates the cost of the proposed CTR rule while overestimating its benefits. We suggest that USEPA re-evaluate (1) the representativeness of the sample used; (2) the omission of impacts on many sectors that contribute to loadings; (3) the incorporation of a variety of assumptions that underestimate costs; and (4) the assumption to artificially remove costs that exceed threshold values by incorrectly assuming that regulatory relief measures will be granted. For the benefits analysis, USEPA should utilize more California-specific and recent information. A further problem with the analysis relates to the establishment of criteria that are below analytical detection. Lacking credible data, it was not possible to conduct cost-benefit analyses or determine that any set of control measures would or could lead to compliance. This fundamental inability to utilize established rulemaking procedures requires, in our opinion, further work prior to the promulgation of the criteria.

Comment: The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule (see Attachment 3). The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. BADA's analysis shows that its member agencies alone could be faced with costs in excess of $100 million per year to achieve effluent limits based on the copper, PAH, heptachlor and aldrin criteria. BADA's analysis also indicates that the benefits associated with this expenditure will be difficult to measure. Copper loadings will be reduced by 1% and the level of compliance for PAH's and heptachlor will remain unchanged at its present high level. Certainly these benefits will not measurably improve the fishing experience or measure the number of fisherman in the Bay, significantly reduce the cancer cases, or improve property values or other nonuse benefits, as estimated in EPA's economic analysis. A further consequence of the flawed economic analysis is the conclusion that the CTR is not a major rule (i.e., one which will result in excess of $100 million per year expenditure) subject to Presidential Executive order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Reform Act. BADA agencies provide service to a number of small communities with populations under 50,000 people that could be greatly impacted by the proposed rule.

Comment: The use of the $200 and $500 per toxic pound-equivalent cost thresholds significantly skewed potential costs downward by assuming that when those cost thresholds are reached regulatory relief options would be pursued successfully. The CTR should include an evaluation of costs assuming regulatory relief is not made available. While CDA supports the various regulatory relief options referenced, such as site specific objectives and watershed based phased TMDLS, dischargers, and by inference indirect dischargers, have absolutely no guarantees that such regulatory relief will indeed be provided. Furthermore, regulatory relief conveys a negative connotation to these actions; most are more accurately viewed as "sound science", actions that should be taken anyway in pursuit of more technically defensible objectives and limits that will fully protect water quality.

Comment: Major Concerns About the Proposed Criteria and Rule

1. The Proposal is Based on Poor Data and Will Not Result in Better Water Quality for California. We stated that our own attainability analysis and that of BADA show that San Francisco,) will be impacted by this rule. Unfortunately, due to the short time for review, the poor quality of data and basis for statements and assumptions in the proposal and the problem with detection limits we cannot specifically say what will be the cost to Sari Francisco. One analysis tell us it could be $2.3 million per year annualized costs and another analysis tells us it could be much more. We strongly recommend major revision to the proposal and the economic analysis before final promulgation for the following reasons:

* The costs section of the economic analysis is extremely flawed; if this rule is adopted and the State Implementation Policy does not allow for regulatory relief the cost of compliance to point sources dischargers will be orders of magnitude more than the amount stated in the proposed rule.

Comment: PROVISIONS SDG&E DOES NOT SUPPORT

As described in the following comments SDG&E does not support the following provisions:

Economic Analysis is deficient

Additionally, the metals criteria are expressed as the dissolved concentration of the metal andhave been derived from toxicity tests conducted in laboratory water that is relatively pure. Many bays and estuaries, especially back bays and estuaries contain significant concentrations of suspended organic matter. Ambient levels of organic matter can bind much of the bioavailable portion of the metal and reduce the overall toxicity due to the metal. To account for this effect, the rule allows for the use of water effects ratios (WERs) (in addition to translators) in calculating water quality based effluent limits. This may be a viable option for some dischargers to achieve compliance with the proposed criteria. However, the cost to establish a WER could be significant. EPRI(*16) has estimated that the typical costs for a basic WER study for an acute metal criterion could range from $20,000 to $50,000. To develop a WER for a chronic criterion or to address spatial or seasonal variability can substantially increase the costs. It is not clear whether the economic analysis reflects the cost to the regulated community of having to develop WERs that will effectively increase the water quality based effluent limits. This cost should be added into the economic analysis.

(*16) Implementation Manual for the Water-Effect Ratio (WER)", EPRI Report No. TR-107144, November, 1996, page 3-5.

Response to: CTR-060-019

Based upon estimates provided in SAIC (1995), the Assessment of Compliance Costs Resulting from Implementation of the Final Great Lakes Water Quality Guidance, the typical cost to facilities pursuing alternative regulatory approaches to CTR-based WQBELs is $200,000 per pollutant. The $200,000 per pollutant cost represents the mid-range of costs for a number of alternative regulatory approaches and was usd for the economic analysis of the CTR. EPA Regional Offices and States estimate that alternative approaches range from $20,000 for criteria modifications to $1,000,000 per pollutant for phased-TMDLs. These costs reflect costs associated with additional monitoring, performing special studies, and other activities, to support requests from facilities for relief from the CTR-based WQBEL. EPA estimates that the cost of calculating water-effects ratio (WER) is comparable to this typical cost.

Comment: 8) USEPA has assumed in both it's low and high end cost scenario that if monitoring data for potential chemical constituents were reported as below detection limits then there would be no cost of compliance for these constituents. The City of Riverside has 35 constituents from the list of proposed criteria, applicable to its receiving water use designations, whose limits and effluent concentrations are below analytical detection levels in our matrix. The potential cost for the City to remove even one of these constituents , should it be detected as technology improves, could exceed the projected costs of this rule for the entire state. Given that this is the case for most if not all POTWs in the State, it does not seem appropriate to implement standards for which the ability to comply is not and cannot be known. The constituents of concern at our plant are: cadmium, chromium (VI), copper, lead, mercury, selenium, silver, thallium, asbestos, dioxin, acrylonitrile, benzidine, benzo(a) anthracene, benzo(a) pyrene, benzo(b) fluoranthene, benzo (k) fluorenthene, chrysene, dibenzo (a,h) anthracene, (3,3) dichlorobenzidine, 1,2-diphenylhydrazine, hexachlorobenzene, indeno (1,2,3-cd) pyrene, aldrin, alpha-BHC, chlordane, 4,4'-DDT, 4,4'-DDE, 4,4'-DDD, dieldrin, endrin, heptachlor, heptachlor epoxide, PCBS, toxaphene. The compliance status of several other constituents would be in question if the human health criteria for consumption of "Water and Organisms" is used versus organisms only. Given the extremely low levels at which many of the criteria are set and unless the EPA is proposing a nation wide product ban, it is quite likely that one or more of these chemicals will show up in a POTW effluent at levels above the standards. The EPA should either remove from consideration criteria for which compliance cannot be determined or assume that it is being exceeded for the purpose of the economic analysis.

Comment: SBSA has a comprehensive effluent monitoring program for metals and organics. Since the inception of the SBSA Pretreatment Program in 1975 and the operation of advanced treatment technology in 1982 there has been a significant reduction in influent and effluent pollutant loading. The more recent Pollution Prevention Program has also contributed to reduced pollutant loading. Even with the substantial reductions achieved in the past there will be severe attainability problems resulting specifically from the adoption of the proposed CTR criteria. Monitoring data from January 1996 through August 1997 shows noncompliance with six (6) metals; copper, lead, mercury, nickel, silver, and zinc. For samples from 1993 to the present there are nine (9) organics and twenty-two (22) pesticides that have proposed objectives below detection limits. There is no mechanism to assess the ability or cost of achieving compliance with these limits.

Response to: CTR-004-002

In recent years, many States have promulgated water quality criteria for various toxic pollutants that are more restrictive than the level of analytical detection. Implementation of these existing water quality criteria by many States do take into account the ability to detect the pollutant in the waste stream. For example, some States determine compliance with limits established below method detection limits (MDL) based on the minimum level (ML), where available. When a promulgated ML is not available, compliance with that limit may be based on the MDL or the practicable quantitation level (PQL).

To ensure that its cost estimates were conservative (i.e., erring on the side of higher costs), EPA used the MDL as the compliance level. Although EPA based compliance determination on the MDL, the Agency acknowledges that estimating treatment costs for WQBELs below the MDL is speculative and likely unrealistic.

However, EPA does believe that aggressive pollutant prevention/waste minimization practices, combined with conventional end-of-pipe treatment, can effectively reduce all detectable amounts of particular pollutants of concern from the discharge, resulting in compliance with WQBELs below detection levels. EPA agrees that some facilities will want to ensure compliance with WQBELs below detection levels through the use of additional or enhanced end-of-pipe treatment. EPA believes that appropriate costswere included in the cost analysis by including costs for both pollution prevention/waste minimization techniques (such as material substitution, process modification, and/or recycling, reuse, or treatment of internal waste streams) and end-of-pipe treatment. Where the pollutant is present at detectable levels, and where the facility implements control measures directed specifically at eliminating these pollutants, the controls will likely result in reduction of the pollutant to below the level of detection. Because there is no evidence that reductions cannot reach a level in compliance with WQBELs, EPA has no reason to believe that its assumption of compliance is not reasonable. EPA compiled two documents, Overview of Pollution Prevention Approaches at POTWs and Pollution Prevention at POTWs, a Resource List (available in the record for this rulemaking), which identify successful programs to reduce mercury and lindane through public education and source controls. See also response to CTR-034-010b.

CROSS REFERENCES

Comment: The CTR Analysis of POTW Compliance with Organics is Based on the Flawed Assumption that Analytical Detection Limits Will Not Improve and thus POTW Plants that Currently Meet the Proposed Organic Effluent because Effluent Monitoring Results are Less than the Detection Limit will Meet the Limits into the Future

A significant number of organic compounds contained in the CTR have detection limits greater than the proposed criteria. For example, endrin and pentachlorophenol are the two cited in the Sunnyvale economic analysis. A significant and potentially costly incorrect assumption of the "Analysis of Potential Costs ... " document was that if all values were reported as below the detection limit, there would be no costs attributable to implementing the CTR. This dismisses a very likely scenario, namely that analytical detection limits will improve over time and that some of these organics may then be detected in the effluent.

If this occurs, POTWs will most likely be facing installation of Granular Activated Carbon (GAC) for low level organics removal, as was recommended for the City of Merced in the CTR Economic Analysis appendix. There are no assurances that the proposed pollution prevention and waste minimization measures would be effective in reducing levels to the extent required. Reverse osmosis (RO) is not extremely effective at removing many of these organics to these low levels so even if Sunnyvale had installed RO for trace metals removal, it would still be facing use of GAC for organics compliance. This would cost approximately $12 million/year for the 29.5 mgd Sunnyvale plant based on the over $4 million/year estimate for the 10 mgd Merced plant.

Comment: Experiments to determine whether a chemical is carcinogenic are performed (on animals) with high concentrations to produce statistically significant results within the time frame of the experiment. The numbers are then extrapolated to determine an estimated "safe" concentration for human populations. All of the factors in the extrapolation process use conservative assumptions (one in a million risk, bioaccumulation potential, carcinogenic potential, etc.) which builds in and multiplies safety

factors. For 39 of the constituents in the CTR, the extrapolated criteria levels are below current levels of detection.

The EPA recognizes this as the proposed rule states: "EPA is aware that the criteria proposed today for some of the priority toxic pollutants are at concentrations less than EPA's current analytical detection limits. Analytical detection limits have never been an acceptable basis for setting water quality criteria since they are not related to actual environmental impacts. The environmental impacts of a pollutant are based on a scientific determination, not a measuring technique that is subject to change. Setting the criteria at levels that reflect adequate protection tends to be a forcing mechanism to improve analytical detection methods. See 1985 Guidelines p. 21. As the methods improve, limits closer to the actual criteria necessary to protect aquatic life and human health become measurable. The Agency does not believe it is appropriate to propose or promulgate criteria that are not sufficiently protective." The rule goes on to add, "the use of detection limits are appropriate for determining compliance with National Pollutant Discharge Elimination System (NPDES) permit limits."

Since the criteria are established on high dosage results that cannot be substantiated at low levels due to statistical significance and inability to see beyond detection limits, the values are predictions. Questions that come to mind are, what would this procedure determine for fat-soluble vitamins A, D and K? In high doses, these vitamins are harmful, though in low dosages, valuable. For constituents below detection, these determinations cannot be scientifically verified by analyses, only mathematically generated based on worst case assumptions. Although caution is warranted when establishing criteria, future unforeseen levels and effects cannot be predicted.

While the EPA believes that compliance determinations are based on detection limits, to assume no cost in the economic analysis for values that are below detection is not a valid assumption. As noted above, the detection limits will be forced to lower levels, and therefore become moving compliance targets without additional economic review should detection's begin to occur.

In summary, the detection levels should serve as the criteria with a "<" designator. The criteria for the affected constituents should be reviewed on a regular basis to reflect current approved analytical techniques, with lower levels promulgated after appropriate economic evaluations.

Comment: 8. EPA should not adopt criteria for any pollutant where the method detection limit exceeds the objective and there is insufficient detectable, reliable data to determine if the pollutant could reasonably be expected to interfere with designated uses. The proposed rule includes criteria for a number of constituents where there is insufficient data to determine whether the discharge of such pollutants could reasonably be expected to interfere with the designated uses. EPA has chosen to promulgate criteria for these constituents even though section 303 (c)(2)(B) of the Clean Water Act requires States to adopt numeric criteria only for constituents "...the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses." Clearly, this "play-it-safe" approach goes beyond the requirements of the Clean Water Act and is therefore unnecessary. By taking this approach, however, EPA is unable to fulfill its duty (under Presidential Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act) to assess the costs, benefits, and impacts of the rule on local government and small entities. While this may be the conservative approach for EPA, it places dischargers throughout the State at risk. As analytical detection limits improve, dischargers may find they are unable to achieve the criteria without costly end-of-pipe controls. But, by then, it will be too late for EPA to evaluate the costs and benefits of the criteria and alternative criteria. For these reasons, EPA must not adopt criteria for those constituents. If EPA does adopt criteria for those constituents, EPA must evaluate the costs and benefits of the criteria, as well as alternative criteria, using worst case assumptions (i.e., assume that discharge levels and ambient levels are at the detection limits). With respect to the District's discharge and Schell Slough and Second Napa Slough, the criteria in this category include, but are not necessarily limited to, the following : benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoroanthene, benzo(k)fluoroanthene, chrysene, dibenzo(a,h)anthracene, aldrin, 4,4'-DDD, 4,4'-DDE, dieldrin, endosulfan I, endosulfan II, endosulfan sulfate, heptachlor, heptachlor epoxide, toxaphene, PCB-1016, OCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, PCB-1260, and hexachlorobenzene (see Table 3).

Comment: 3. Recommend Against Adopting Criteria with Insufficient Detectable Data

The District strongly recommends that the EPA not adopt criteria where the method detection limit exceeds the objective and there is insufficient detectable, reliable data to determine if the pollutant could reasonably be expected to interfere with designated uses. The proposed rule includes criteria for a number of constituents where there is insufficient data to determine whether the discharge of such

pollutants could reasonably be expected to interfere with the designated uses. EPA has chosen to promulgate criteria for these constituents even though section 303 c(2)(B) of the Clean Water Act requires States to adopt numeric criteria only for constituents "...the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses." EPA has chosen a "safe approach" which clearly goes beyond the Clean Water Act and is clearly unnecessary. This approach does not allow EPA to fulfill its duty (under Presidential Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act) to assess the costs, benefits, and impacts of the rule on local government and small entities. While this may be the safe approach for EPA, it places dischargers throughout the State at risk.

As analytical detection limits improve, dischargers may find they are unable to achieve the criteria without costly end-of-pipe controls. But, by then, it will be too late for EPA to evaluate the costs and benefits of the criteria and alternative criteria. For these reasons, EPA should not adopt criteria for those constituents. If EPA does adopt these criteria, EPA should, prior to that, evaluate the costs and benefits of the criteria, as well as alternative criteria, using worst case assumptions (i.e., assume that discharge and ambient levels are at the detection limits). The criteria in this category include the following: Aldrin, Alpha-BHC, Beta-BHC, Chlordane, 4,4'-DDD, 4,4'-DDT, 4,4'-DDE, Dieldrin, Endosulfan I, Endosulfan II, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, Toxaphene, PCB- 1016, PCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, PCB-1260, Hexachlorobenzene, N-Nitrosodipropylamine, Pentachlorophenol, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoroanthene, Benzo(k)fluoroanthene, Chrysene, Dibenzo(a,h)anthracene, and Indeno(1,2,3-cd)pyrene.

Comment: 5. Concerns Regarding Economic Analysis

The District also has several significant concerns with the Economic Analysis that was performed for the proposed rule. Concerns about the cost estimates made for both the District and the state are presented here. (See attached Review of EPA's Economic Analysis of the Proposed California Water Quality Toxics Rule.) Overall, the District believes that problems with the Economic Analysis are serious enough that is should be redone. As stated above in our analysis of assumed costs at the SRWTP, the use of questionable data without qualification combined with unsubstantiated assumptions regarding costs to achieve compliance resulted in a gross underestimate in the cost-effectiveness ratio. The District's first

concern is that if the types of problems found in our Case Study are widespread in other studies, the complete analysis is suspect.

In addition to the analysis of the District's facilities, there are several other points which have been used by EPA to lead to a potentially serious understatement of actual costs. The key assumptions involved are that: 1) no costs would occur if either no monitoring data presently exists or if that data is below analytical detection levels; 2) no treatment costs would occur whenever EPA's initial estimates showed high costs, due to successful regulatory relief; 3) no costs are included for nonpoint sources such as municipal stormwater management systems; and 4) no costs are included for indirect dischargers to the District's system that are not large enough to be considered a Significant Industrial User (SIU).

Regarding the first assumption, the District has found that there is pressure from many sides, including the Safe Drinking Water Act, to both increase the number of constituents being monitored and to lower detection levels to meet numeric criteria set by EPA and the state. To assume that monitoring of these new constituents will not lead to any treatment cost increases is simply unrealistic. Similarly, the second assumption about absolute success in every pursuit of regulatory relief is also overly optimistic. There are no guarantees that pursuit of regulatory relief will be successful in any situation, and EPA indicates elsewhere in the preamble that options such as variances and site-specific criteria will rarely, if ever, be granted.

The third and fourth key assumptions ignore present dominating trends and facts, i.e. that. prevention and control of pollutants at their sources, including very small indirect dischargers, storm runoff, and other nonpoint sources are now the major focus of EPA's wastewater programs nationally. While we agree that these management steps should be taken, there will be significant costs attached to the implementation of these steps that cannot be ignored.

Combined with concerns the District has heard from other sources such as the California Association of Sanitation Agencies (CASA), it appears that EPA has failed to make "a reasoned determination that the benefits of the intended regulation justify its costs." Therefore the District believes that the Agency is obligated to redo the draft Economic Analysis.

Response to: CTR-041-010a

See responses to CTR-032-004, CTR-021-006b, CTR-040-037, and CTR-003-011.

If pressure from the Safe Drinking Water Act results in increases in monitoring of constituents or lowering of detection levels, any associated costs should not be attributed to this rule but would be attributed to actions taken under drinking water regulations. To account for those costs under this rule would be double counting because a cost analysis of drinking water rules would already have accounted for those costs. From the outset of the national water quality standards program, EPA has explained that while economic factors may be considered in designating uses, scientific and technical factors must justify the criteria to meet those uses. Additionally, with regard to benefits justifying costs, Executive Order 12866 states in section 1(b) that this is limited "to the extent permitted by law and where applicable." See also response to 042-007a.

Comment: Several criteria are below current analytical detection. It was therefore not possible to conduct cost-benefit analyses or determine that any set of control measures would or could lead to compliance.

Response to: CTR-045-011

EPA acknowledges the limitations of detection levels for certain bioaccumulative pollutants. However, indirect dischargers to municipal treatment plants often have detectable levels of these pollutants. Similarly, within industrial plants, discharges are often detectable prior to treatment. Once detectable sources are identified, mass balance methods can be used to determine if the facility is discharging at concentrations that exceed instream water quality standards. Fish tissue concentrations can also be used as an indicator that discharges may be causing an exceedance of standards.

Comment: The areas with which we find concerns and the requested changes include the following:

A further problem with the analysis relates to the establishment of criteria that are below analytical detection. Our District finds 34 separate criteria that fall into this category. Lacking this credible data, it was not possible to conduct cost-benefit analyses or determine that any set of control measures would or could lead to compliance. This fundamental inability to utilize established rulemaking procedures mandates further work prior to the promulgation of the criteria.

Comment: * In addition, EPA cannot make an accurate determination of the costs and benefits of promulgating CTR criteria for those criteria that are below achievable detection limits. Because detection limits for some pollutants will most likely improve in the near future, dischargers who are reporting regulatory compliance with current detection limits may not be in compliance when lower detection limits are achievable. OVSD (and likely other dischargers as well) have historically been required to report pollutant results with little regard to the detection limit achieved by the contract laboratory conducting the testing. This may have led to EPA's grossly under estimating the cost impact of the CTR. Detection limits of many priority pollutants identified in the CTR are actually lower than those achieved during recent special testing of OVSD's effluent to identify low pollutant levels. Therefore, the potential compliance costs to our commercial and residential dischargers could be significant, yet the Economic Analysis for the draft CTR could not estimate such costs. As a more reasonable alternative, OVSD recommends that a watershed approach be used to address these pollutants. OVSD's receiving water (the Ventura River) is currently managed using the watershed approach.

Response to: CTR-067-004a

EPA recognizes that regulation of point source discharges alone cannot address all existing or future environmental problems from pollutants in inland surface waters, enclosed bays, and estuaries in California. For example, in addition to discharges from point sources, toxic pollutants are also potentially contributed from other sources such as industrial and municipal emissions to the air, resuspension of pollutants from contaminated sediments, urban and agricultural runoff, hazardous waste and Superfund sites, municipal landfills, and spills. Restoration and maintenance of a healthy ecosystem will require significant efforts in many of these areas.

EPA believes that in certain parts of California, nonpoint sources and other diffuse sources of pollution are responsible for significant amounts of the loadings of some pollutants of concern. Where such continuing contribution of toxic pollutants by these sources occurs, increased controls by point sources may not lead to cost-effective environmental improvement.

EPA encourages all States and Tribes to implement water quality protection programs on a watershed basis. EPA's Watershed Protection Approach is based on the assumption that water quality and ecosystem problems are most efficiently managed at the watershed level rather than an individual water body or discharger level. However, the decision to regulate at the watershed level rests with the State and will be dependent upon many site-specific factors applicable to the watershed (e.g., number andtypes of pollutant sources).

EPA also recommends that States and Tribes establish total maximum daily loads (TMDLs) when dealing with difficult environmental problems, for example, persistent, ubiquitous pollutants and water quality impacts resulting in large part from nonpoint sources and lack of data and scientific uncertainty. Wasteload and load allocations recommended by a TMDL may be based on a reasonable expectation that

water quality standards will be met in a reasonable period of time after appropriate controls are put in place. When there is a reasonable expectation that standards will be achieved in a reasonable period of time, TMDLs may schedule implementation activities, including collecting performance data, that would result in a more cost-effective control strategy and lower costs than the methodology used to estimate compliance costs for the CTR.

Comment: Other impacts Significant impacts may also result from dramatic reductions in discharge limits for PAH'S. Calculated discharge limits for SASM are an order of magnitude lower than the detection limits currently used for SASM effluent.

Response to: CTR-070-003

While it is true that SASM's estimates indicate significant required loading reductions (86% to 91%) based on current and projected effluent limits, the maximum effluent concentration is below detection levels indicating that the pollutants have never been detected. SASM does not provide detailed effluent data or describe existing treatment processes, thus EPA cannot estimate CTR-based limits for this facility nor assess whether additional treatment is required or pollution prevention or process optimization would be sufficient to ensure compliance with CTR-based limits. Because the pollutants have never been detected, EPA would most likely estimate zero costs under its low scenario and, under its high scenario, would probably include costs for pollution prevention or process optimization (depending on the facts relevant for the particular facility) for these pollutants as a result of the CTR.

Comment: OnSeptember 17, I attended a hearing on the proposed CTR at the EPA's regional office in San Francisco. Here are some key issues from the testimony at that hearing:

* Some of the limits are below normal detection limits, therefore agencies have no background data in order to perform accurate attainability analysis.

* The cost of implementation by the EPA is grossly underestimated. The economic analysis shows at maximum implementation cost of $87 million. If preliminary estimates by publicly owned treatment works (POTW) art correct, implementation of the CTR will far exceed the $100 million provision of the Porter-Cologne Act. If this is the case, feasibility of implementation will be in jeopardy. The City of Merced, CA estimates that their additional cost would be $4 million annually. Merced has a very small treatment facility.

* Robert Reid, speaking on behalf of California Association of Sanitation Agencies(CASA), said that four San Francisco Plants estimate their total implementation costs to be $160 million annually.

* Charles Batts of Bay Area Dischargers Authority (BADA) estimated five BADA POTWs costs to be $12 million per year to meet the strict limit on copper and $56 million per year to meet the organics limit.

* The Regional Water Quality Control Board testified that San Francisco discharges twenty percent of the four percent discharged into the San Francisco Bay by POTWS, noting that POTWs are only a minor part of the volume discharged into the Bay. Thus, the reduction to the prescribed limits would cause a negligible decrease in the total mass of pollutants discharged.

* The City of Sacramento projects a $200 million annual cost will be required to meet the copper limit.

All of the testimony at the hearing echoed these concerns. I am sure that you have access to a transcript. The Clean Water Act has been and is instrumental in cleaning up our rivers, lakes, bay and estuaries. We can continue on this steady path by setting gradual attainable limits and through increased public education. Limits on pollutants should continue to get stricter, but this has to occur on a gradual curve that will not place an unreasonable burden on the individual taxpayer.

Comment: Another point we would like to make with respect to the economic analysis deals with the fact that this analysis ignores a potential cause related to compliance for criteria that are being set at below-method detection limits. Again, using Tillman as a case study, the limit on lindane was specified at 19 parts per trillion in the Inland Surface Water Plan. And at the time of promulgation of ISWP, no lindane was detected in the Tillman effluent. However, soon after the new permit was issued, better analytical methods for lindane became available, and subsequently we found Tillman to be consistently in non-compliance. Since that time, Tillman has had lindane concentrations of around 30 parts or so in excess of the permit limit of 19, and the cost for lindane compliance was an unexpected factor that we were forced to address because of better detection limits of lindane, not because Inland Surface Water Plan did not address the issue.

So I think on -- on the other hand that, you know, we can say that no economic analysis could be or need to be performed when the only data available are non-detects. But this issue is real and we are experiencing that. EPA minimally must provide a mechanism to incorporate this scenario into the economic process as they occur.

Comment: MS. FRANKEL: I have just one question. If I could ask you -- I missed the first thing that you had mentioned. You said that you were putting in some treatment to comply with the existing permit?

DR. CHENG: In the case of lindane, we would have to go to really drastic measures. And no, we have not. We are still in noncompliance. And while we were contemplating on project to deal with the lindane case back in 1994, that was about the time that Inland Surface Water Plan was rescinded, and therefore we were basically taking the approach "wait and see what happens" without spending hundreds of millions of dollars. I think -- I believe the figure was $200 million to go through our own whatever necessary to remove lindane.

I might as well mention, at that time methylene chloride is a similar case. But the City in good faith effort pursue all avenues, and actually we were able to bring the methylene chloride issue to compliance through very aggressive retreatment program. So we're very proud of that, and that supports the EPA's program in source control and a lot of other things.

But we believe, in our case, that the case of lindane, we have exhausted all of the industrial potential dischargers and it comes to perhaps home use, head lice treatment, doing shampoo, that type of thing. And since 1992 we have entertained request with state consumer product affair regulations to see if they could do something about it. But these are the type of things that are beyond our capabilities other than putting in real expensive treatment. And I hope you understand why we are so concerned with the detection limits and making the need to be provided as these things will occur because scientists are going to make progress and we're going to find where we didn't think there was a problem.

MR. MORRIS: The other comment you made is that the cost when the limit is below the quantitation level - -

DR. CHENG: Yes.

MR. MORRIS: -- and the analysis does to a certain extent look at those types of costs. In the high-end scenario, it is a limit-to-limit analysis. So if you look at the WQBEL for PCBS, let's say, the typical WQBEL for PCBs is the quantitation level; the WQBEL for the CTR will be below the quantitation level. In those, if there was a difference between those two limits which are below the quantitation level, we would cost the treatment to give the current statement to ours. So there is an element in there that deals with WQBELs below quantitation.

We've done similar type analysis for other rule-making; but you've got to understand that, when you do those, they're highly speculative because a lot of times you don't really know if it's there or not. And when we do these types of regulations in other parts of the country, a lot of times the dischargers and the municipalities say the same thing. We've all got this pollutant. You can't quite see it because it's right below the detection level.

What we've done in the past when we go out in the field and try to find these pollutants, they don't really exist. So I guess what I'm saying to do is that when we spend a lot of money going out to try to identify whether or not you have it, the likelihood is it's like mercury which is fairly ubiquitous. What we're finding is they're down under a part per billion for dischargers.

DR. CHENG: Thank you. I understand what you're saying and I highly respect your economic analysis because I'm an economist. However, maybe I have not made the case real clear.

The case about lindane is real clear. Back in 1991, I believe our detection limit was about 200 parts per trillion. Nobody had detected anything using the bestmethod. Criteria was set at 19 for the highest WP, but it's just such a coincidence that my labs were getting better, using capillary pollens and all these other things, and better control of even the gas chromatograph injection techniques; but now we go below 19 and all of a sudden we found out that we are about 30. It's real. It's generating permit violations every month just about. So I can recall only maybe a handful of months throughout the six- or seven-year period that we were not exceeding the 19.

So while I can appreciate that there are case histories where it's just a big worry that the sky might fall, in this case the sky has fallen. And so I would like to just make it clear that I have not gone through your analysis to fully understand about WQBEL and how you do it, but perhaps one practitioner's point of view, the cost that we assess to comply with lindane, for example, is in the hundreds of million of dollars, and because the only technology based on what we know was based on something like reverse osmosis, is that something that through the economic analysis will be washed out?

MR. MORRIS: If in our analysis we have a permit limit for that pollutant and the state's permit limit and you're violating that limit, we would not take the hit for you getting into compliance with your current state permit limit.

DR. CHENG: I understand EPA's approach and EPA's policy. However, it does behoove us to recognize that it is an unfair situation. The legal basis for Inland Surface Water Plan is not there. And can we not -- Looking at the books I see it.

MR. MORRIS: I think that in your particular case, if you truly have this problem and you're truly looking at the kind of economic impacts that you say you're going to RO, or whatever you need to get to this limit, I would apply for a variance. I would continue to aggressively implement and apply for a variance and lay the facts on the table and, let's say, look at them, make a decision. But I think that requires going public, putting the data on the table, showing them what you've done, showing that its -- you can't find the source, it's ubiquitous, and there is no way you can take it out other than going to plant treatment. But the public has to review the facts and make a decision.

DR. CHENG: I appreciate very much your suggestion indeed, since the City of L.A. has been basically trying its best to address all pollution concerns. We are confident that it is -- We are concerned that it's got to be addressed one way or another.

Response to: CTRH-002-022

See responses to CTR-045-011, CTR-032-004, CTR-060-019, CTR-040-026, and CTR-035-064.

EPA agrees that benefits are likely to be highly site specific. However, sites likely to experience a disproportionate share of the benefits are also likely to incur a disproportionate share of the costs.

In addition, once water quality standards are in place, sites that are currently less impacted by toxic pollutants may experience cost savings by preventing future cleanup costs. That is, it may be more cost-effective to prevent toxic pollutants from entering surface waters than to clean up and remediate the impacts once toxic pollutants are released. However, should the State determine through a total maximum daily load (TMDL) allocation that controls on nonpoint sources are a more cost-effective approach to achieving standards, the State can redistribute the allocations through the TMDL process.

The range of estimated benefits in part reflects the range in loadings reductions that may result from point source controls given the flexibility in State implementation procedures. The decision as to which implementation procedures will be employed, and therefore what costs and benefits will result, will be made by state and local entities for specific locations.

Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that if monitoring data was available but all values were reported as below analytical detection levels, that the discharger will not incur costs as a result of the CTR.

Response to: CTR-040-028

If a discharger had no effluent data, EPA did not automatically assume that the discharger would have no costs as a result of the CTR. When effluent data was available, however, EPA used the method in EPA's Technical Support Document for Water Quality-based Toxics Control (1991) to determine reasonable potential and then followed the methodology (i.e., the cost-decision matrix) described in the Economic Analysis (EA) of the final CTR to estimate costs. In the abscence of data under the high scenario, reasonable potential was assumed if the discharger had an existing permit limit for a pollutant and EPA then estimated costs using the methodology described in the EA. See also response to CTR-003-011.

Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that if monitoring data was available but all values were reported as below analytical detection levels, that the discharger will not incur costs as a result of the CTR.

Comment: 10) In general we were impressed by the level of effort used in the economic analysis. However the paucity of data at levels sensitive enough to characterize the compliance status of the waters and the underlying assumptions used in their place, completely overshadowed it's finer points. For example, the use of zero for the ambient receiving water background concentration in the absence of reported numbers is not appropriate for chemicals typically found in the environment but may be appropriate for exotic chemicals if their use is non-existent in the area. Given the extremes in potential costs involved here, it would have been appropriate to run the analysis once under the assumption that it is zero and again assuming that it equals the detection level for that chemical.

Response to: CTR-003-010

For analysis of the final CTR, EPA collected the most recent publicly available data and information for each of the sample facilities including permits fact sheets, permit applications and monitoring data. Data submitted as a part of the public comments were also reviewed and considered. However, because only four of the sample facilities are allowed dilution, EPA applied the CTR criteria directly as effluent limits for most of the sample facilities (i.e., since no dilution was provided, background data did not affect the stringency of the effluent limit).

Comment: pp. 5-1 - 5-2 (U.S. EPA, 1997b) -- Analysis of 10E-5 Risk Level for Carcinogens We disagree with EPA's conclusion that "the changes in estimated costs and pollutant load reductions based on the lower risk level of 10E-5 are minimal." In fact, under the low cost scenario, the analysis shows that there would be >25 percent cost savings, with only a 3 percent lowering in pollutant reductions. We believe that analysis demonstrates that it is probably cost-effective to lower the risk level for carcinogens. However, given the equivocal results for the high cost scenario, we recommend that EPA re-analyze the impacts of modifying the risk level, and look not only at the attainability and cost analysis, but analyze the actual change in risk levels that would result, given the uncertainty factors that are built into the criteria. Based on all of the conservative assumptions included in the calculation of the criteria, there is significant uncertainty in the numbers, which may translate to negligible risk from using lower risk levels. EPA should factor this uncertainty into the risk assessment, along with population exposure, when evaluating risk levels for the human health criteria.

Comment: Introduction

On behalf of CASA and Tri-TAC, M.Cubed reviewed the U.S. Environmental Protection Agency 's (USEPA) Economic Analysis (Analysis), as well as the report's underlying benefit and cost data and analyses. M.Cubed's overall reaction is that policy makers and the regulated community can place little

confidence in either the benefit or cost analyses -- the uncertainties and broad assumptions contained in these analyses largely undermines their findings. Based on the information provided by USEPA, M.Cubed's judgement is that the proposed California Toxics Rule (Rule) will result in multi-million dollar annual costs -- and have substantial impacts on individual publicly-owned treatment works (POTWS) and dischargers -- and may result in no noticeable benefits to public health or the environment. A critique of specific weaknesses in the cost and benefit analyses is provided below.

Weaknesses in Overall Report Findings

The Analysis' overall findings exhibit a number of flaws, as follows:

USEPA's estimates indicate that Rule costs outweigh benefits, both on an annualized and present value basis. USEPA's claim that comparison "...of both annualized benefits and costs and discounted benefits and costs indicates that the monetized benefits of the CTR are of the same general magnitude as the costs" is simply not true (U.S. EPA, 1997a, page 9-2). For example, using USEPA's comparison of a twenty-year phase-in of benefits at a 3 percent discount rate against a ten-year phase-in of costs at a 7 percent discount rate, or benefits of between approximately $20 to $600 million against costs of about $180 million to $1 billion (setting aside the significant weaknesses in the analysis; differences in the probabilities of low or high outcomes; and questions over the appropriate discount rate to apply)(*2) indicates a low cost scenario which is nine times higher than the estimated benefits, and a high cost scenario which is almost twice as high as benefits.(*3)

Executive Order 12866, which requires the economic review, defines "significant regulatory action" as one that is likely to "adversely affect ... a sector of the economy." Yet, although the USEPA finds that two sectors will incur the majority of the regulatory costs -POTWs and chemical/petroleum products -- it provides no analysis of whether or not these costs are "significant" to these sectors. Likewise, USEPA does not examine the potential costs or their implications to small businesses (e.g., health care providers; automobile repair shops), small communities, or non-significant industrial users (SIUs) in general (i.e., industries that are regulated by POTWs through local ordinances, rather than under federal rules)

USEPA's conclusion that the use of different risk levels would not significantly influencecompliance costs is not supported by its data. Based on USEPA's own data, use of a 10E-5 risk level for carcinogens would induce a 25 percent cost savings relative to a 10E-6 risk level under the low cost scenario, with a 3 percent change in pollutant loadings.(*4)

(*2) Noticeable benefits seem unlikely to emerge in the near term, if at all, due to the persistence of existing contaminants in the environment, while costs will be incur-red over one to two decades. Use of a lower discount rate for benefits would reflect the greater value future generations may place on environmental amenities, an assumption which is open to debate.

(*3) The large differences between benefits and costs is mirrored by the wide range in estimated pollution reduction. Under USEPA's low scenario, only.63 million toxic pounds- equivalent are expected to be reduced under the rule, compared to a high scenario reduction of 7 million pounds equivalent. That is, reductions under the high scenario are eleven times higher than under the low scenario.

(*4) Under the high cost scenario cost reductions are less than I percent, with a 7 percent change in pollutant loadings.

Comment: C. RECOMMENDATIONS FOR MODIFICATIONS TO THE CTR AND EA

Specify carcinogenicity risk factor of 10E-5 . EPA should acknowledge that a significant portion of the attainability, cost, and benefit issues can be addressed by the simple modification of the carcinogenicity risk factor. EPA should clearly state that the criteria are based on a risk factor of 10E-5, and strongly urge its use by the State in its Implementation Plan. As noted in the analysis by Larry Walker Associates, Authority and BADA attainability and cost issues are essentially resolved if the criteria are based on a risk factor of 10E-5. In addition, existing permit limits and high level of compliance remain in place.

Comment: Industrial source control and pollution prevention activities cannot be relied on to achieve the reductions that may be needed. The Sources of Pollutants of Concern and Waste Minimization Plan study, conducted by SBSA in 1992, identified that most of the pollutants of concern are not from industrial or commercial users. Complete elimination of industrial and commercial discharges would not resolve the compliance problems. The conceptual cost estimate for metals and organics removal treatment (reverse osmosis) technology at SBSA is around $18 million dollars per year.

Response to: CTR-004-003

EPA agrees that pollution prevention may not be applicable or effective in all circumstances. Before estimating costs for the final Great Lakes Water Quality Guidance, which was used as the basis of pollution prevention cost estimates for the CTR, EPA attempted to collect additional data related to the cost and effectiveness of pollution prevention techniques for the pollutants being regulated under the final Guidance. The result of these efforts, which generally constituted an extensive review of the EPA Pollution Prevention Information Clearinghouse (PPIC), indicated that limited documentation was available regarding the effectiveness of pollution prevention to remove many of the pollutants included in the CTR. The limited information did, however, suggest that facilities could eliminate toxic constituents from their operations using pollution prevention techniques such as raw materials substitution and process modifications (EPA, 1992; EPA, 1994).

In estimating costs for the CTR, EPA used a decision matrix for purposes of estimating the types of controls and costs associated with these controls to avoid unjustified use of waste minimization/pollution prevention techniques to achieve CTR water quality-based effluent limits (WQBELs). Under the decision matrix, waste minimization/pollution prevention was considered only after consideration of modifying existing treatment systems to achieve CTR-based WQBELs. Further, waste minimization/pollution prevention controls were considered when the production process or source generating the pollutant was amenable to pollution prevention techniques, and when addition of treatment was not justifiable. Three cases where EPA assumed that the addition of treatment would not be justified are detailed below.

1. Existing discharge data indicate that the pollutant is most often in compliance with projected CTR-based effluent limits. The reported maximum effluent concentration or existing permit limit does not reflect standard discharge levels. For instance, treatment costs were not assigned to pollutants reported above detection levels only once in three years. A pollutant was considered most often in compliance with projected limits if sufficient data were available and approximately 80% or more of the observations were already in compliance with the projected permit limit.

2. Discharge monitoring data are inconclusive to assume treatment costs. It was assumed that a facility would not add treatment without having sound proof that it was needed. Treatment was not selected if discharge monitoring data were not available or very limited (i.e., 1 or 2 data points), discharge data were not recent (i.e., previous to 1993) or did not reflect existing operating conditions, in particular when operating practices described in a recently re-issued permit indicated the decrease in the discharge of pollutants.

3. The pollutant loading reduction is insignificant in terms of percentage load reduction (i.e., 10-25%).

As an alternative to the use of waste minimization/pollution prevention, EPA also considered the use of the flexibility provided through the National water quality standards and NPDES programs (i.e., alternative regulatory approaches such as phased total maximum daily loads/water quality assessments, site-specific criteria modifications, standards variances, metals translators, etc.) as a control alternative in estimating costs for the CTR. However, the use of alternative regulatory approaches was limited to only those facilities under the low-end scenario where the estimated cost was disproportionately high as compared to the resulting estimated pollutant reduction.

Comment: The CTR Incorrectly Extrapolates Assumptions Regarding the Effectiveness of the City's Source Control Program Regarding Metals Control Measures that Leads to Erroneous Conclusions Regarding Compliance with Projected CTR Effluent Limits

CTR Appendix I-B-1 1 refers to Sunnyvale's 1994 Local Limits Compliance Strategy report relative to an alternative analysis of copper compliance. The appendix asserts thatimplementation of the City's recommended pollution prevention and source control activities "is believed to be sufficient to the 4.9 ug/L limit" and that costs to achieve a 5.5 ug/L CTR limit would range from $400,000 to $2,000,000. The City's reports do not support this conclusion, but rather indicate that the WPCP would probably not attain the limits. It is important to note that since the 1994 report, the City has fully implemented the copper control measures recommended in that report and the effluent quality is above the 4.9 or 5.5 ug/l

level 30-40% of the time. As described elsewhere in this memo, the CTR authors continue to confuse compliance with a non-existent monthly average limit with the actual daily maximum limit which cannot be exceeded on any day.

The majority of copper now entering the treatment plant is from the local water supply, from corrosion of residential copper plumbing. This is not a source that is under the control of the City although the City has worked with the water purveyors to help optimize their corrosion control efforts. This CTR appendix needs to be corrected to reflect Sunnyvale has implemented the "reasonable control measures" and there is no basis for assuming that further pollution control measures will achieve copper compliance.

Response to: CTR-021-012

EPA's revised Economic Analysis of the CTR does not include the alternative analysis for copper compliance that was presented in the draft version (Appendix I-B-1 of the Technical Support Documentdated May 5, 1997). Therefore, Sunnyvale's comments regarding the feasibility of this cost estimate are no longer applicable. In it's revised cost analysis, EPA used dissolved water quality criteria for copper and assumed that the criteria would be implemented using metals translators (EPA used a site specific translator of 2.6 for copper). Effluent quality data for copper indicate that the facility is in compliance with CTR criteria (only one effluent data point collected between 1995 and 1997 was above the CTR-based limit). Thus, EPA concluded that a pollution prevention program was sufficient to ensure compliance with the CTR-based limit and estimated costs for this program.

In addition, Sunnyvale asserted that EPA confused compliance with a nonexistent monthly average limit with the actual daily maximum limit. The methodology EPA used to derive permit limits for the draft and final economic analyses of the CTR establishes that for each pollutant assumed to have reasonable potential, a maximum daily limit and an average monthly limit are calculated. This is a standard NPDES permitting requirement and is detailed in the Technical Support Document for Water Quality-based Toxics Control (U.S. EPA, 1991). For the final Economic Analysis, EPA used the average monthly limit as the projected CTR-based limit because it is the most stringent limitation imposed on this facility. EPA estimated pollution control costs based on individual violations of the average monthly limit, as if the average monthly limit was a maximum daily limit. As a result of these assumptions, EPA's estimates are more conservative than those based on maximum daily limits.

EPA recommends referring to Box 5-2, "Calculating Permit Limits Based on Two-Value Wasteload Allocation," (page 100) of the Technical Support Document for Water Quality-based Toxics Control, for a step by step explanation of EPA's methodology.

Comment: Weaknessesin Cost Analysis The report's cost estimates exhibit a number of significant weaknesses, as follows:

* The Analysis assumes a very loose and highly effective trigger for use of low-cost waste minimization/pollution prevention techniques. USEPA asserts that 10 to 25 percent reductions in current discharge levels is "insignificant," and would be fully addressed by low-cost waste reduction strategies.(*10) Little data is provided to support this assertion. Individual POTWs and dischargers may already be implementing all feasible low cost techniques; or these techniques may be insufficient to obtain the necessary reductions. As indicated by USEPA itself, "...without process-specific information, it is unknown if waste minimization is technically feasible." (U.S. EPA, 1997b, page 2-33).

(*10) It is equally plausible that it will be extremely expensive to obtain an additional one to ten pounds per day of reductions, such as may be required in the City of San Jose.

Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that if a constituent only occasionally exceeds a calculated effluent limit,that the effluent limit can be achieved through source control even if the required reduction is on the order of 90% to 99% (as was done in the analysis of mercury and aldrin for the Sacramento POTW case study).

Response to: CTR-040-030

The results of the final CTR cost analysis indicate that aldrin is no longer a pollutant of concern for the Sacramento POTW. These results support the draft analysis in that no major costs should be associated with aldrin removal. No reasonable potential to exceed was concluded because no permit limit exists for aldrin and because the constituent was recorded consistently below detection levels during the last three years of monitoring (twenty-one observations).

Mercury criteria are 0.05 ug/l for freshwater and 0.05 ug/l for saltwater. In analysis of the final CTR, the required reduction for mercury is 72%. EPA still assumes that pollution prevention/waste minimization will be sufficient to comply with CTR limits. Forty-nine observations were made at the discharge from 1994 to 1997, and only three observations were recorded slightly above the proposed CTR limit. Since the facility is capable of complying with the proposed limit 95% of the time, EPA expects that the facility would find more cost-effective methods to comply with the CTR limit, and not incur the expense of adding treatment process units. Comment: Although EPA goes to great length to label its cost analysis as "conservative" the analysis is anything but conservative:

* It is not conservative to assume that POTWs can achieve a 25% reduction through source control and an additional 25% reduction through treatment plant optimization.

Response to: CTR-040-029a

EPA acknowledges that the effectiveness of source controls and process optimization techniques will vary from facility-to-facility, and will depend upon many factors, including for example, the volume of discharge, the type of manufacturing process used, and the inputs to the production process. However, EPA believes that, on average, assuming that reductions of less than 25% can be controlled by the use of source controls or process optimization is reasonable. EPA considered minor, low-cost modifications or adjustments of existing treatment feasible if the literature indicated that the existing treatment process could achieve the revised WQBEL and if the additional pollutant reduction was relatively small (e.g., 10% to 25% of current discharge levels). EPA assumes that prior to incurring capital expenditures, most facilities will evaluate low-cost alternatives for pollutant reduction.

It should be noted that in the analysis of costs for the Economic Analysis for the final CTR, EPA performed a literature search to verify the costs associated with treatment process optimization. As a result of this effort, EPA revised upward its estimate of process optimization costs to a range of $60,000 to $233,000 depending upon the general type of treatment processes being used at a facility and the volume of discharge. These estimates include costs for performing a process optimization study, as well as process modifications.

Comment: The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule (see Attachment 3). The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. BADA's analysis shows that its member agencies alone could be faced with costs in excess of $100 million per year to achieve effluent limits based on the copper, PAH, heptachlor and aldrin criteria. BADA's analysis also indicates that the benefits associated with this expenditure will be difficult to measure. Copper loadings will be reduced by 1% and the level of compliance for PAH's and heptachlor will remain unchanged at its present high level. Certainly these benefits will not measurably improve the fishing experience or measure the number of fisherman in the Bay, significantly reduce the cancer cases, or improve property values or other nonuse benefits, as estimated in EPA's economic analysis. A further consequence of the flawed economic analysis is the conclusion that the CTR is not a major rule (i.e., one which will result in excess of $100 million per year expenditure) subject to Presidential Executive order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Reform Act. BADA agencies provide service to a number of small communities with populations under 50,000 people that could be greatly impacted by the proposed rule.

Comment: Second, the interaction between the CTR and the state's implementation policy is particularly important given our second concern, which is namely that the EPA's economic evaluation underestimates the costs and overestimates the benefits of implementing this rule.

Our concern about the cost estimates is based on the fact that the cost analysis appears to undervalue the magnitude of difficulty dischargers will have complying with permits issued based on this rule.

We are also concerned that the cost estimates for various compliance activities such as source control and treatment process optimization made in the case studies are overly optimistic and not reflective of the true actions that will need to be taken to insure compliance.

Overall, we are concerned that the expenditures that may be necessary for many POTWS to comply with the CTR will be large, these costs may not be matched by commensurate benefits, and that EPA has not analyzed whether point source controls are in fact a cost-effective way to achieve water quality standards.

Our preliminary analysis for just five agencies in the Bay Area to comply with the proposed standard for copper alone could amount to more than $60 million per year -- 60 million. This number would be far higher if calculated for every pollutant listed in the CTR for the entire POTW industry in California.

Since this estimate would undoubtedly exceed the high end of the range contained in EPA's analysis, we believe it is necessary for EPA to redo the economic analysis to fully comply with its legal responsibilities.

In addition, revised economic analysis is necessary to provide a sound basis for the State to use in its analysis of the economic impacts of the implementation policy.

Comment: Weaknesses in Cost Analysis The report's cost estimates exhibit a number of significant weaknesses, as follows:

* USEPA's use of averages to estimate individual POTW costs may mask significant expense variations. For example, some facilities may experience the great majority of total costs, while others may face less significant expenses. Likewise, the Analysis does not address costs associated with maintaining reliable water quality levels in the face of time or weather-related variations in discharges, such as peak loading.

Comment: The City does not agree with the economic analysis. It is incomplete and misrepresents the actual costs and benefits. The analysis does not include costs of expensive AWT to meet more stringent limits based upon the proposed criteria. It does not include the first second, and third order costs to the community, individuals and businesses, of the economic dislocations resulting from huge capital costs, especially for small and economically distressed communities, that divert scarce resources from other priorities or out of the area. It does not include cost impact assessments to low and fixed-income households - ignoring the economic aspects of environmental justice. The benefits assessments make vast unsupported assumptions about the benefits of reductions in constituent concentrations that are barely, if even, measurable, and assigns unrealistic contingent valuations to these assumed benefits. The cost analyses does not follow EPA's own economic assessment guidance (which, itself, is fatally flawed). These points were brought up during the Task Force meetings in 1995 and 1996, but were dismissed outright by EPA. The City hereby raises these issues for the formal record.

The City of Thousand Oaks appreciates the opportunity to comment on the proposed California Toxics Rule.

Sincerely,

Donald H. Nelson Public Works Director

Response to: CTR-009-008a

EPA's own economic assessment guidance (Interim Economic Guidance for Water Quality Standards, EPA-823-B-95-002, March 1995) is intended to assist States and applicants in understanding the economic factors that may be considered, and the types of tests that can be used to determine if a designated use cannot be attained, if a variance can be granted, or if degradation of high-quality water is warranted. In order to remove a designated use or obtain a variance, or if degradation of high-quality water is warranted, the state or discharger must demonstrate that attaining the designated use would result in substantial and widespread economic and social impacts. Although EPA is responsible for approving a State's water quality standards, the State is responsible for interpreting the circumstances of each case and determining where there are substantial and widespread economic and social impacts, or where important social and economic development would be precluded.

Estimating the economic impact of the CTR in California requires a detailed econometric model of the region's economy. EPA did not conduct such an analysis of the rule and the Clean Water Act does not

require such a analysis (see CTR-042-007a). However, for a similar toxics rule in the Great Lakes Basin, an econometric analysis was performed independent of the regulatory impact analysis for the Council of Great Lakes Governors (The Great Lakes Water Quality Initiative: Cost Effective Measures to Enhance Environmental Quality and Regional Competitiveness. DRI/McGraw-Hill, San Francisco, California, July 1993). This analysis showed a minimal impact of the rule on the region's economy for a worst case scenario, a scenario with costs far exceeding those estimated by EPA. Manufacturing output was estimated to fall by between 0.008% and 0.337% over a range of four scenarios evaluated, while personal income loss was estimated at between 0.002% and 0.094% for these scenarios. As a result, the study authors concluded that the impact of the rule on the region's economy would be "nearly imperceptible." Thus, similar controls on toxic pollutants have been shown to be affordable in other regions of the country.

EPA agrees that the contingent valuation method (CVM) elicits an individual's stated willingness to pay or accept compensation. The benefit-cost comparisons in EAs are prepared to inform the public and policy makers. Thus, the strengths and weaknesses of all aspects of the EA, including methodologies for estimating benefits, need to be made clear so that readers are aware of the limits and uncertainties. However, a 1993 Blue Ribbon Panel convened by the National Oceanic and Atmospheric Administration (NOAA) evaluated CVM and found it to be an appropriate methodology for measuring values. It is also the only method accepted by the U.S. Department of the Interior (DOI) to estimate nonuse values and has withstood Federal Court review for its use in litigation contexts.

Additionally, much of the criticism of CVM is conceptual rather than based on empirical research. Where CVM can be compared to other research techniques (e.g., use values estimated by the travel cost methodology or the hedonic price method), CVM is shown to yield similar values (see Brookshire et al., 1982 and Smith et al., 1986). Additionally, in several field experiments, actual purchase decisions were compared to hypothetical purchase decisions (Bishop and Heberlein, 1978 and Dickie et al., 1987). In all of these studies, hypothetical behavior was sufficiently predictive of actual behavior that researchers concluded meaningful values could be obtained for benefit-cost analysis or damage assessment.

Bishop, R.C. and T.A. Heberlein. 1978. Measuring values of extra-market goods: Are indirect measures biased? American Journal of Agricultural Economics 61(5): 926-930.

Brookshire, D., M. Thayer, W.D. Schulze, and R. d'Arge. 1982. Valuing public goods: A comparison of the survey and hedonic approaches. American Economic Review 72(1): 165-177.

Comment: And one final point that I would like to make is that the management of the City of Merced is really looking hard at ending our discharge to surface waters because of the uncertainties of how much it

is going to cost in enforcement liability with the California Toxics Rule.

If that would happen, we would be doing a disservice to a thriving ecosystem. And I believe that the economic impact of people having to cease discharges because of the regulations should be taken into account as part the economic analysis.

Thank you.

Comment: Economic Analysis

The District supports CASA/Tri-TAC's conclusions that the Economic Analysis has significant technical weaknesses, is based on a large number of assumptions and minimal empirical data, and that it almost certainly understates costs and overestimates benefits. There is a critical need for a sound economic analysis. We also agree with their recommendation that EPA and the SWRCB undertake a collaborative process with interested members of the public to revise the Economic Analysis based on guidelines in the Economic Considerations Task Force Report.

Comment: * Based on these and other issues discussed in the attachments, we strongly urge EPA to revise its Economic Analysis, and recommend that EPA and the SWRCB work together with stakeholders to craft a revised approach that is mutually acceptable. We would be pleased to assist in such an effort.

Response to: CTR-034-016

EPA has worked very closely with the State to develop the results of the Economic Analysis (EA). The Agency considered all comments and information regarding the EA that accompanied the proposed CTR and revised the EA, as appropriate. In the post proposal process, EPA also met with stakeholders, as

requested, to discuss their concerns regarding the EA and made revisions, where necessary. EPA did not want to alter the EA methodology without another round of public comment which likely would have resulted in enormous additional costs and more delays. This was not justifiable given that the methodology was sound and the criteria are science, and not economically, based.

B Comment Period

Comment: EPA's Economic Analysis is important not only for EPA's rulemaking, but for the SWRCB's promulgation of the State's Implementation Policy. Without significant improvements, we do not believe that EPA's Economic Analysis would comply with the requirements of the state Porter-Cologne Act if used by the SWRCB to support the State Proposal. We propose that EPA and the SWRCB undertake a collaborative process with interested members of the public to revise the Economic Analysis, based on methodologies and assumptions Jointly agreed 91 upon. Such a process was recommended by the Economic Considerations Task Force convened by the SWRCB in 1995, based on the process used in the Bay-Delta process. Guidelines for embarking on a collaborative process were proposed in the Task Force Report (SWRCB, 1995, Section VIII). We believe that this process could result in a mutually acceptable and defensible analysis that both EPA and the SWRCB could use to satisfy their respective rulemaking requirements for economic analysis.

Based on the extensiveness of the modifications we believe EPA should make to both the proposed rule and the accompanying Economic Analysis, we request that EPA re-propose the rule for public review and comment before publishing the CTR as a final rule.

Response to: CTR-035-011a

See responses to CTR-021-004 and CTR-034-016.

The EA is part of a Federal action that is not subject to the requirements of the Porter-Cologne Act. The State, in the development of its Implementation Plan, is solely responsible for compliance with the requirements of the Porter-Cologne Act and other relevant State statutes. EPA is unable to comment on whether or not the State's future actions will withstand potential judicial review. However, EPA stands by its economic analysis as being an appropriate estimate of the costs likely to be incurred by California facilities as a result of implementation of the CTR.

Comment: * In general, we are pleased that EPA prepared an analysis of the economic impacts of the proposed CTR, and that a major portion of EPA's work focused on determining the potential impacts on POTWs. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Detailed comments can be found in Attachment 2. A few of the areas of concern are listed below:

* Small facilities appear to be under represented in EPA's sample of POTWS, especially for minor dischargers.

* The cost triggers used as regulatory relief thresholds are unrealistic, and are not consistent with EPA regulations and policies.

* The assumptions used to determine cost estimates for indirect dischargers appear to omit a large proportion of potentially affected industries.

* The Economic Analysis does not take into account projected population and industrial growth over time, which may influence effluent quality and quantity. Statewide, the population is projected to grow by nearly 50% by 2020.

* The use of average cost estimates masks economic impacts on individual dischargers, which may be particularly acute for small communities.

* The economic Analysis ignores the costs that may be incurred by stormwater dischargers and nonpoint sources to reduce loadings so that CTR criteria may be met in ambient waters.

Comment: Economic Analysis

The Sanitation Districts commends EPA for preparing an analysis of the economic impacts of the proposed CTR, and for selecting POTWs for half of the case studies. We believe that EPA is correct in thinking that POTWs are likely to experience major impacts as a result of the promulgation of the CTR. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Our own attainability and cost analysis indicates that there are indeed fundamental flaws in the cost analysis. A few of the areas of concern are listed below:

* The Economic Analysis does not take into account projected population and industrial growth over time, which may influence effluent quality and quantity. For example, in Los Angeles County the population is projected to grow to nearly 13 million (36%) by 2020.

Comment: Dear Ms. Frankel:

The Novato Sanitary District (District) thanks you for the opportunity to comment on the proposed California Toxics Rule (CTR). Unfortunately, we had insufficient time to analyze all aspects of the rule and the supporting economic analysis. This letter summarizes the comments based on our review to date.

As background, the District has two tertiary treatment plants (each with secondary treatment plus nitrification and filtration) which discharge through a common outfall to the shallow waters of San Pablo Bay. As a shallow water discharger, we are not allowed a dilution credit under the current Basin Plan and receiving water criteria are generally incorporated directly into our permit as effluent limits. The District has a population of approximately 57,000 and is basically residential in nature with supporting commercial development. We have no significant industrial dischargers to our system. We have established an aggressive pollution prevention program targeted primarily at copper (corrosion control and vehicle services control programs), and as a result our effluent copper levels have been reduced significantly (from over 50 ug/l several years ago to generally between 10 and 20 ug/l.

Sampling of residential and commercial discharges to our sewer system has established that influent copper levels are equivalent to residential copper levels and that 87% of the copper loading is attributable to tap water (the result of corrosion of copper pipes). The local water agency has already implemented a corrosion control project. Pursuant to the District's request, the agency has increased the pH beyond that required by the lead and copper rule to achieve maximum potential reduction of corrosivity. Our effluent monitoring has for several years employed clean sampling techniques and appropriate QA/QC. In the case of mercury, for example, we have been using Frontier GeoScience, the recognized expert in mercury analysis.

The District has evaluated low-cost alternatives for improving copper removals at the least efficient of our two treatment plants and concluded that addition of chemicals without significant capital improvements would not be effective. The District has further determined that significantimprovement in copper removals (although far less than needed to achieve compliance) would require capital improvements of $2.8 million and total annual costs of $480,000.

Response to: CTR-005-001

The Navato Sanitary District states that capital improvements of $2.8 million total and annual costs of $480,000 would be required for the District to achieve significant copper removal at one of its wastewater treatment plant facilities. Moreover, the district indicates that this investment will not be

sufficient to achieve compliance levels.

Review of the information submitted by the District is not sufficient to determine if the costs estimated by the District are consistent with the estimates obtained for sample facilities of the same industrial category and flow range. The existing permit limit for copper is not indicated in the documentation submitted by the District. Review of the NPDES Permit issued in 1992, which was to expire in 1997, indicates that a final copper permit limit of 2.9 ug/L was to become effective in April 11, 1996. This limit is more stringent than a limit calculated using CTR criteria for a facility with the characteristics of the Novato Sanitary District. Therefore, if the 1992 final permit limit were used to assess existing (baseline) conditions, it is unlikely that the Novato Sanitary District would show any cost as a result of the CTR.

Additionally, the cost estimates submitted by the District seem to be based on compliance with an estimated permit limit of 2.9 ug/L. These costs are included in the amendment request for the copper effluent limit submitted by the District to the California Regional Water Quality Control Board on January 31, 1996. A CTR-based permit limit for a facility with the characteristics of the Novato Sanitary District facility would use a 3.1 ug/L dissolved criteria for copper. Metal translators could also be used to derive permit limits and, if desired, the facility could complete a water effect ratios study which may result in a less stringent limit. For example, based on studies completed by the Regional Board and the City of San Jose (a San Francisco Bay discharger), water effect ratios for the Bay range between 1.7 and 3. Additionally, a metal translator of 3.2 could be calculated based on the U.S. EPA theoretical partitioning coefficient and an assumed total suspended solids (TSS) concentration of 20 mg/L. The resulting permit using CTR criteria and accepted implementation procedures would result in a limit of 16.8 ug/L for copper in comparison to the 2.9 ug/l limit the District used for its cost estimates.

Based on the above considerations, EPA does not believe the District cost estimates are comparable withthe estimates obtained for the economic analysis of the CTR.

Comment: Economic analysis The attached table shows that implementation of the proposed limits will result in the reduction of SASM's copper limit from 37 ug/l to 12 ug/l. It is expected that reverse osmosis will be the most economical method to reach this level and that the cost of this operation will be approximately $550,000 per year. This equates to a 30% increase in SASM's budget. This cost is also higher than EPA's estimated costs of $27,000 to $480,000 per plant per year. It appears that the Economic Analysis underestimates the potential statewide cost and should be revised.

Response to: CTR-070-002a

SASM does not describe their existing treatment processes or provide detailed effluent data, thus EPA is not able to estimate a CTR-based effluent limit or evaluate whether process optimization is a viable alternative to reverse osmosis for controlling copper concentrations. EPA estimated that process optimization would be sufficient for the City of Colton (a secondary treatment wastewater sample facility with 9.9 MGD) to meet its estimated CTR-based limit for copper which require a loading reduction of less than 25%. EPA revised its cost estimates for the final CTR and now estimates that per facility costs for POTWs range from $61,000 to $325,000.

Comment: * Based on the comments at the hearing of September 17, and our own estimates, the EPA's economic analysis has serious flaws and does not reflect the full costs for implementation of the CTR. The comments of the California Association of Sanitation Agencies should be given significant weight in this regard.

* For example, the WCA plants will not be able to meet the new criteria for copper, lead, and nickel, as well as some organics. This is true even after maximizing source control, pollution prevention, and process control improvements. Both our plants would need additional "end-of-pipe" treatment, such as reverse osmosis.

* Based on our analysis of the proposed CTR, we will need to implement reverse osmosis in order to meet the requirements of the proposed CTR. Based on this, we estimate that our potential annualized costs for compliance will be $11,220,000. These costs are significantly higher than EPA's estimated costs per plant of $27,000 to $480,000 per year. Thus, we believe strongly that the draft Economic Analysis significantly underestimates the potential statewide costs associated with adoption of the CTR and should be revised.

Response to: CTR-081-005a

EPA disagrees that its Economic Analysis (EA) underestimates costs. West County Agency does not provide the details of their $11.2 million cost estimate, thus EPA cannot evaluate its validity or conduct its own analysis. Based on EPA's sample of 14 POTWs in California, EPA predicts that the state-wide cost impact on POTWs would range from $7.8 million to $41.6 million per year. See the EA for details on the EPA's methodology and costs.

See responses to CTR-056-018, CTR-004-003, and CTR-045-012b.

Comment: Comment #6: General Cost Analysis Concerns

The City of San Jose has several generalized concerns about the costs utilized in the Economic Analysis, which raise questions regarding the validity of that analysis, as follows:

Q.6-1) We believe the real point of undertaking the CTR is to assure water quality throughout State that protects beneficial uses. How can the existing Economic Analysis be sufficient if it does not address the cost of meeting the CTR standards from all sources of discharge? Especially given the amount and cost of aggressive intervention in reducing point source pollution undertaken in California to date?

Q.6-2) Throughout the text of the CTR and within the Economic Analysis, EPA refers repeatedly to the assumption that the State will provide regulatory relief to mitigate severe cost impacts engendered by the CTR. What happens to EPA's cost benefit analysis if even one of those assumptions of regulatory relief is not implemented by the State? While we support EPA's attempt to indicate available regulatory options for the State, local level governments and POTW's have little past experience on which to rationalize acceptance of such assumptions.

Q.6-3) EPA has not estimated the cost to local governments/POTW's/indirect dischargers of securing regulatory relief, nor has that cost been incorporated into the estimate of the CTR impact. How would EPA estimate the cost of securing regulatory relief and how would that additional cost affect the Economic Analysis? Especially since very costly studies may be required in order to qualify for regulatory relief.

Q.6-4) The preamble to the CTR discusses the linkage between the CTR and the National Toxics Rule, and EPA's intent to create a level playing field by setting the CTR standards within the National Toxics Rule Framework. There does not seem to have been a similar attempt to analytically level the playing field vis a vis implementation costs, however, as no indexing or calibration has been undertaken to account for the cumulative costs of efforts to date (see also Q. 4-3), cost equivalency data is rooted in experience outside California, and simple average costs are used to represent widely variable ranges. How would the CTR cost/benefit relationship be affected by adjusting for California's significant previous efforts on water quality control mechanisms and California cost data?

Comment: DR. CHENG: Hi. My name is Ing-Yih Cheng. I'm here today representing the City of Los Angeles, Department of Public Works, Bureau of Sanitation. City of Los Angeles has three treatment plans that are being affected by CTR. They are Tillman Water Reclamation Plant, Los Angeles-Glendale Water Reclamation Plant, and the Terminal Island Treatment Plant. We appreciate the opportunity to testify on the proposed CTR. We have three issues to briefly address because of time limitations, and a more detailed written comment will be forthcoming.

The first and foremost issue concerns with the economic analysis that you have performed on the Tillman plant. When the State Inland Surface Water Plan came out in 1991, the City conducted probable cause assessment for the Tillman plant. The study was completed in April 1992 after a new ISWP-based NPDES permit had been issued. A comparison between this detailed study and EPA economic analysis showed that your economic analysis underestimated the cost required for compliance by orders of magnitude. And the reason for this is because EPA's EA compared CTR to essentially ISWP requirements, since the NPDES permit limits reflect ISWP limits criteria. This is inherently unfair because it ignores treatment costs for those constituents that we are yet to be in full compliance with. We have discussed this matter with our attorney who has advised us to exhaust all legal remedies and hold EPA to the requirement that it prepare a legally defendable economic analysis. We will be glad to make details of our cost estimates available to you, if you like. And on the basis of this comment for one plant alone, we object to EPA's finding that CTR is not a significant rulemaking.

Comment: * The Economic Analysis presents a very weak analysis of potential benefits, which is based on limited information about ambient water quality conditions. Due to this weakness, combined with the paucity of information in the literature regarding the benefits from marginal improvements in water quality, the benefits analysis does a poor job of evaluating the marginal benefits that would result from the implementation of the CTR.

* The Economic Analysis suggests that reductions attributable to point source reductions may be de minimis. For instance, most of the public health benefits appear to be associated with a small number of contaminants, most of which are not discharged in significant quantities by point source dischargers. Cancer risks, for example are dominated by four contaminants, two of which - DDT and PCBs - are probably more the result of historic loadings than due to ongoing point source inputs.

Response to: CTR-034-015

Water quality improvements often involve thresholds such as action levels for fish consumption advisories. However, water quality regulations often contribute only a portion of the improvement needed to surpass a threshold. Although individuals may (or may not) have a willingness to pay for incremental steps toward crossing a threshold, when the threshold is surpassed (e.g., fish consumption advisories are lifted), every action that contributed to the effort should be allocated a portion of the benefits. This was accomplished for the CTR by allocating a portion of the total toxic-free benefits (proportional to the reduction in loadings) to the implementation of point source controls under the CTR.

EPA analyzed potential reductions for over forty toxic pollutants that may be discharged by point sources. EPA expects that reductions in these toxics will lead to a variety of benefits including ecological, health, and recreational benefits. Although certain health risks such as cancer are indeed dominated by only a few toxic contaminants that may not be greatly reduced by point source controls, reductions of these toxics are, nevertheless, expected to yield reductions in cancer cases as well as systemic health risks. EPA expects the annual reduction in cancer cases among recreational anglers after implementation of the CTR to range from 0.0 to 0.1 for San Francisco Bay and 0.0 to 0.8 for freshwater resources. EPA also analyzed the post-CTR hazard quotients (HQ) for systemic risks among recreational anglers with high consumption rates. The HQ for PCBs may be reduced from 11.31 to 5.44 for San Francisco Bay anglers and from 7.02 to 3.28 for freshwater anglers.

Comment: * As indicated in Table Two, much of the benefit estimates are based on little or no empirical data.

Table Two Benefit Areas with Little or No Empirical Foundation Variable/Issue Empirical Evidence

****

"Water quality conditions in many State waters have not been fully assessed, and assessments of waters that have been evaluated often do not contain monitoring data that is extensive or detailed enough to determine whether the waterbody meets all of the proposed criteria." (U.S. EPA, 1997d, page 1-5)

In many cases there is limited information about water quality conditions, and as a result the need for, and benefits associated with, pollution reductions is substantially unknown.

****

"EPA found no available studies of the value to California anglers of reducing toxic contamination in surface waters." (U.S. EPA, 1997a, page ES-12).

Fishing-related benefits are based on a single out of-state report which estimated "...the value of reducing toxic contaminants in a popular boat fishery that has experienced widespread and highly publicized contamination and fish consumption advisories" (U.S. EPA, 1997a, page 8-17). This analysis most likely bears little or no relation to California conditions, and should not be used as the sole basis for benefits estimation.

****

Assumes that the proposed rules will result in "appreciable" increases in water- and land-related recreation apart from fishing.

No evidence is presented that boaters, swimmers, hunters or others will increase their use of California's resources because of a marginal change in pollutant load.

****

Assumes the rule would likely engender some "passive use" benefits.

Passive use benefits estimates are based on a 13-year old analysis which may bear little relevance to the Rule. The supporting data for this benefit category is so poor as to forgo any quantification of it.

****

Uses effluent concentration data from the Sacramento County POTW to analyze freshwater resources.

"...may not be representative of effluent from other facilities" (U.S. EPA, 1997a, page 7-6).

****

Assumes San Francisco Bay discharges have not changed over the last decade.

The Analysis is based on ten-year old data which may not be representative of current conditions.

****

"Reductions in toxics may contribute to improved conditions for the successful recovery of federal and State threatened and endangered species..."

No evidence is provided supporting this claim.

****

Assumes relative point/non-point source contribution to particular contaminants based on limited data.

"None of the data sources ... definitely estimates the relative point source contribution of PCBS, dioxin, pesticides, or mercury..." (U.S. EPA, 1997d, page 7-32).

****

Response to: CTR-035-071

EPA defined toxic-impaired waters as waters rated medium or poor quality for at least one or more toxic pollutant or group of pollutants. EPA acknowledged that this definition may result in an overestimate of toxic-impairment (EA Chapter 8). However, the rating of these waters corresponds to EPA's categories of 'not fully supporting' and 'partially supporting' designated uses. The existence of waters not supporting and only partially supporting designated uses is indicative of the need for and benefits associated with pollution controls.

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA did not include values for water- and land-related benefits other than fishing, but noted that potential benefits may be underestimated because these benefit categories are not included. As described in the EA (Chapter 8), EPA believes that these benefits may be appreciable because such recreational activities (e.g., boating, swimming, picnicking, and related activities) have been shown in empirical research to be highly valued, and even modest changes in participation or user values could lead to sizable benefits statewide. Some of these activities can be closely associated with water quality attributes (e.g., swimming) and others might increase due to their association with fishing, swimming, or other activities in which the
participants might engage.

As described in the EA (Chapter 8), research provides empirical evidence of the passive use values associated with improved water quality and fisheries. Research also indicates that these values are at least half as great as recreational values, such that if they are potentially applicable to a policy action, providing a rough approximation is preferable, with proper caveats, to omitting them from the analysis of benefits and costs. EPA believes that the studies used to calculate the ratio of passive use to use value are applicable to the CTR (see also comment and response CTR-026-009). Therefore, EPA applies a ratio of 0.5 to obtain an estimate of passive use values for households with active recreational anglers. Based on a review of the literature, EPA believes that non-angling household do indeed have a passive use value. To determine a lower-bound estimate of passive use values for non-angling households, EPA assumed that the value may be 30% of the value for angling households. For analysis of the final CTR, EPA revised the upper-bound estimate assuming that the passive use value of non-angling households may be 90% of those for angling households. This revision is based on a study by Loomis et al. (1991), who estimated the benefits of improved fishery, wetland, and waterfowl resources in the San Joaquin Valley to users and nonusers residing in California.

By multiplying a ratio of passive use to use value by recreational fishing values, which EPA apportioned to reflect the relative contribution of point sources, EPA also accounted for attribution in its estimate of passive use values.

For the EA that accompanied the proposal, EPA conducted an extensive search of the literature for more recent data or information related to the relative contributions of various sources to water quality impairments. In the EA accompanying the proposal, EPA solicited additional data, however, none was received. In revising the EA for the final rulemaking, EPA conducted an additional extensive search of the literature and research efforts at California universities for relevant information. EPA has incorporated any new information into the revised EA for the final rule.

EPA provided a qualitative description of the potential impacts of toxics on ecological resources and the potential benefits from reducing toxic loadings to the state's water resources (see Chapter 6 of the EA that accompanied the proposed rule). As stated in that chapter, EPA performed a qualitative assessment of the ecologic benefits of the proposed rule (IEC, 1996), rather than a contaminant-specific quantitative

assessment of the magnitude and extent of benefits accruing for each affected aquatic system. However, without performing a complete quantitative analysis, EPA concluded that potential ecologic benefits from implementation of the CTR may include:

* Reductions in toxics loadings are expected to contribute to improved conditions for California fish spawning and/or migration in bays/harbors and estuaries, lakes, rivers and streams, and saline lakes.

* Reductions in bioaccumulative chemicals of concern that may currently affect fish and wildlife throughout the state, including selenium, mercury, PCBs, dioxins, and chlorinated pesticides.

* Reductions in toxics may contribute to improved conditions for the successful recovery of federal and State threatened and endangered species, such as the delta smelt, desert pupfish, California brown pelican, bald eagle, California clapper rail, California tiger salamander, and western snowy plover.

* Reductions in toxics may reduce adverse toxics-related impacts on aquatic and terrestrial wildlife in two important areas of California: the San Francisco Bay watershed and the Central Valley (see Case Studies in [U.S. EPA, 1997]).

* Reductions in the concentrations of both selenium and pesticides in the waters that feed the Salton Sea may contribute to improved conditions for the restoration and maintenance of currently declining populations of wildlife, including threatened and endangered species such as the California brown pelican, peregrine falcon, bald eagle, Yuma clapper rail, and desert pupfish (see Case Studies in [U.S. EPA, 1997]).

* Improved water quality and associated improvements in survival, growth, and reproductive capacity of aquaticand aquatic-dependent organisms may contribute to the increased stability, resilience, and overall health of numerous ecosystems throughout California, and may contribute to protecting, restoring, and maintaining California's ecological diversity.

EPA used ranges to address the uncertainty in the relative point source contribution of different contaminants. These ranges were based on toxic-weighted pollutant loads so that the results could not be driven by pollutants with little impact on the environment or public health. EPA also solicited additional or updated data and information on this issue in the EA but did not receive any. In revising the EA for the final rulemaking, EPA conducted an additional extensive search of the literature and research efforts at California universities for relevant information. EPA has incorporated any new information into the revised EA for the final rule.

Comment: * Likewise, as indicated in Table Three, the benefits analysis is based on a number of assumptions which may act to overstate benefits.

Table Three Other Major Technical Assumptions Which Could Affect Benefits Estimates

Assumptions Potential Impact on Analysis

****

"The benefits estimates in this report represent the total benefits expected to occur once water quality control programs have been fully implemented by California and water quality criteria have been achieved for toxic pollutants." (U.S. EPA, 1997d, page 1-8)

Cost analysis explicitly includes exemptions (cost thresholds) to rule attainment. Likewise, non-point sources are excluded. Both of these factors indicate that water quality criteria will not be achieved, and certainly not at the estimated cost.

****

Assumes anglers are aware of toxic contamination in waters that have no fish consumption advisories.

No empirical evidence provided on behavioral responses, if any, to actual or perceived public health concerns.

****

Assumes "potential benefits for all California waters affected by toxics, not just those waters under fishing consumption advisories" (U.S. EPA, 1997a, page 8-17).

May overstate benefits related to point source reductions, as most of the fishing contaminants are related to non-point sources.

****

Assumes little substitution among fishing sites.

Estimates of the value of increased fishing participation most likely overstates angler behavior as a result of substitution between fishing sites.

****

Assumes one-to-one benefit from reduction in toxics.

Other factors (e.g., habitat alteration) may pose more serious threats to the environment, and partially negate rule benefits. For example, complete reductions in point source pollution is meaningless if the water body's habitat has been substantially disturbed by development.

****

Response to: CTR-035-072

The commenter is referring to the estimate of total potential benefits in the analysis of benefits document. In EPA's EA for the proposed (and final) rule, only the portion of benefits expected to be achieved by implementing controls on point source dischargers are counted. EPA recognizes that the proposed standards will not be achieved in some cases by controlling point sources alone. EPA's assumptions regarding the attribution of benefits to the rule are described in the EA for the proposed rule in Chapter 7.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA Chapter 8). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to CTR-035-009a.)

U.S. EPA, 1993. Regulatory Impact Analysis of the Proposed Great Lakes Water Quality Guidance. Final Report, April 15.

Behavioral responses to public health concerns and pollution have been documented in the literature. For example, as shown in the table below, anglers in the Great Lakes region report taking fewer fishing trips, changing fishing locations, and changing cooking methods in response to fish consumption advisories. EPA revised it's analysis to include this information.

Behavioral Responses of Anglers to Fish Consumption Advisories

Study	Location	Reported Behavioral Response
Fiore et al. (1989)	Lake Michigan and Green Bay, Wisconsin	57% Reported changing fishing habits and/or fish consumption
Knuth, Connelly, and Shapiro (1993)	Ohio River	37% Took fewer trips
		26% Changed fishing locations
		26% Changed species sought
		22% Changed cleaning methods
		17% Changed size of fish consumed
		13% Changed cooking methods
Vena (1992)	Lake Ontario, New York	53% Ate less fish
		31% Changed preparation methods
		30% Changed fishing locations
		20% Changed species sought
		16% No longer ate fish
		16% Took fewer trips
Silverman (1990)	Lake St. Clair	56% Ate less fish
	Detroit River	56% Changed cleaning methods
	Lake Erie	41% Ate smaller fish
		31% Changed fishing locations
		31% Ate different species

		28% Changed cooking methods 21% Fished for different species 10% Took fewer fishing trips
Knuth and Connelly (1992)	New York	70% Ate less fish 40% Cooked fish differently 17% No longer ate sport caught fish
West et al. (1993)	Michigan	86% Cooked fish differently (Great Lakes anglers) 80% Ate less fish (Great Lakes anglers) 75% Cleaned fish differently 46% Ate less fish (overall) 27% Cooked fish differently (overall)

Although the standards established by the CTR apply to the waterbody (i.e., inland surface waters and enclosed bays and estuaries) EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

EPA acknowledged that increased angling activity at sites experiencing reductions in toxic contaminants may reflect a shift in activity from substitute sites rather than a net increase. Because EPA could not account for substitute sites in this analysis, EPA estimated lower bound benefits of $0 (i.e., assuming no net increases in activity; see EA, Chapter 8).

EPA believes that where appropriate habitat, species, and other conditions exist, yet waters are impaired by toxic pollutants, the standards established by the CTR will result in attaining designated uses. At sites where designated uses are also impaired by factors such as habitat alteration, exotic species, or inadequate flows, these conditions may have to be corrected to fully attain the use. Notwithstanding, even if a receiving water does not fully attain its use because of other factors, this does not justify further degrading the water body by failing to reduce loadings of toxic pollutants.

Comment: ATTACHMENT: 3 - 2 A Criteria Review of: "Discrete Choice Models to Value Changes in Environmental Quality: A Great Lakes Case Study"(*1)

Introduction This dissertation is primarily concerned with examining economic models of natural resource valuation. Specifically, two models were examined, the travel cost method and the contingent valuation method. The main purpose of this dissertation was to apply these probabilistic choice models to a new data set and examine their performance against one another. In this study, the main use of contingent valuation modeling is to provide alternative value estimates for comparison to the values produced by the travel cost model. The data set examined consisted of two sets of surveys completed by a total of 513 anglers in Wisconsin. One set of surveys examined Wisconsin anglers who fished for trout and salmon in the Great Lakes (274 respondents), while the second set examined those who fished for trout and salmon in inland waters other than the Great Lakes (239 respondents). The primary concern of this critique lies in the application of some of Lyke's findings to the benefits analysis of EPA's California Toxics Rule(*2). Specifically, EPA uses Lyke's results in calculating the potential benefits accrued by California fisheries attributable to the implementation of the California Toxics Rule.

The Models Two models are used in analyzing the data. The first is the travel cost model which links travel costs and fishing success to angler decisions of where to fish. The second model is from a class of questioning methods known as contingent valuation. The travel model estimates non-market value from observable behavior (e.g. distance traveled to fishing sites) while the contingent valuation method simply measures attitudes (the willingness to pay to use a fishing site) not economic behavior per se. This critique is primarily concerned with the contingent valuation questions found in the surveys. These questions measured respondents valuation of their fishing experience (a valuation of the fishery) in relation to toxic contamination. The responses to these questions provide the basis for EPAs valuation of the improved fishing experience for California anglers after implementation of the California Toxics Rule.

Sample Design Data The contingent valuation model data are taken from two mail surveys of anglers who held fishing licenses in 1988 and fished in 1989. This study only examined the behavior and views of anglers who fish for trout and salmon. Millions of trout and salmon are planted in Wisconsin waters annually and catching them is a popular pastime. However, most of these fish are hatchery raised and as such represent a major expense for the state fisheries agency. To help defray these costs, the state requires a special trout and salmon stamp on the licenses of anglers who catch these fish. This added cost might deter some anglers, who then would not be in the "angler population" examined in this study. Also, since anglers who fish primarily for trout and salmon are willing to pay more to catch these prized gamefish, they may be more conscientious in returning questionnaires that "typical" anglers. Both these factors may cause overestimates of fisheries value in this study. This critique is primarily concerned with the data provided by Wisconsin anglers who were identified as having fished the Great Lakes for trout and salmon in 1989. This set consisted of 274 useable questionnaires (out of a possible 368 anglers).

Results Contingent valuation results were generated from responses to direct questions about the value of a given resource (in this case the Great Lakes sport fisheries). The contingent valuation models are applied to value the Wisconsin Great Lakes sport fisheries under current conditions as well as for hypothetial scenarios where contaminants are removed from the fishery and where native lake trout populations are rehabilitated. There is no travel cost model alternative to measuring these values. Lyke determined that the current value (in 1989 dollars) of the Great Lakes Fishery was $339.43/angler/year (with a standard error of $53.17). The value of a hypothetically "contaminant free" fishery to anglers

was $377.18/angler/year (with a standard error of $64.60). These values can be found in Table 15 (pg. 169) of Lyke's dissertation. It appears that EPA uses these values to estimate the potential increase in value to California fisheries with the implementation of the California Toxics Rule. EPA estimates an 11.1 percent to 31.3 percent in value to fisheries following the application of the California Toxics Rule and the subsequent elimination of toxicants from affected waterbodies. These estimated increases appear to be drawn from the values presented by Lyke. There is an 11.1 percent increase in worth when the mean value of current conditions are compared to the mean value of the hypothetical "contaminant free" conditions. There is a 31.8 percent increase in worth when the lower end (mean value minus the standard error) of the value for current conditions is compared to the mean value of the "contaminant free" conditions.

Conclusions:

1.) There is a lack of data on the value anglers in California place upon reducing toxic contamination to fisheries, so EPA used the increase in values produced by Lyke's model. However, the increases in value which Lyke shows are based on the responses of 274 individual anglers to only two contingent valuation questions in a mail survey containing a total of 64 questions. This is clearly a very small sample of the population of Wisconsin anglers and may have caused some bias in the analysis. This was probably a representative sample of anglers but not a random sample of anglers.

2.) Only anglers who fished for trout and salmon in the Wisconsin Great Lakes were surveyed. These anglers may not be representative of the typical Wisconsin Great Lakes angler, and this data does not show any valuation for any fishery other than trout and salmon.

3.) It is not clear how EPA derived the upper limit of their potential increase in fisheries value (31.3 percent). It is possible that EPA used the "contaminant free" mean ($377. 18/angler/year) and compared that to the low end value (mean minus the standard error) of the value of the fishery under current conditions ($286.26/angler/year), yielding an increase in value of 31.8 percent. Another portion of Lyke's analysis actually shows "contaminant free" fisheries to be valued lower than the current "contaminated" fishery. Inland fishing anglers who fish for trout and salmon were less willing to pay for a contaminant free fishery. The mean value of the inland fishery under current conditions ($720.12/angler/year) compared to the mean value of a "contaminant free" inland fishery ($597.42/angler/year) yields a loss in value of 17 percent.

4.) There is no evidence than any portion of Lyke's dissertation has undergone peer review outside the University of Wisconsin-Madison. An extensive literature search found no peer reviewed journal publications by the author. Without proper peer review, its methods and conclusions must remain in doubt.

5.) The degree and extent to which individual Great Lakes fishing sites and fisheries are contaminated by toxicants was not considered in this study. Therefore, it is unclear how well the study's findings can be applied to "contaminated" fisheries in California.

6.) Contingent valuation measures the attitudes of anglers, not their behavior. More specifically, it measures an anglers stated willingness to pay or compensate, not the actual behavior of paying or compensating.

(*2) U.S. EPA Analysis of the Potential Benefits Related to Implementation of the California Toxics Rule. June 1997.

Response to: CTR-040-052

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA p. 8-17). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to Issue 3.)

U.S. EPA, 1993. Regulatory Impact Analysis of the Proposed Great Lakes Water Quality Guidance. Final Report, April 15.

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA agrees that the contingent valuation method (CVM) elicits an individual's stated willingness to pay or accept compensation. The benefit-cost comparisons in EAs are prepared to inform the public and policy makers. Thus, the strengths and weaknesses of all aspects of the EA, including methodologies for estimating benefits, need to be made clear so that readers are aware of the limits and uncertainties. However, a 1993 Blue Ribbon Panel convened by the National Oceanic and Atmospheric Administration (NOAA) evaluated CVM and found it to be an appropriate methodology for measuring values. It is also the only method accepted by the U.S. Department of the Interior (DOI) to estimate nonuse values and has withstood Federal Court review for its use in litigation contexts.

Additionally, much of the criticism of CVM is conceptual rather than based on empirical research. Where CVM can be compared to other research techniques (e.g., use values estimated by the travel cost methodology or the hedonic price method), CVM is shown to yield similar values (see Brookshire et al., 1982 and Smith et al., 1986). Additionally, in several field experiments, actual purchase decisions were compared to hypothetical purchase decisions (Bishop and Heberlein, 1978 and Dickie et al., 1987). In all of these studies, hypothetical behavior was sufficiently predictive of actual behavior that researchers concluded meaningful values could be obtained for benefit-cost analysis or damage assessment.

Comment: ATTACHMENT: B - 2 A Criteria Review of: "Discrete Choice Models to Value Changes in Environmental Quality: A Great Lakes Case Study"(*1)

Introduction This dissertation is primarily concerned with examining economic models of natural resource valution. Specifically, two models were examined, the travel cost method and the contingent valuation method. The main purpose of this dissertation was to apply these probabilistic choice models to a new data set and examine their performance against one another. In this study, the main use of contingent valuation modeling is to provide alternative value estimates for comparison to the values produced by the travel cost model. The data set examined consisted of two sets of surveys completed by a total of 513 anglers in Wisconsin. One set of surveys examined Wisconsin anglers who fished for trout and salmon in the Great Lakes (274 respondents), while the second set examined those who fished for trout and salmon in inland waters other than the great lakes (239 respondents). The primary concern of this critique lies in the application of some of Lyke's findings to the benefits analysis of EPA's California Toxics Rule(*2). Specifically, EPA uses Lyke's results in calculating the potential benefits accrued by California fisheries attributable to the implementation of the California Toxics Rule.

The Models Two models are used in analyzing the data. The first is the travel cost model which links travel costs and fishing success to angler decisions of where to fish. The second model is from a class of questioning methods known as contingent valuation. The travel model estimates non-market value from observable behavior (e.g. distance traveled to fishing sites) while the contingent valuation method simply measures attitudes (the willingness to pay to use a fishing site) not economic behavior per se. This critique is primarily concerned with the contingent valuation questions found in the surveys. These questions measured respondents valuation of their fishing experience (a valuation of the fishery) in relation to toxic contamination. The responses to these questions provide the basis for EPAs valuation of the improved fishing experience for California anglers after implementation of the California Toxics Rule.

Sample Design Data The continent valuation model data are taken from two mail surveys of anglers who held fishing licenses in 1988 and fished in 1989. This study only examined the behavior and views of anglers who fish for trout and salmon. Millions of trout and salmon are planted in Wisconsin waters annually and catching them is a popular pastime. However, most of these fish are hatchery raised and as such represent a major expense for the state fees agency. To help defray these costs, the state requires a special trout and salmon stamp on the licenses of anglers who catch these fish. This added cost might deter some anglers, who then would not be in the "angler population" examined in this study. Also, since anglers who fish primarily for trout and salmon are willing to pay more to catch these prized gamefish, they may be more conscientious in returning questionnaires than "typical" anglers. Both these factors may cause overestimates of fisheries value in this study. This critique is primarily concerned with the data provided by Wisconsin anglers who were identified as having fished the Great Lakes for trout and salmon in 1989. This set consisted of 274 useable questionnaires (out of a possible 368 anglers).

Results Contingent valuation results were generated from responses to direct questions about the value of a given resource (in this case the Great Lakes sport fisheries). The contingent valuation models are applied to value the Wisconsin Great Lakes sport fisheries under current conditions as well as for hypothetical scenarios where contaminants are removed from the fishery and where native lake trout populations are rehabilitated. There is no travel cost model alternative to measuring these values. Lyke determined that the current value (in 1989 dollars) of the Great Lakes Fishery was $339.43/angler/year

(with a standard error of $53.17). The value of a hypothetically "contaminant free" fishery to anglers was $377.18/angler/year (with a standard error of $64.60). These values can be found in Table 15 (pg. 169) of Lyke's dissertation. It appears that EPA uses these values to estimate the potential increase in value to California fisheries with the implementation of the California Toxics Rule. EPA estimates an 11.1 percent to 31.3 percent in value to fisheries following the application of the California Toxics Rule and the subsequent elimination of toxicants from affected waterbodies. These estimated increases appear to be drawn from the values presented by Lyke. There is an 11.1 percent increase in worth when the mean value of current conditions are compared to the mean value of the hypothetical "contaminant free" conditions. There is a 31.8 percent increase in worth when the lower end (mean value minus the standard error) of the value for current conditions is compared to the mean value of the "contaminant free" conditions.

Conclusions:

1.) There is a lack of data on the value anglers in California place upon reducing toxic contamination to fisheries, so EPA used the increase in values produced by Lyke's model. However, the increases in value which Lyke shows are based on the responses of 274 individual anglers to only two contingent valuation questions in a mail survey containing a total of 64 questions. This is clearly a very small sample of the population of Wisconsin anglers and may have caused some bias in the analysis. This was probably a representative sample of anglers but not a random sample of anglers.

2.) Only anglers who fished for trout and salmon in the Wisconsin Great Lakes were surveyed. These anglers may not be representative of the typical Wisconsin Great Lakes angler, and this data does not show any valuation for any fishery other than trout and salmon.

3.) It is not clear how EPA derived the upper limit of their potential increase in fisheries value (31.3 percent). It is possible that EPA used the "contaminant free" mean ($377. 18/angler/year) and compared that to the low end value (mean minus the standard error) of the value of the fishery under current conditions ($286.26/angler/year), yielding an increase in value of 31.8 percent. Another portion of Lyke's analysis actually shows "contaminant free" fisheries to be valued lower than the current "contaminated" fishery. Inland fishing anglers who fish for trout and salmon were less willing to pay for a contaminant free fishery. The mean value of the inland fishery under current conditions ($720.12/angler/year) compared to the mean value of a "contaminant free" inland fishery ($597.42/angler/year) yields a loss in value of 17 percent.

4.) There is no evidence than any portion of Lyke's dissertation has undergone peer review outside the University of Wisconsin-Madison. An extensive literature search found no peer reviewed journal publications by the author. Without proper peer review, its methods and conclusions must remain in doubt.

5.) The degree and extent to which individual Great Lakes fishing sites and fisheries are contaminated by toxicants was not considered in this study. Therefore, it is unclear how well the study's findings can be applied to "contaminated" fisheries in California.

6.) Contingent valuation measures the attitudes of anglers, not their behavior. More specifically, it measures an anglers stated willingness to pay or compensate, not the actual behavior of paying or compensating.

Wisconsin-Madison, 1993.

(*2) U.S. EPA Analysis of the Potential Benefits Related to Implementation of the California Toxics Rule. June 1997.

Response to: CTR-041-048

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA Chapter 8). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to CTR-035-009a.)

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters.

However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

EPA agrees that the contingent valuation method (CVM) elicits an individual's stated willingness to pay or accept compensation. The benefit-cost comparisons in EAs are prepared to inform the public and policy makers. Thus, the strengths and weaknesses of all aspects of the EA, including methodologies for estimating benefits, need to be made clear so that readers are aware of the limits and uncertainties. However, a 1993 Blue Ribbon Panel convened by the National Oceanic and Atmospheric Administration (NOAA) evaluated CVM and found it to be an appropriate methodology for measuring values. It is also the only method accepted by the U.S. Department of the Interior (DOI) to estimate nonuse values and has withstood Federal Court review for its use in litigation contexts.

Additionally, much of the criticism of CVM is conceptual rather than based on empirical research. Where CVM can be compared to other research techniques (e.g., use values estimated by the travel cost methodology or the hedonic price method), CVM is shown to yield similar values (see Brookshire et al., 1982 and Smith et al., 1986). Additionally, in several field experiments, actual purchase decisions were compared to hypothetical purchase decisions (Bishop and Heberlein, 1978 and Dickie et al., 1987). In all of these studies, hypothetical behavior was sufficiently predictive of actual behavior that researchers concluded meaningful values could be obtained for benefit-cost analysis or damage assessment (Ohio, 880 F. 2d, at pp. 442 and 462-63).

Comment: ATTACHMENT: 3 - 2 A Criteria Review of: "Discrete Choice Models to Value Changes in Environmental Quality: A Great Lakes Case Study"(*1)

Introduction This dissertation is primarily concerned with examining economic models of natural

resource valution. Specifically, two models were examined, the travel cost method and the contingent valuation method. The main purpose of this dissertation was to apply these probabilistic choice models to a new data set and examine their performance against one another. In this study, the main use of contingent valuation modeling is to provide alternative value estimates for comparison to the values produced by the travel cost model. The data set examined consisted of two sets of surveys completed by a total of 513 anglers in Wisconsin. One set of surveys examined Wisconsin anglers who fished for trout and salmon in the Great Lakes (274 respondents), while the second set examined those who fished for trout and salmon in inland waters other than the great lakes (239 respondents). The primary concern of this critique lies in the application of some of Lyke's findings to the benefits analysis of EPA's California Toxics Rule(*2). Specifically, EPA uses Lyke's results in calculating the potential benefits accrued by California fisheries attributable to the implementation of the California Toxics Rule.

The Models Two models are used in analyzing the data. The first is the travel cost model which links travel costs and fishing success to angler decisions of where to fish. The second model is from a class of questioning methods known as contingent valuation. The travel model estimates non-market value from observable behavior (e.g. distance traveled to fishing sites) while the contingent valuation method simply measures attitudes (the willingness to pay to use a fishing site) not economic behavior per se. This critique is primarily concerned with the contingent valuation questions found in the surveys. These questions measured respondents valuation of their fishing experience (a valuation of the fishery) in relation to toxic contamination. The responses to these questions provide the basis for EPAs valuation of the improved fishing experience for California anglers after implementation of the California Toxics Rule.

Sample Design Data The continent valuation model data are taken from two mail surveys of anglers who held fishing licenses in 1988 and fished in 1989. This study only examined the behavior and views of anglers who fish for trout and salmon. Millions of trout and salmon are planted in Wisconsin waters annually and catching them is a popular pastime. However, most of these fish are hatchery raised and as such represent a major expense for the state fees agency. To help defray these costs, the state requires a special trout and salmon stamp on the licenses of anglers who catch these fish. This added cost might deter some anglers, who then would not be in the "angler population" examined in this study. Also, since anglers who fish primarily for trout and salmon are willing to pay more to catch these prized gamefish, they may be more conscientious in returning questionnaires than "typical" anglers. Both these factors may cause overestimates of fisheries value in this study. This critique is primarily concerned with the data provided by Wisconsin anglers who were identified as having fished the Great Lakes for trout and salmon in 1989. This set consisted of 274 useable questionnaires (out of a possible 368 anglers).

Results Contingent valuation results were generated from responses to direct questions about the value of a given resource (in this case the Great Lakes sport fisheries). The contingent valuation models are applied to value the Wisconsin Great Lakes sport fisheries under current conditions as well as for hypothetical scenarios where contaminants are removed from the fishery and where native lake trout populations are rehabilitated. There is no travel cost model alternative to measuring these values. Lyke determined that the current value (in 1989 dollars) of the Great Lakes Fishery was $339.43/angler/year (with a standard error of $53.17). The value of a hypothetically "contaminant free" fishery to anglers was $377.18/angler/year (with a standard error of $64.60). These values can be found in Table 15 (pg. 169) of Lyke's dissertation. It appears that EPA uses these values to estimate the potential increase in value to California fisheries with the implementation of the California Toxics Rule. EPA estimates an 11.1 percent to 31.3 percent in value to fisheries following the application of the California Toxics Rule and the subsequent elimination of toxicants from affected waterbodies. These estimated increases appear to be drawn from the values presented by Lyke. There is an 11.1 percent increase in worth when the mean value of current conditions are compared to the mean value of the hypothetical "contaminant free"

conditions. There is a 31.8 percent increase in worth when the lower end (mean value minus the standard error) of the value for current conditions is compared to the mean value of the "contaminant free" conditions.

Conclusions:

1.) There is a lack of data on the value anglers in California place upon reducing toxic contamination to fisheries, so EPA used the increase in values produced by Lyke's model. However, the increases in value which Lyke shows are based on the responses of 274 individual anglers to only two contingent valuation questions in a mail survey containing a total of 64 questions. This is clearly a very small sample of the population of Wisconsin anglers and may have caused some bias in the analysis. This was probably a representative sample of anglers but not a random sample of anglers.

2.) Only anglers who fished for trout and salmon in the Wisconsin Great Lakes were surveyed. These anglers may not be representative of the typical Wisconsin Great Lakes angler, and this data does not show any valuation for any fishery other than trout and salmon.

3.) It is not clear how EPA derived the upper limit of their potential increase in fisheries value (31.3 percent). It is possible that EPA used the "contaminant free" mean ($377. 18/angler/year) and compared that to the low end value (mean minus the standard error) of the value of the fishery under current conditions ($286.26/angler/year), yielding an increase in value of 31.8 percent. Another portion of Lyke's analysis actually shows "contaminant free" fisheries to be valued lower than the current "contaminated" fishery. Inland fishing anglers who fish for trout and salmon were less willing to pay for a contaminant free fishery. The mean value of the inland fishery under current conditions ($720.12/angler/year) compared to the mean value of a "contaminant free" inland fishery ($597.42/angler/year) yields a loss in value of 17 percent.

4.) There is no evidence than any portion of Lyke's dissertation has undergone peer review outside the University of Wisconsin-Madison. An extensive literature search found no peer reviewed journal publications by the author. Without proper peer review, its methods and conclusions must remain in doubt.

5.) The degree and extent to which individual Great Lakes fishing sites and fisheries are contaminated by toxicants was not considered in this study. Therefore, it is unclear how well the study's findings can be applied to "contaminated" fisheries in California.

6.) Contingent valuation measures the attitudes of anglers, not their behavior. More specifically, it measures an anglers stated willingness to pay or compensate, not the actual behavior of paying or compensating.

Response to: CTR-044-043

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she

obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA p. 8-17). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to Issue 3.)

U.S. EPA, 1993. Regulatory Impact Analysis of the Proposed Great Lakes Water Quality Guidance. Final Report, April 15.

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA agrees that the contingent valuation method (CVM) elicits an individual's stated willingness to pay or accept compensation. The benefit-cost comparisons in EAs are prepared to inform the public and policy makers. Thus, the strengths and weaknesses of all aspects of the EA, including methodologies for estimating benefits, need to be made clear so that readers are aware of the limits and uncertainties. However, a 1993 Blue Ribbon Panel convened by the National Oceanic and Atmospheric Administration (NOAA) evaluated CVM and found it to be an appropriate methodology for measuring values. It is also the only method accepted by the U.S. Department of the Interior (DOI) to estimate nonuse values and has withstood Federal Court review for its use in litigation contexts.

Additionally, much of the criticism of CVM is conceptual rather than based on empirical research. Where CVM can be compared to other research techniques (e.g., use values estimated by the travel cost methodology or the hedonic price method), CVM is shown to yield similar values (see Brookshire et al., 1982 and Smith et al., 1986). Additionally, in several field experiments, actual purchase decisions were compared to hypothetical purchase decisions (Bishop and Heberlein, 1978 and Dickie et al., 1987). In all of these studies, hypothetical behavior was sufficiently predictive of actual behavior that researchers concluded meaningful values could be obtained for benefit-cost analysis or damage assessment.

Comment: However, the Authority is greatly disappointed that EPA chose not to follow the consensus recommendations for many of the most significant issues, including the methodology used for the EA and the choice of using the most conservative carcinogenicity factor for organic pollutants.

Response to: CTR-052-003c

While EPA agrees that the methodology recommended by the State Task Force on Economic Considerations may be one adequate method for the State to calculate the costs and benefits of State adoption and implementation of water quality standards, EPA never agreed that it would use this method for its own Economic Analysis (EA) for the following reasons:

* EPA's primary responsibility in developing the EA is that it meets the requirements of Executive Order 12866. For program consistency, EPA chose to model the methodology of the EA after the Regulatory Impact Analysis of the Great Lakes Water Quality Guidance which successfully underwent the full Executive Order 12866 process.

* EPA had already established its own methodology and began work on the EA nearly one year before the Task Force began meeting. EPA could not abruptly switch the methodology in the middle of the project due to the limited resources that could be spent on the EA. In addition, many task force members acknowledged that the consensus recommendation was a very resource intensive method and it was uncertain whether adequate data currently existed to bring this methodology to completion. EPA did not have the resources nor the data to perform this type of analysis in the time available.

* The State Task Force recommended a methodology, for future analysis by the State, that would gather ambient data to determine waters that were impaired by toxics, and then determine what actions needed to be taken by point and non-point sources to meet new water quality criteria. EPA determined that this methodology may be appropriate for future State analysis, but was not appropriate for EPA's Economic Analysis since EAs under the CWA typically estimate only costs that EPA can enforce under the Clean Water Act. Therefore, EPA's EA only calculates potential costs and benefits due to controls on NPDES point sources (excluding wet-weather discharges). EPA believes it may be more appropriate for the State to estimate potential impacts on non-point sources since it has the sole authority for enforcing any controls required by non-point sources.

EPA does not agree that its decision to use a 10-6 risk level for carcinogenic pollutants conflicts with any of the State Task Force consensus recommendations. EPA does not observe in the Final Task Force Report, an explicit consensus recommendation of any specific risk level for carcinogenic pollutants.

Comment: EPA has greatly overstated the cost to benefit ratio. The EA concludes that the costs and benefits are nearly equal, which implies a cost to benefit ratio approaching unity, i.e. costs divided by benefits is about 1. The critique prepared by M.Cubed indicates that this is quite faulty, in that costs range from two to nine times the benefits as developed by EPA. Others have noted that the benefits are

also very questionable. Using the costs from No. 3, above, and EPA's high-end benefits, results in costs that are anywhere from 4.6 to 11 times the benefits. No rational person would ever spend that kind of money for such little benefit.

Response to: CTR-052-007

EPA believes that the potential benefits of the rule are reasonably similar to the potential costs. EPA also notes that, as described in the EA, the estimate of benefits may be underestimated as a result of omitted benefit categories while the estimate of costs was based on assumptions that tend to overstate costs. For example, reductions in noncancer health effects are omitted because there are currently few means of linking consumption of toxic contaminants by humans with cases of systemic effects (as opposed to cancer effects, for which dose-response curves have been estimated). Other omitted benefit categories include instream and near stream recreational activities other than fishing (e.g., boating, swimming, picnicking, and related activities). EPA believes other recreation benefits may be appreciable because these activities have been shown in empirical research to be highly valued, and even modest changes in participation or user values could lead to sizable benefits statewide. Some of these activities can be closely associated with water quality attributes (e.g., swimming) and others might increase due to their association with fishing, swimming, or other activities in which the participants might engage.

Comment: ATTACHMENT: 3 - 2 A Criteria Review of: "Discrete Choice Models to Value Changes in Environmental Quality: A Great Lakes Case Study"(*1)

Introduction This dissertation is primarily concerned with examining economic models of natural resource valution. Specifically, two models were examined, the travel cost method and the contingent valuation method. The main purpose of this dissertation was to apply these probabilistic choice models to a new data set and examine their performance against one another. In this study, the main use of contingent valuation modeling is to provide alternative value estimates for comparison to the values produced by the travel cost model. The data set examined consisted of two sets of surveys completed by a total of 513 anglers in Wisconsin. One set of surveys examined Wisconsin anglers who fished for trout and salmon in the Great Lakes (274 respondents), while the second set examined those who fished for trout and salmon in inland waters other than the great lakes (239 respondents). The primary concern of this critique lies in the application of some of Lyke's findings to the benefits analysis of EPA's California Toxics Rule(*2). Specifically, EPA uses Lyke's results in calculating the potential benefits accrued by California fisheries attributable to the implementation of the California Toxics Rule.

The Models Two models are used in analyzing the data. The first is the travel cost model which links travel costs and fishing success to angler decisions of where to fish. The second model is from a class of

questioning methods known as contingent valuation. The travel model estimates non-market value from observable behavior (e.g. distance traveled to fishing sites) while the contingent valuation method simply measures attitudes (the willingness to pay to use a fishing site) not economic behavior per se. This critique is primarily concerned with the contingent valuation questions found in the surveys. These questions measured respondents valuation of their fishing experience (a valuation of the fishery) in relation to toxic contamination. The responses to these questions provide the basis for EPAs valuation of the improved fishing experience for California anglers after implementation of the California Toxics Rule.

Sample Design Data The continent valuation model data are taken from two mail surveys of anglers who held fishing licenses in 1988 and fished in 1989. This study only examined the behavior and views of anglers who fish for trout and salmon. Millions of trout and salmon are planted in Wisconsin waters annually and catching them is a popular pastime. However, most of these fish are hatchery raised and as such represent a major expense for the state fees agency. To help defray these costs, the state requires a special trout and salmon stamp on the licenses of anglers who catch these fish. This added cost might deter some anglers, who then would not be in the "angler population" examined in this study. Also, since anglers who fish primarily for trout and salmon are willing to pay more to catch these prized gamefish, they may be more conscientious in returning questionnaires than "typical" anglers. Both these factors may cause overestimates of fisheries value in this study. This critique is primarily concerned with the data provided by Wisconsin anglers who were identified as having fished the Great Lakes for trout and salmon in 1989. This set consisted of 274 useable questionnaires (out of a possible 368 anglers).

Results Contingent valuation results were generated from responses to direct questions about the value of a given resource (in this case the Great Lakes sport fisheries). The contingent valuation models are applied to value the Wisconsin Great Lakes sport fisheries under current conditions as well as for hypothetical scenarios where contaminants are removed from the fishery and where native lake trout populations are rehabilitated. There is no travel cost model alternative to measuring these values. Lyke determined that the current value (in 1989 dollars) of the Great Lakes Fishery was $339.43/angler/year (with a standard error of $53.17). The value of a hypothetically "contaminant free" fishery to anglers was $377.18/angler/year (with a standard error of $64.60). These values can be found in Table 15 (pg. 169) of Lyke's dissertation. It appears that EPA uses these values to estimate the potential increase in value to California fisheries with the implementation of the California Toxics Rule. EPA estimates an 11.1 percent to 31.3 percent in value to fisheries following the application of the California Toxics Rule and the subsequent elimination of toxicants from affected waterbodies. These estimated increases appear to be drawn from the values presented by Lyke. There is an 11.1 percent increase in worth when the mean value of current conditions are compared to the mean value of the hypothetical "contaminant free" conditions. There is a 31.8 percent increase in worth when the lower end (mean value minus the standard error) of the value for current conditions is compared to the mean value of the "contaminant free" conditions.

Conclusions:

1.) There is a lack of data on the value anglers in California place upon reducing toxic contamination to fisheries, so EPA used the increase in values produced by Lyke's model. However, the increases in value which Lyke shows are based on the responses of 274 individual anglers to only two contingent valuation questions in a mail survey containing a total of 64 questions. This is clearly a very small sample of the population of Wisconsin anglers and may have caused some bias in the analysis. This was probably a representative sample of anglers but not a random sample of anglers.

2.) Only anglers who fished for trout and salmon in the Wisconsin Great Lakes were surveyed. These

anglers may not be representative of the typical Wisconsin Great Lakes angler, and this data does not show any valuation for any fishery other than trout and salmon.

3.) It is not clear how EPA derived the upper limit of their potential increase in fisheries value (31.3 percent). It is possible that EPA used the "contaminant free" mean ($377. 18/angler/year) and compared that to the low end value (mean minus the standard error) of the value of the fishery under current conditions ($286.26/angler/year), yielding an increase in value of 31.8 percent. Another portion of Lyke's analysis actually shows "contaminant free" fisheries to be valued lower than the current "contaminated" fishery. Inland fishing anglers who fish for trout and salmon were less willing to pay for a contaminant free fishery. The mean value of the inland fishery under current conditions ($720.12/angler/year) compared to the mean value of a "contaminant free" inland fishery ($597.42/angler/year) yields a loss in value of 17 percent.

4.) There is no evidence than any portion of Lyke's dissertation has undergone peer review outside the University of Wisconsin-Madison. An extensive literature search found no peer reviewed journal publications by the author. Without proper peer review, its methods and conclusions must remain in doubt.

5.) The degree and extent to which individual Great Lakes fishing sites and fisheries are contaminated by toxicants was not considered in this study. Therefore, it is unclear how well the study's findings can be applied to "contaminated" fisheries in California.

6.) Contingent valuation measures the attitudes of anglers, not their behavior. More specifically, it measures an anglers stated willingness to pay or compensate, not the actual behavior of paying or compensating.

Response to: CTR-054-047

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA p. 8-17). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish

populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to Issue 3.)

U.S. EPA, 1993. Regulatory Impact Analysis of the Proposed Great Lakes Water Quality Guidance. Final Report, April 15.

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA agrees that the contingent valuation method (CVM) elicits an individual's stated willingness to pay or accept compensation. The benefit-cost comparisons in EAs are prepared to inform the public and policy makers. Thus, the strengths and weaknesses of all aspects of the EA, including methodologies for estimating benefits, need to be made clear so that readers are aware of the limits and uncertainties.

However, a 1993 Blue Ribbon Panel convened by the National Oceanic and Atmospheric Administration (NOAA) evaluated CVM and found it to be an appropriate methodology for measuring values. It is also the only method accepted by the U.S. Department of the Interior (DOI) to estimate nonuse values and has withstood Federal Court review for its use in litigation contexts.

Additionally, much of the criticism of CVM is conceptual rather than based on empirical research. Where CVM can be compared to other research techniques (e.g., use values estimated by the travel cost methodology or the hedonic price method), CVM is shown to yield similar values (see Brookshire et al., 1982 and Smith et al., 1986). Additionally, in several field experiments, actual purchase decisions were compared to hypothetical purchase decisions (Bishop and Heberlein, 1978 and Dickie et al., 1987). In all of these studies, hypothetical behavior was sufficiently predictive of actual behavior that researchers concluded meaningful values could be obtained for benefit-cost analysis or damage assessment.

Comment: Major Concerns About the Proposed Criteria and Rule

1. The Proposal is Based on Poor Data and Will Not Result in Better Water Quality for California. We stated that our own attainability analysis and that of BADA show that San Francisco,) will be impacted by this rule. Unfortunately, due to the short time for review, the poor quality of data and basis for statements and assumptions in the proposal and the problem with detection limits we cannot specifically say what will be the cost to Sari Francisco. One analysis tell us it could be $2.3 million per year annualized costs and another analysis tells us it could be much more. We strongly recommend major revision to the proposal and the economic analysis before final promulgation for the following reasons:

The propose rule will cost more than EPA estimates, will not be applicable to those discharges that are of most concern and which interfere with the designated uses and therefore the rule will produce less benefits than EPA estimates.

Response to: CTR-090-008

Although the standards established by the CTR apply to all sources, EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source

share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

Comment: This comment addresses the mercury criteria for continuous concentration (CCC) proposed in 40 CFR, part 131(*1). The proposed aquatic health and human health criteria do not protect aquatic life or humans from mercury contamination. This is demonstrated by the scientific data presented herein. That information includes published and unpublished results from scientists with established reputations in environmental research.

The aquatic life mercury CCC is proposed to be raised sixty-fold, from the National Toxics Rule standard of 0.012 micrograms per liter (ppb) to 0.770 ppb. The human health criteria is proposed to be raised four-fold, from 0.0 12 ppb to 0.050 ppb. These proposed changes have potentially devastating economic and environmental costs that must be included in the EPA's cost-benefit analysis. Water treatment costs for the metals mercury, silver, and chromium account for 30% of costs projected in the, California Toxics Rule (CTR) economic analysis. However, the long term environmental and economic cost of mercury contamination may far exceed the short term economic savings resulting from an increase in the mercury CCC. This is especially true in California, a mining state that has devoted hundreds of millions of dollars to restoration and enhancement of commercial and sport fisheries by enactment of Proposition 204.

The potential long-term economic and environmental costs of this proposed legislation far exceed any short-term benefits gained by raising the mandatory action level for mercury contamination. A stated goal of the recently passed Proposition 204 legislation is the protection and enhancement of commercial and sport fishing in the State of California. To that end, hundreds of millions of dollars have been committed to water quality improvement and fish habitat restoration. Increasing the permissible mercury limits will not only hinder those goals, but will likely cause irreversible damage to the environment well into the foreseeable future.

(*1) Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California; Proposed Rule. U.S. Environmental Protection Agency, Region Nine; U.S. Government Printing Office: Washington D.C., 1997; Federal Register, 62, 42159-42207.

Response to: CTR-091-002b

The aquatic life criteria have been updated using EPA's peer-reviewed and accepted aquatic life

methodology. The previous 304(a) criteria guidance value was based on an FDA action level for humans, not on aquatic life protection. As such, the previous criteria are not as appropriate to use as the updated criteria proposed in the CTR. The revised criteria are less stringent than the previous criteria.

The human health criteria proposed in the CTR have also been updated using the risk reference dose for methylmercury. The previous 304(a) criteria guidance values were based on the risk reference does for mercury. The revised human health criteria in the CTR are more stringent than the previous human health criteria guidance.

All water quality standards are comprised of three parts: a designated use, and criterion, and an antidegradation policy. The CTR only proposes criteria. The State of California has adopted designated uses for its water bodies (called beneficial uses) in the Regional Water Board Basin Plans. The State has also adopted antidegradation provisions in each of the Regional Board Basin Plans. These provisions require that water quality in a waterbody cannot be degraded (with narrow exceptions as discussed at 40 CFR 131.12(a) (2) which allow a lowering of water quality if the State finds that it is necessary to accommodate important economic or social development). Thus, if a waterbody has achieved a certain level of cleanliness or is in a pristine condition, discharges are not allowed to degrade the water quality. Therefore, no environmental "cost" or degradation will be incurred as a result of any new or revised water quality criteria in the CTR that may be less stringent than a previously adopted objective or a criteria guidance value. Environmental benefits that have been gained in California fisheries or anywhere else cannot be destroyed.

Comment: The City does not agree with the economic analysis. It is incomplete and misrepresents the actual costs and benefits. The analysis does not include costs of expensive AWT to meet more stringent limits based upon the proposed criteria. It does not include the first second, and third order costs to the community, individuals and businesses, of the economic dislocations resulting from huge capital costs, especially for small and economically distressed communities, that divert scarce resources from other priorities or out of the area. It does not include cost impact assessments to low and fixed-income households - ignoring the economic aspects of environmental justice. The benefits assessments make vast unsupported assumptions about the benefits of reductions in constituent concentrations that are barely, if even, measurable, and assigns unrealistic contingent valuations to these assumed benefits. The cost analyses does not follow EPA's own economic assessment guidance (which, itself, is fatally flawed). These points were brought up during the Task Force meetings in 1995 and 1996, but were dismissed outright by EPA. The City hereby raises these issues for the formal record.

The City of Thousand Oaks appreciates the opportunity to comment on the proposed California Toxics Rule.

Sincerely,

Donald H. Nelson Public Works Director

Response to: CTR-009-008b

EPA's own economic assessment guidance (Interim Economic Guidance for Water Quality Standards, EPA-823-B-95-002, March 1995) is intended to assist States and applicants in understanding the economic factors that may be considered, and the types of tests that can be used to determine if a designated use cannot be attained, if a variance can be granted, or if degradation of high-quality water is warranted. In order to remove a designated use or obtain a variance, or if degradation of high-quality water is warranted, the state or discharger must demonstrate that attaining the designated use would result in substantial and widespread economic and social impacts. Although EPA is responsible for approving a State's water quality standards, the State is responsible for interpreting the circumstances of each case and determining where there are substantial and widespread economic and social impacts, or where important social and economic development would be precluded.

Estimating the economic impact of the CTR in California requires a detailed econometric model of the region's economy. EPA did not conduct such an analysis of the rule. However, for a similar toxics rule in

the Great Lakes Basin, an econometric analysis was performed independent of the regulatory impact analysis for the Council of Great Lakes Governors (The Great Lakes Water Quality Initiative: Cost Effective Measures to Enhance Environmental Quality and Regional Competitiveness. DRI/McGraw-Hill, San Francisco, California, July 1993). This analysis showed a minimal impact of the rule on the region's economy for a worst case scenario, a scenario with costs far exceeding those estimated by EPA. Manufacturing output was estimated to fall by between 0.008% and 0.337% over a range of four scenarios evaluated, while personal income loss was estimated at between 0.002% and 0.094% for these scenarios. As a result, the study authors concluded that the impact of the rule on the region's economy would be "nearly imperceptible." Thus, similar controls on toxic pollutants have been shown to be affordable in other regions of the country.

CROSS REFERENCES E-02f

Comment: We also question the estimates of the benefits derived in the draft Economic Analysis, and believe that more recent information specific to California should be collected and used. In particular, for most of the benefits, estimates are based on a comparison with waters which are completely free of contaminants or unimpaired, which is unrealistic. There is also little evaluation of the marginal benefits of the proposed rule (i.e. the benefits that would be realized as a result of marginal changes in contamination levels). While presumably achievement of the full reductions necessary to meet the CTR criteria in ambient waters is EPA's goal, EPA itself acknowledges that few of the benefits of the CTR are likely to be realized through point source controls, and the Agency fails to demonstrate how the water quality criteria promulgated by the CTR will be achieved.

Response to: CTR-035-009b

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

Water quality improvements often involve thresholds such as action levels for fish consumption advisories. However, water quality regulations often contribute only a portion of the improvement needed to surpass a threshold. Although individuals may (or may not) have a willingness to pay for incremental steps toward crossing a threshold, when the threshold is surpassed (e.g., fish consumption advisories are lifted), every action that contributed to the effort should be allocated a portion of the benefits. This was accomplished for the CTR by allocating a portion of the total toxic-free benefits (proportional to the reduction in loadings) to the implementation of point source controls under the CTR.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Comment: Weaknesses in Benefits Analysis

USEPA's benefits analysis is even weaker than its cost evaluation. For example:

* Although there is evidence that the Rule could result in no benefits in the near-term due to long-term environmental persistence of existing contamination, the Analysis does a poor job of highlighting this potential outcome. For example, there is some likelihood that benefits could truly be zero, while under no circumstances will Rule implementation be costless. Likewise, USEPA's use of ranges to express potential benefit values may mislead readers into believing that the estimated high benefits are as likely to be achieved as the low benefits, when in fact the probability that different benefit levels will actually be achieved varies greatly from low to high.

Response to: CTR-035-065b

The range of estimated benefits in part reflects the range in loadings reductions that may result from point source controls given the flexibility in State implementation procedures. The decision as to which

implementation procedures will be employed, and therefore what costs and benefits will result, will be made by state and local entities for specific locations.

Comment: * Most of the benefits estimates are based on a comparison with waters which are "completely unimpaired", "contaminant free," or "completely free of pollutants that may threaten human health." Even if point source reductions are fully obtained, California's waters will remain polluted from non-point sources and contaminants already in the environment for the foreseeable future. In fact, it is unlikely that most state waters will ever be completely unimpaired, and the use and non-use values associated with complete purity may be considerably higher than the more likely outcome of long-term small-scale contamination.

Response to: CTR-035-068

Although the standards established by the CTR apply to all sources, EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

II. Concern: The economic analysis upon which the Rule is based is seriously flawed.

* Estimates of potential costs are severely constrained due to certain assumptions including the assumption that regulatory relief from the Rule will be granted if costs are in excess of certain thresholds.

* Estimates of potential benefits are exaggerated by assuming, that the proposed water quality criteria will actually be achieved in receiving water bodies. This will not result from the implementation of the Rule because the Rule is only addressing permitted discharges to the receiving water bodies.

* The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated.

Response to: CTR-040-008c

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

EPA does not believe that estimates of potential costs are constrained due to assumptions regarding regulatory relief from the Rule. Although EPA considered an industry category cost threshold under the low cost scenario, beyond which a facility was assumed to pursue regulatory relief, no such assumption was used for the high cost scenario. That is, under the high scenario all necessary pollutant reductions were assumed to be achieved through either treatment or a waste control program (e.g. waste minimization pollution prevention).

Comment: Review of EPA's Analysis of Potential Benefits

The benefits analysis overstates benefits by assuming an end (i.e., achievement of the water quality criteria) that will not result from the CTR. The CTR will impact point sources, which EPA acknowledges are only a small portion of the toxic pollutant load (3% of the load to freshwater and 1%-11% of the load

to San Francisco Bay). The major sources of toxic pollutants, nonpoint sources, are not regulated under the Clean Water Act or the CTR.

Response to: CTR-040-043

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Although the standards established by the CTR apply to the waterbody (i.e., inland surface waters and enclosed bays and estuaries), EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

Comment: Review of EPA's Analysis of Potential Benefits

The benefits analysis overstates benefits by assuming an end (i.e., achievement of the water quality criteria) that will not result from the CTR. The CTR will impact point sources, which EPA acknowledges are only a small portion of the toxic pollutant load (3% of the load to freshwater and 1 %-11% of the load to San Francisco Bay). The major sources of toxic pollutants, nonpoint sources, are not regulated under the Clean Water Act or the CTR.

Response to: CTR-041-039

Although the standards established by the CTR apply to all sources, EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Comment: 4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution;

(2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements;

(3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and

(4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule.

The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act.

Response to: CTR-043-004d

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

EPA does not believe that estimates of potential costs are constrained due to assumptions regarding regulatory relief from the Rule. Although EPA considered an industry category cost threshold under the low cost scenario, beyond which a facility was assumed to pursue regulatory relief, no such assumption was used for the high cost scenario. That is, under the high scenario all necessary pollutant reductions were assumed to be achieved through either treatment or a waste control program (e.g. waste minimization pollution prevention).

EPA's EA, which uses many conservative costing assumptions, indicates that the cost of the State implementing water quality standards based on the proposed criteria in the CTR is likely to be below

$100 million per year. Benefits are also estimated to be below $100 million per year. These estimates indicate that the action is not "significant" under E.O. 12866, under the provision concerning annual effects on the economy.

Criteria, by themselves, do not directly impose economic impacts. Criteria are one of three parts of a water quality standard. A water quality standard is comprised of: a criterion, a designated use, and an antidegradation policy. California currently has a narrative criterion stating that there shall be no toxic in toxic amounts. Pursuant to this narrative criterion, which are the basis for this rule. Under this scenario, the rule would have no costs. Under the second scenario, assumes that without this rule, the current permit conditions for point sources would continue in the future. Under this second scenario, EPA assessed a range of potential costs that would be incurred for point sources to meet these criteria - the low end being based on current effluent concentrations, the high end being based on current permit limits. [Pursuant to this analysis, it has been determined that this is not a significant regulatory action subject to OMB review.] See the preamble for the final rule.

The Unfunded Mandates Reform Act of 1995 (UMRA) in general requires federal agencies to assess the effects of their regulatory actions on State and local governments, and on the private sector. The agency must prepare a written statement including a cost-benefit analysis for actions with a "federal mandate" that may result in expenditures to State and local governments, in the aggregate, or to the private sector of $100 million or more in any one year. The CTR does not contain any federal mandate that may result in expenditures by State and local governments, or the private sector, of $100 million or more in any one year. The CTR imposes no direct enforceable duties on the State, local or private sector; rather the rule promulgates water quality criteria which, when combined with State-adopted designated uses and antidegradation requirements, will create water quality standards. The CTR does not directly regulate or affect any entity and therefore is not subject to the requirements of UMRA. See the preamble to the final rule.

Comment: We have reviewed the proposed CTR and offer the following comments:

4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. Additional concerns with the economic analysis are presented in Exhibit F. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act. The City, for example, is a small community having a population of under 50,000 and would be greatly impacted by the proposed rule.

Response to: CTR-044-005d

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

EPA does not believe that estimates of potential costs are constrained due to assumptions regarding regulatory relief from the Rule. Although EPA considered an industry category cost threshold under the low cost scenario, beyond which a facility was assumed to pursue regulatory relief, no such assumption was used for the high cost scenario. That is, under the high scenario all necessary pollutant reductions were assumed to be achieved through either treatment or a waste control program (e.g. waste minimization pollution prevention).

EPA's EA, which uses many conservative costing assumptions, indicates that the cost of the State implementing water quality standards based on the proposed criteria in the CTR is likely to be below $100 million per year. Benefits are also estimated to be below $100 million per year. These estimates indicate that the action is not "significant" under E.O. 12866, under the provision concerning annual effects on the economy.

California currently has a narrative criterion stating that there shall be no toxic in toxic amounts. Pursuant to this narrative criterion, which are the basis for this rule. Under this scenario, the rule would have no costs. Under the second scenario, assumes that without this rule, the current permit conditions for point sources would continue in the future. Under this second scenario, EPA assessed a range of potential costs that would be incurred for point sources to meet these criteria - the low end being based on current effluent concentrations, the high end being based on current permit limits. [Pursuant to this analysis, it has been determined that this is not a significant regulatory action subject to OMB review.] See the preamble for the final rule.

The Unfunded Mandates Reform Act of 1995 (UMRA) in general requires federal agencies to assess the effects of their regulatory actions on State and local governments, and on the private sector. The agency must prepare a written statement including a cost-benefit analysis for actions with a "federal mandate" that may result in expenditures to State and local governments, in the aggregate, or to the private sector of $100 million or more in any one year. The CTR does not contain any federal mandate that may result in expenditures by State and local governments, or the private sector, of $100 million or more in any one year. The CTR imposes no direct enforceable duties on the State, local or private sector; rather the rule

promulgates water quality criteria which, when combined with State-adopted designated uses and antidegradation requirements, will create water quality standards. The CTR does not directly regulate or affect any entity and therefore is not subject to the requirements of UMRA. See preamble to the final rule.

Comment: Page 42190, bottom of the first and all of the second and third columns, discuss benefits. This discussion on the benefits of achieving these criteria is superficial, at best. There is no way to reliably estimate the improvement in the real water quality - beneficial uses arising from the adoption of these criteria since the database needed to relate the exceedances of the criteria to real water quality use-impairments does not exist. Many of the exceedances that are now occurring are "administrative" exceedances related to overly protective approaches dictated by the US EPA that have been and will likely continue to be used in implementing the criteria into discharge limits.

Response to: CTR-061-018

EPA defined toxic-impaired waters as waters rated medium or poor quality for at least one or more toxic pollutant or group of pollutants. EPA acknowledged that this definition may result in an overestimate of toxic-impairment (EA Chapter 8). However, the rating of these waters corresponds to EPA's categories of

'not fully supporting' and 'partially supporting' designated uses. The existence of waters not supporting and only partially supporting designated uses is indicative of the need for and benefits associated with pollution controls.

Comment: 9. ECONOMIC ANALYSIS

The document entitled "Economic Analysis of the Proposed California Water Quality Toxics Rule" examines in large part the benefits and costs of changes in water quality due to point source dischargers implementation actions using the CTR-based water quality standards. This comment addresses the approach to quantifying benefits know as "passive use values" held by the public. We believe that a "rule of thumb" ratio of 50% or 0.5 for passive use values to active use values is overly conservative and leads to a significant understatement of the potential benefits of water quality improvements.

The CDFG has recently hired Dr. John Loomis (Colorado State University, Fort Collins) to establish such a passive use to active use value ratio, for small scale changes in the quality and/or quantity of natural resources and the services they provide to the public. Dr. Loomis conducts a comprehensive review of the resource economics literature and provided a conservative estimate of 1.43 versus the 0.50 used in the Economic Analysis performed for the CTR. We believe that should the US EPA attempt to quantify passive use benefits of the CTR, that a more appropriate use value ratio (or rule of thumb) is 1.43 rather than the 0.5 currently used in the analysis.

Response to: CTR-026-009

EPA reviewed the recent review by Dr. John Loomis referenced by the commenter (Loomis, 1997). Dr. Loomis conducted this review for application to the California Type A Model for simplified damage assessments under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980.

Dr. Loomis compiled studies from several previous reviews, including Fisher and Raucher (1984), Bishop et al. (1993), and Brown (1993). Each study used different approaches for calculating the ratio of passive use to use values, including comparison of use and passive use values, relying on respondents to prorate their willingness to pay between use and passive use components, and obtaining values when respondents are asked to assume active use is zero. Dr. Loomis notes that the prorating approach can yield higher estimates of the ratio than other approaches. He calculated his ratio of 1.43 by averaging across ratios calculated by all methods employed, after excluding outliers (three studies showing ratios of greater than 6) and studies involving unique resources or endangered species (studies involving bald eagles, grizzly bears, whooping cranes, and Mono Lake were not deemed appropriate for application to small oil spills).

As described in the EA accompanying the proposed CTR, in applying a rule of thumb such as the ratio of

passive use to use values, it is important to consider the extent to which the primary research efforts have evaluated resources and changes in resource conditions that are reasonably comparable to the CTR (see Chapter 8 EA). EPA considered the studies evaluated by Fisher and Raucher (1984) and which indicated a ratio of 0.5 more applicable to the CTR than studies indicating potentially higher ratios. For example, a study by Sanders et al. (1990) indicated a ratio of approximately 1.8 or 1.9, however, the results are based on the value of preserving several free-flowing river segments in Colorado from the development of dams and other major, irreversible hydrological modifications.

Dr. Loomis' review also includes studies that value environmental changes substantially different from those expected under the CTR. For example, a study by Haefele, et al (1992) estimates the total value of forest quality in high elevation spruce forests. This study contributes ratios of 10.74 and 6.7 to Dr. Loomis' review. A study by King et al (1988) , which contributed a ratio of 7.57, estimated the value of a herd of desert bighorn sheep. In addition, Dr. Loomis excluded studies of unique resources and endangered species (e.g., bald eagles) because of a lack of applicability to small oil spills; unique resources and endangered species are of relevance to the CTR.

Dr. Loomis' review of the ratio EPA applied to estimate passive use benefits for the CTR indicates that this ratio may be conservatively estimated. However, for the CTR, EPA used a less conservative application of the ratio compared to previous applications. That is, the selected ratio is typically multiplied by use values (e.g., recreational angling values for the CTR, nonconsumptive use values for the CERCLA Type A Model) to estimate passive use values. This application may be conservative because, in effect, passive use values are only being counted for resource users. To include passive use values for nonusers in its analysis of benefits for the CTR, EPA estimated passive use values for nonangling California households.

Comment: pp. 8-24 - 8-27 (U.S. EPA, 1997a) -- Passive Use Benefits The Economic Analysis assumes that a substantial portion of the benefits would accrue from passive use benefits (about 60% for the low end estimate and 70% for the high end estimate). We believe that, based on the number and type of assumptions required, and the reliance on studies of other types of passive use benefits (e.g. avoidance of mining activities or building a dam), these estimates are extremely tenuous. None of the studies cited examined the marginal benefits of incremental improvements in concentrations of toxic pollutants, nor were any of the studies based in California. Furthermore, it does not appear that EPA apportioned the passive use benefits attributable to improvements in water quality that will occur as a result of the CTR, as was done for other benefit categories. We recommend that the inclusion of quantitative estimates be reconsidered for passive use benefits, and, at most, only that portion representing the benefits attributable to the CTR be included.

Response to: CTR-035-055

As described in the EA (Chapter 8), research provides empirical evidence of the passive use values associated with improved water quality and fisheries. Research also indicates that these values are at least half as great as recreational values, such that if they are potentially applicable to a policy action, providing a rough approximation is preferable, with proper caveats, to omitting them from the analysis of benefits and costs. EPA believes that the studies used to calculate the ratio of passive use to use value are applicable to the CTR (see also comment and response CTR-026-009).

Therefore, EPA applies a ratio of .5 to obtain an estimate of passive use values for those households that have active recreational anglers. Based on a review of the literature, EPA believes that non-angling household do indeed have a passive use value. To determine a lower-bound estimate of passive use values for non-angling households, EPA assumed that the value may be 30% of the value for angling households. For analysis of the final CTR, EPA revised the upper-bound estimate assuming that the passive use value of non-angling households may be 90% of those for angling households. This revision is based on a study by Loomis et al. (1991), who estimated the benefits of improved fishery, wetland, and waterfowl resources in the San Joaquin Valley to users and nonusers residing in California.

By multiplying a ratio of passive use to use value by recreational fishing values, which EPA apportioned to reflect the relative contribution of point sources, EPA also accounted for attribution in its estimate of passive use values.

Comment: EPA's estimate of passive use benefits ($36.3 million annually under the high-end scenario and 70% of the total estimated benefits) is erroneous. First, it is based on an unsupported assumption that non-use values (e.g., property values) are depressed in California because of pollution. Second, it is based on the assumption that the water quality criteria will be achieved as a result of the CTR, which as previously stated, is not the case.

Response to: CTR-040-047

As described in the EA (Chapter 8), research provides empirical evidence of the passive use values associated with improved water quality and fisheries. EPA believes that these studies are applicable to the CTR. EPA also believes that its assessment of toxic impairment of California, based on data and information compiled by the State Water Resource Control Boards, is reasonably accurate.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of the State's actions that may control other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Comment: The Center for Marine Conservation (CMC) is a nationwide, nonprofit advocacy group dedicated to the conservation and enhancement of coastal and ocean life and resources. CMC submits these comments on behalf of its 16,000 members in California and over 120,000 members nationwide.

CMC applauds EPA's efforts to bring California into compliance with the Clean Water Act 303(c)(2)(B). Implementing numeric criteria that will protect the beneficial uses of California's waters is of great importance to the health of coastal and marine ecosystems, and so to CMC and its members. The reliance in many areas of the state on narrative criteria threatens the health of most of the state's waters, thereby impacting both human health and the health of the state's economy that relies on clean water.

While CMC strongly supports the swift adoption of an Enclosed Bays and Estuaries Plan and an Inland Surface Waters Plan that contain numeric criteria for toxic pollutants, CMC also is concerned that many of the specific criteria contained in the proposed rule are weaker than those contained in published guidance. CMC also believes that the proposed rule can better protect certain subpopulations from harm caused by consumption of contaminated fish and shellfish. Finally, CMC is concerned that the economic analysis of the proposed rule over-emphasizes costs and under-reports the many benefits of improving water. quality throughout the state. These three points are reviewed below.

The Proposed Rule's Economic Analysis Over-Emphasizes Costs and Under reports the Benefits of Improving Water Quality Throughout the State

By EPA's own admission, the proposed rule's economic analysis over-reports costs and under-reports benefits. Specifically, the proposed rule states that "cost estimates for both scenarios, but especially for the high-end scenario, may be overstated because the analysis tended to use conservative assumptions."(*8) Conversely, "numerous categories of potential or likely benefits have been omitted" from the analysis, and these omitted benefits "are likely to be significant contributors" to an "appreciable underestimation" of the overall benefits of the rule.(*9) Categories left out of the benefits analysis include improvements in water-related, non-fishing recreation, improvements in land recreation, and improvements in human health resulting from reducing non-cancer risk."(*10)

CMC believes it is possible to quantify many of these omitted benefits to obtain a more accurate picture of the importance of this rule. For example, a recent Santa Monica Bay Restoration Project Study found that people swimming close to storm drains face a 50% increase in their risk of contracting a variety of non-cancer ills such as gastroenteritis and ear and other infections. At a minimum, EPA's analysis could capture the benefits of improved water quality in terms of avoided sick days and avoided medical costs for such users.

CMC also believes that the economics analysis should consider other categories of benefits not mentioned at all in the proposed rule. For example, Governor Wilson's March 1997 planning document, California's Ocean Resources: An Agenda for the Future, finds that industries that depend on healthy coastal and ocean waters contribute $17.3 billion to the state's economy each year and support 370,000 jobs. The majority of this total, $10 billion, is from tourism, which is not mentioned in the proposed rule but which could benefit greatly from improved water quality. Such omitted benefits should be examined in order to have a more balanced economic analysis.

The adequacy of the proposed rule's economic analysis is important to the long-term implementation of the rule. As reported by EPA, "[t]he allegation that the State did not sufficiently consider economics when adopting Water quality objectives ... was an important issue in the litigation" that resulted in the rescission of the Enclosed Bays and Estuaries Plan and the Inland Surface Waters Plan.(*11) Moreover, an accurate description of the benefits of the proposed rule is critical to obtaining funding and public support for swift implementation of the numeric criteria. CMC thus requests that the benefits analysis be updated where possible to parallel the acknowledged "conservative" approach used in estimating the costs of the proposed rule.

(*9) Id. at 42190.

(*10) Id.

(*11) Id. at 42165.

Response to: CTR-029-004b

EPA acknowledges that it was unable to monetize all categories of potential benefits from the rule. EPA provided a qualitative description of the expected benefits and those unmonetized benefits that may contribute most substantially to total benefits.

Illnesses contracted from swimming, such as those evaluated in the study of storm water drains in Santa Monica Bay, typically result from exposure to pathogens that will not be regulated under the CTR. Noncancer effects from the toxic pollutants that will be reduced by the rule are difficult to quantify because of a lack of information on the link between concentrations in the environment and potential cases of systemic effects.

Secondary benefits (e.g., tourism) or economic impacts embody the successive rounds of spending in an economy that result from the primary benefits of a regulation. These secondary benefits (or impacts) are estimated based on the analysis of data on interindustry linkages within a region. Although these impacts may be of relevance to policymakers, the inclusion of secondary benefits may be inappropriate. This is because under conditions of reasonably full employment, the resources placed into support services (or diverted from complying entities) would be diverted from (or redirected toward) other productive purposes (i.e., net jobs would not be created or lost for otherwise unemployed individuals but, rather, workers would be drawn to or away from other jobs). Thus, these secondary impacts represent a transfer or redistribution of resources rather than changes in real economic activity.

The benefits of water quality improvements are highly site specific and difficult to monetize due to

limitations in benefits methodology and accurate data on society's values for these improvements. For example, there are currently few means of linking consumption of toxic contaminants by humans with cases of systemic effects (as opposed to cancer effects, for which dose-response curves have been estimated). As another example, the contingent valuation (CV) is the only method for estimating passive use values, and CV surveys require substantial resources to conduct. As a result, there is limited data and information with which to estimate the benefits of the proposed rule. Since these values are not known, a parallel conservative approach is not possible. EPA presented the information on the limitations of the analysis (e.g., costs may be overstated and benefits may be understated) to assist decisionmakers in evaluating the results.

Comment: Comment #7: General Benefit Analysis Concerns

The benefit analysis undertaken by EPA uses old, out-of-state data which does not appear applicable to California. A major concern with this analysis is that the benefit recipients are only a subset of those impacted by the costs. Another is that the benefits accrue to the public at large; costs, on the other hand, to the extent that CTR-implementation costs are borne by Indirect Dischargers (as assumed by EPA in the copper situation) accrue to businesses.

Further, the benefit measurements of "angling day" are only useful if they represent a net increase in fishing activity -- if all that improving waterway quality does is create additional sites where safe fishing can occur, without increasing the overall amount of fishing that occurs, there is no net gain, there is only substitution between comparable sites. The value of benefits which occur because of substitution between fishing sites must be subtracted from the value which occurs from increased fishing. This has not been done in the EPA analysis, thus benefits are overstated.

Further, no stratification is evident to account for importation of out-of-state fishers -- including benefit value of attracting new anglers from other states to California fishing sites is irrelevant to an analysis of costs/benefits of implementing the CTR for California.

Questions for EPA on Comment #7:

Q.7 - 1) If the concerns stated above were appropriately addressed, what would be the impact on EPA's benefits analysis? Our concern relates to the need to examine levels of regulation in comparison to benefits obtained, i.e. cost-effectiveness.

Q.7 - 2) Executive Order 12866, in recognition that quantification of benefits is very difficult, is quite

explicit about addressing qualitative benefits wherever possible why wasn't that done in this analysis?

Response to: CTR-092-023a

EPA was not able to locate more relevant or more recent data or research for the analysis. EPA solicited relevant data and information in the EA and proposal. In addition, in response to comments, EPA conducted an extensive search of the literature for any additional recent, California-specific data or information applicable to the benefits analysis. EPA reviewed and evaluated all data and information submissions, and the results of the literature search, and revised the EA and CTR as appropriate prior to promulgating the final rule.

Although it is true that the direct costs of the regulation are borne by municipal and industrial dischargers while the benefits accrue to the public at large, it is also true that in generating the discharges, the benefits (cost savings) accrued to businesses and municipalities while the costs (decreased utility associated with water resources) were borne by the public. Ultimately, benefits and costs are borne throughout society (e.g., costs are borne directly by municipal and industrial dischargers but indirectly by the public who pays for their products and services).

EPA acknowledged that increased angling activity at sites experiencing reductions in toxic contaminants may reflect a shift in activity from substitute sites rather than a net increase. Because EPA could not account for substitute sites in this analysis, EPA estimated lower bound benefits of $0 (i.e., assuming no net increases in activity; see EA, Chapter 8).

EPA's estimate of the relevant angling population is based on resident California anglers (see Analysis of the Potential Benefits Related to Implementation of the California Toxics Rule, Draft, December 20, 1996, pp. 3-23, 3-35 to 3-36).

EPA revised its economic analysis in response to comments and to reflect any new data or changes to the proposal.

(EPA revised.....already part of text)....The estimated cost-effectiveness of the rule is expected to range from $22/lb-eq to $31/lb-eq. EPA expects the total annual, monetized benefits from implementation of the CTR to range from $8.7 to $40.8 million dollars.

Chapter 6 of the EA (Qualitative Assessment of Potential Ecological Benefits) provides a qualitative discussion of potential ecological benefits. EPA also provided a qualitative discussion of important benefit categories that it was not able to quantify or monetize (see the EA that accompanied the proposed rule, Chapter 8).

Comment: We also question the estimates of the benefits derived in the draft Economic Analysis, and believe that more recent information specific to California should be collected and used. In particular, for most of the benefits, estimates are based on a comparison with waters which are completely free of contaminants or unimpaired, which is unrealistic. There is also little evaluation of the marginal benefits of the proposed rule (i.e. the benefits that would be realized as a result of marginal changes in contamination levels). While presumably achievement of the full reductions necessary to meet the CTR criteria in ambient waters is EPA's goal, EPA itself acknowledges that few of the benefits of the CTR are likely to be realized through point source controls, and the Agency fails to demonstrate how the water quality criteria promulgated by the CTR will be achieved.

Response to: CTR-035-009a

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

Water quality improvements often involve thresholds such as action levels for fish consumption

advisories. However, water quality regulations often contribute only a portion of the improvement needed to surpass a threshold. Although individuals may (or may not) have a willingness to pay for incremental steps toward crossing a threshold, when the threshold is surpassed (e.g., fish consumption advisories are lifted), every action that contributed to the effort should be allocated a portion of the benefits. This was accomplished for the CTR by allocating a portion of the total toxic-free benefits (proportional to the reduction in loadings) to the implementation of point source controls under the CTR.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Comment: C. Benefits Analysis pp. 5-7 - 5-8 (U.S. EPA, 1997a) -- Attribution of Benefits to the Control of Point Sources

We applaud EPA's effort to analyze and report the proportion of the total benefits that might accrue due to the implementation of controls on point source NPDES dischargers in the benefits analysis (although we believe that this apportionment should have been carried through to the estimates of passive use benefits). We believe that it is appropriate to state the benefits that can be attributed to the estimated expenditures. We recognize, however, that there are many limitations in this approach, and that better data are needed. For instance, the pollutant loadings data used in this analysis were old and outdated (specifically, the Davis and NOAA studies contained data that are 10-15 years old). We urge EPA to update these studies with more recent data for the final Economic Analysis.

We believe that the benefits analysis illustrates that, in many instances, point source controls will not produce significant benefits. For instance, this is illustrated by the fact that the projected health benefits of the CTR in reducing both cancer and baseline systemic risks are minimal (see pp, 8-11 - 8-16, (U.S. EPA, 1997a)). Another example is illustrated by an examination of those water bodies for which fish consumption advisories have been issued. For those included on the State's 303(d) list, except for San Francisco Bay, the causes of impairment are largely listed by the SWRCB as nonpoint sources, including mining or resource extraction, agricultural drainage or runoff, urban stormwater runoff, or other unspecified nonpoint sources (SWRCB, 1996).

In addition, the analysis of benefits should highlight more clearly the fact that there may be little or no benefits in the near-term due to long-term environmental persistence of existing contamination. As EPA itself acknowledges on p. 5-8 (U.S. EPA, 1997a), "historical loads may, in some instances, be the predominant source of toxics-related water quality problems. In such instances, efforts to control current

discharges may be of relatively limited effectiveness and value." It is well-documented that some substances, such as DDT and PCBs, which have been banned for two or more decades, still persist in the environment; thus, the likelihood of the CTR substantially reducing loadings and producing benefits is minimal.

Response to: CTR-035-051b

As described in the EA (Chapter 8), research provides empirical evidence of the passive use values associated with improved water quality and fisheries. Research also indicates that these values are at least half as great as recreational values, such that if they are potentially applicable to a policy action, providing a rough approximation is preferable, with proper caveats, to omitting them from the analysis of benefits and costs. EPA believes that the studies used to calculate the ratio of passive use to use value are applicable to the CTR (see also comment and response CTR-029-009).

Therefore, EPA applies a ratio of .5 to obtain an estimate of passive use values for those households that have active recreational anglers. Based on a review of the literature, on studies that estimate resource values fo users and non-users (see the revised economic analysis), EPA believes that non-angling household do indeed have a passive use value. To determine a lower-bound estimate of passive use values for non-angling households, EPA assumed that the value may be 30% of the value for angling households. For analysis of the final CTR, EPA revised the upper-bound estimate assuming that the passive use value of non-angling households may be 90% of those for angling households. This revision is based on a study by Loomis et al. (1991), who estimated the benefits of improved fishery, wetland, and waterfowl resources in the San Joaquin Valley to users and nonusers residing in California.

By multiplying a ratio of passive use to use value by recreational fishing values, which EPA apportioned to reflect the relative contribution of point sources, EPA also accounted for attribution in its estimate of passive use values.

For the EA that accompanied the proposal, EPA conducted an extensive search of the literature for more recent data or information related to the relative contributions of various sources to water quality impairments. In the EA accompanying the proposal, EPA solicited additional data, however, none was received. In revising the EA for the final rulemaking, EPA conducted an additional extensive search of the literature and research efforts at California universities for relevant information. EPA has incorporated any new information into the revised EA for the final rule.

The standards established in the CTR apply to all waterbodies. EPA currently only applies water quality based effluent limits to point sources, and thus the estimate of post-regulation risk levels reflect only the potential impact of controls on point sources. However, controls will also be required of other sources in the future. As controls on other sources are implemented (e.g., remediation of contaminated sediments; best management practices to control storm water discharges and runoff from agricultural land), EPA expects that concentrations in fish tissue will decline further and that the standards established by the CTR to protect human health can be achieved.

EPA also believes that the risk reducing impact of the regulation on point sources may not be fully illustrated by EPA's analysis which reflects only a small sample of point source dischargers. That is, although baseline risk levels are based on actual fish tissue concentrations, post-regulation risk levels are estimated by examining the potential for reducing loadings at a sample of facilities. Pollutants responsible for much of the baseline health risk at specific sites, such as popular fishing areas in San Francisco Bay, may be found in point sources effluents, however, the facilities discharging these pollutants may not be included in the sample.

Although the standards established by the CTR apply to all sources, EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

EPA recognizes the persistence of some of the substances addressed by the CTR (e.g., DDT and PCBs) and the impact of this persistence on the realization of benefits. In the EA (Chapter 9), EPA accounted for this lag by assuming 10- and 20-year phase-in periods for benefits in its comparison of present value benefits and costs.

In addition, EPA believes that point source controls can factor into pollutant reduction scenarios, although the cost-effectiveness of point and nonpoint source controls are likely to be highly site specific. Potential "hidden" loads (contaminant concentrations which are not currently measured because they are below detection levels) from point sources may also be occurring and may increase the potential benefits of point source controls. In addition, point source loadings reductions will reduce future sediment contamination and, thereby, reduce the need for costly site-specific sediment remediation in the future. Therefore, the CTR can be viewed as both reducing current environmental risks (yielding benefits) by reducing current loadings, and reducing future environmental cleanup costs.

Comment: Regarding the benefits analysis, EPA should use more recent information and information specific to the state of California to develop their assessment of the value of the benefits resulting from the implementation of the CTR. We believe that by considering these two factors alone, the benefit value is more likely to be on the low side of the $1.5 to $51.7 million/year estimate provided by EPA. Also, a consideration which was not included as an adverse side-effect of enhancing beneficial uses of inland surface waters and enclosed bays and estuaries is the increased pollutant loading along the margins of the water body linked to increased recreational activities (e.g. increased pollution associated with recreational boating).

Response to: CTR-056-021

EPA was not able to locate more relevant or more recent data or research for the analysis. EPA solicited relevant data and information in the EA and proposal. In addition, in response to comments, EPA conducted an extensive search of the literature for any additional recent, California-specific data or information applicable to the benefits analysis. EPA reviewed and evaluated all data and information submissions, and the results of the literature search, and revised the EA and CTR as appropriate prior to promulgating the final rule.

EPA believes that the environmental impacts of the pollutants regulated by the CTR far exceed those associated with recreational boating, and that pollutants generated by boating are already regulated to ensure minimal impacts on water resources.

Comment: C. Benefits Analysis pp. 5-7 - 5-8 (U.S. EPA, 1997a) -- Attribution of Benefits to the Control of Point Sources

We applaud EPA's effort to analyze and report the proportion of the total benefits that might accrue due to the implementation of controls on point source NPDES dischargers in the benefits analysis (although we believe that this apportionment should have been carried through to the estimates of passive use benefits). We believe that it is appropriate to state the benefits that can be attributed to the estimated expenditures. We recognize, however, that there are many limitations in this approach, and that better data are needed. For instance, the pollutant loadings data used in this analysis were old and outdated (specifically, the Davis and NOAA studies contained data that are 10-15 years old). We urge EPA to update these studies with more recent data for the final Economic Analysis.

We believe that the benefits analysis illustrates that, in many instances, point source controls will not produce significant benefits. For instance, this is illustrated by the fact that the projected health benefits of the CTR in reducing both cancer and baseline systemic risks are minimal (see pp, 8-11 - 8-16, (U.S. EPA, 1997a)). Another example is illustrated by an examination of those water bodies for which fish consumption advisories have been issued. For those included on the State's 303(d) list, except for San Francisco Bay, the causes of impairment are largely listed by the SWRCB as nonpoint sources, including mining or resource extraction, agricultural drainage or runoff, urban stormwater runoff, or other unspecified nonpoint sources (SWRCB, 1996).

In addition, the analysis of benefits should highlight more clearly the fact that there may be little or no benefits in the near-term due to long-term environmental persistence of existing contamination. As EPA itself acknowledges on p. 5-8 (U.S. EPA, 1997a), "historical loads may, in some instances, be the predominant source of toxics-related water quality problems. In such instances, efforts to control current discharges may be of relatively limited effectiveness and value." It is well-documented that some substances, such as DDT and PCBs, which have been banned for two or more decades, still persist in the environment; thus, the likelihood of the CTR substantially reducing loadings and producing benefits is minimal.

Response to: CTR-035-051a

As described in the EA (Chapter 8), research provides empirical evidence of the passive use values associated with improved water quality and fisheries. Research also indicates that these values are at least half as great as recreational values, such that if they are potentially applicable to a policy action,

providing a rough approximation is preferable, with proper caveats, to omitting them from the analysis of benefits and costs. EPA believes that the studies used to calculate the ratio of passive use to use value are applicable to the CTR (see also comment and response CTR-026-009).

Therefore, EPA applies a ratio of .5 to obtain an estimate of passive use values for those households that have active recreational anglers. Based on a review of the literature, EPA believes that non-angling household do indeed have a passive use value. To determine a lower-bound estimate of passive use values for non-angling households, EPA assumed that the value may be 30% of the value for angling households. For analysis of the final CTR, EPA revised the upper-bound estimate assuming that the passive use value of non-angling households may be 90% of those for angling households. This revision is based on a study by Loomis et al. (1991), who estimated the benefits of improved fishery, wetland, and waterfowl resources in the San Joaquin Valley to users and nonusers residing in California.

By multiplying a ratio of passive use to use value by recreational fishing values, which EPA apportioned to reflect the relative contribution of point sources, EPA also accounted for attribution in its estimate of passive use values.

For the EA that accompanied the proposal, EPA conducted an extensive search of the literature for more recent data or information related to the relative contributions of various sources to water quality impairments. In the EA accompanying the proposal, EPA solicited additional data, however, none was received. In revising the EA for the final rulemaking, EPA conducted an additional extensive search of the literature and research efforts at California universities for relevant information. EPA has incorporated any new information into the revised EA for the final rule.

The standards established in the CTR apply to all California inland surface waters and enclosed bays and estuaries. EPA currently only applies water quality based effluent limits to point sources, and thus the estimate of post-regulation risk levels reflect only the potential impact of controls on point sources. However, controls will also be required of other sources in the future. As controls on other sources are implemented (e.g., remediation of contaminated sediments; best management practices to control storm water discharges and runoff from agricultural land), EPA expects that concentrations in fish tissue will decline further and that the standards established by the CTR to protect human health can be achieved.

EPA also believes that the risk reducing impact of the regulation on point sources may not be fully illustrated by EPA's analysis which reflects only a small sample of point source dischargers. That is, although baseline risk levels are based on actual fish tissue concentrations, post-regulation risk levels are estimated by examining the potential for reducing loadings at a sample of facilities. Pollutants responsible for much of the baseline health risk at specific sites, such as popular fishing areas in San Francisco Bay, may be found in point sources effluents, however, the facilities discharging these pollutants may not be included in the sample.

Although the standards established by the CTR apply to all sources, EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

EPA recognizes the persistence of some of the substances addressed by the CTR (e.g., DDT and PCBs) and the impact of this persistence on the realization of benefits. In the EA (Chapter 9), EPA accounted for this lag by assuming 10- and 20-year phase-in periods for benefits in its comparison of present value

benefits and costs.

In addition, EPA believes that point source controls can factor into pollutant reduction scenarios, although the cost-effectiveness of point and nonpoint source controls are likely to be highly site specific. Potential "hidden" loads (contaminant concentrations which are not currently measured because they are below detection levels) from point sources may also be occurring and may increase the potential benefits of point source controls. In addition, point source loadings reductions will reduce future sediment contamination and, thereby, reduce the need for costly site-specific sediment remediation in the future. Therefore, the CTR can be viewed as both reducing current environmental risks (yielding benefits) by reducing current loadings, and reducing future environmental cleanup costs.

Comment: * The Analysis suggests that the proposed reductions in point source discharges may not result in any benefits. As indicated by USEPA, "...the estimates presented here do not make direct causal links between point source controls and the stated benefits..."

Response to: CTR-035-066

EPA recognizes that the benefits of the rule will not occur immediately, and has estimated lags in the realization of benefits. However, EPA believes that the standards established by the CTR can be achieved through point source controls and will result in attaining designated uses of the water bodies, and that the estimated benefits are illustrative of the types and potential benefits to be achieved from attaining these uses.

CROSS REFERENCES

Comment: EPA's estimate of reduced cancer benefits ($5.3 million annually under the high-end scenario)

is suspect because the analysis does not show that the pollutant upon which the benefits are based (DDT) will be reduced (or sufficiently reduced) as a result of the CTR to lead to the estimated reduction in cancer cases.

Response to: CTR-040-044

To calculate potential human health risk reduction benefits, EPA first calculated baseline risk levels using actual contaminant concentrations found in fish tissue. EPA then multiplied the baseline risk levels by the estimated reduction in loadings expected to result from the implementation of point source controls and by the relative contribution of point source loadings to total loadings. For DDT, EPA estimated a 68.8% reduction in point source loadings under the high end cost estimate and a 0% reduction in point source loadings under the low end cost estimate. EPA's estimate of human health benefits reflects these estimated reductions. For example, potential cancer-related benefits to recreational anglers range from $0 to $4.2 million for freshwater resources and total $0 for San Francisco Bay.

In addition, the risk reducing impact of the regulation on point sources may not be fully illustrated by EPA's analysis which reflects only a small sample of point source dischargers. That is, although baseline risk levels are based on actual fish tissue concentrations, post-regulation risk levels are estimated by examining the potential for reducing loadings at a sample of facilities. Pollutants responsible for much of the baseline health risk at specific sites, such as popular fishing areas in San Francisco Bay, may be found in point source effluents, however, the facilities discharging these pollutants may not be included in the sample.

Comment: EPA's estimate of reduced cancer benefits ($5.3 million annually under the high-end scenario) is suspect because the analysis does not show that the pollutant upon which the benefits are based (DDT) will be reduced (or sufficiently reduced) as a result of the CTR to lead to the estimated reduction in cancer cases.

Response to: CTR-041-040

To calculate potential human health risk reduction benefits, EPA first calculated baseline risk levels using actual contaminant concentrations found in fish tissue. EPA then multiplied the baseline risk levels by the estimated reduction in loadings expected to result from the implementation of point source controls and by the relative contribution of point source loadings to total loadings. For DDT, EPA estimated a 68.8% reduction in point source loadings under the high end cost estimate and a 0% reduction in point source loadings under the low end cost estimate. EPA's estimate of human health benefits reflects these estimated reductions. For example, potential cancer-related benefits to recreational

anglers range from $0 to $4.2 million for freshwater resources and total $0 for San Francisco Bay.

In addition, the risk reducing impact of the regulation on point sources may not be fully illustrated by EPA's analysis which reflects only a small sample of point source dischargers. That is, although baseline risk levels are based on actual fish tissue concentrations, post-regulation risk levels are estimated by examining the potential for reducing loadings at a sample of facilities. Pollutants responsible for much of the baseline health risk at specific sites, such as popular fishing areas in San Francisco Bay, may be found in point source effluents, however, the facilities discharging these pollutants may not be included in the sample.

Comment: pp. 7-12 - 7-14 (U.S. EPA, 1997c) -- Extrapolation from Non-Enclosed Bays to Enclosed Bays

EPA assumed that the data from the 1988 NOAA study on 5 bays (San Diego, Humboldt, Monterey, Santa Monica, and San Pedro) could be readily extrapolated for enclosed bays. We believe that there are serious flaws in this approach, and that the data for the non-enclosed bays should be removed from the data set. We are most familiar with Santa Monica Bay, which has been heavily studied, including several specialized studies since that time. The basic problem with including data such as that for Santa Monica Bay in the data set is that the mass loading data are undoubtedly dominated by data for 2 large ocean discharge POTWs (each greater than or equal to 350 MGD), which would likely not be allowed to discharge into enclosed bays, thus skewing the assumptions towards a greater influence from POTWs on these bays than really occurs. If EPA examines the SWRCB's 1996 303(d) list, information is provided for many of these water bodies indicating what types of discharges are the likely sources of the pollution problems, which we believe will confirm this.

Response to: CTR-035-053

The NOAA data included five bays (San Diego, Humboldt, Monterey, Santa Monica, and San Pedro), two of which are actually covered by the CTR (San Diego and Humboldt). EPA assumed that the data for the nonenclosed bays generally will be applicable to enclosed bays. If EPA had excluded those bays not covered by the rule, the attribution assumption for point sources would actually be higher (see EA, p. 7-4). For example, for urban bays, the toxic-weighted average contribution of point sources is higher for the enclosed bay covered by the rule (San Diego Bay; 91%) compared to the nonenclosed bays (Santa Monica and San Pedro, at 88% and 83%, respectively). EPA employed toxicity-weighting to estimate relative source contribution because the toxicity of the discharge, more than volume, will influence its impact on receiving waters. The California 1996 303(d) report lists both point and nonpoint sources as probable sources of pollution for Santa Monica Bay. The list of pollutants and stressors for Santa Monica Bay includes metals, DDT, and PCBs.

Comment: * Even more than the cost analysis, benefits would appear to be site-specific. Uses of water bodies varies considerable, as does the contribution of point, non-point, and natural sources to toxic contamination. As a result, there is likely a mismatch between the total estimated benefits, and the distribution of these benefits throughout the state, as well as the costs of obtaining water body-specific benefits (e.g., costs could be disproportionately felt in areas with little benefit).

For example, USEPA's assumptions about urban bays other than San Francisco are based on a National Oceanic and Atmospheric Administration (NOAA) report that examined five bays: Humboldt, Monterey, San Diego, San Pedro, and Santa Monica, of which only Humboldt and San Diego are covered by the Rule. USEPA assumption that the data for the non-enclosed bays is generally applicable to enclosed bays may not be supportable as a result of differences in dilution factors and the contribution of non-point sources.

Response to: CTR-035-070

EPA agrees that benefits are likely to be highly site specific. However, sites likely to experience a disproportionate share of the benefits are also likely to incur a disproportionate share of the costs.

In addition, once water quality standards are in place, sites that are currently less impacted by toxic pollutants may experience cost savings by preventing future cleanup costs. That is, it may be more cost-effective to prevent toxic pollutants from entering surface waters than to clean up and remediate the impacts once toxic pollutants are released. However, should the State determine through a total maximum daily load (TMDL) allocation that controls on nonpoint sources are a more cost-effective approach to achieving standards, the State can redistribute the allocations through the TMDL process.

The NOAA data included five bays (San Diego, Humboldt, Monterey, Santa Monica, and San Pedro), two of which are actually covered by the CTR (San Diego and Humboldt). EPA assumed that the data for the nonenclosed bays generally will be applicable to enclosed bays. If EPA had excluded those bays not covered by the rule, the attribution assumption for point sources would actually be higher (see EA, p. 7-4). For example, for urban bays, the toxic-weighted average contribution of point sources is higher for the enclosed bay covered by the rule (San Diego Bay; 91%) compared to the nonenclosed bays (Santa Monica and San Pedro, at 88% and 83%, respectively). EPA employed toxicity-weighting to estimate relative source contribution because the toxicity of the discharge, more than volume, will influence its impact on receiving waters. Comment: p. 8-18 (U.S. EPA, 1997a) --Assumptions Regarding Impaired Waters EPA explains on p. 8-18 how it extrapolated from the State's 305(b) Report to create estimates for all waters. We believe that EPA should have consulted the SWRCB to determine the general locations of unassessed/unmonitored waters so that logical assumptions could be made. Assumptions about water quality conditions would be very different, for instance, if they are mostly Central Valley agricultural drains than if they are streams in the Sierra Nevada or northern California mountains.

Response to: CTR-035-054

EPA did consult with SWRCB staff concerning appropriate assumptions about unassessed waters. The SWRCB considered EPA's assumptions reasonable for estimating the extent of toxic impairment in unassessed waters.

Comment: The value of recreational angling was multiplied by 50% to obtain $4.3 million annually for passive use benefits. The Wisconsin study, therefore, was the basis for $12.9 million, or 2.5% of the $51.7 million in total benefits.

EPA's estimate of increased angler participation ($1 .5 million annually under the high-end scenario) is based on the unsupported assumption that reducing pollution causes more people to fish. It is just as likely that it does not.

Response to: CTR-040-046

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA Chapter 8). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to CTR-035-009a.)

U.S. EPA, 1993. Regulatory Impact Analysis of the Proposed Great Lakes Water Quality Guidance. Final Report, April 15.

EPA estimated the percentage of California waters impaired by toxic pollutants based on water quality assessments developed by the State Water Resources Control Boards. EPA defined toxic-impaired waters as those rated medium or poor for one or more toxic pollutants or group of pollutants. Research (e.g., Lyke, 1993) indicates that the recreational value of water resources may be substantially enhanced by reducing toxic contamination.

Comment: C. Benefits Analysis pp. 5-7 - 5-8 (U.S. EPA, 1997a) -- Attribution of Benefits to the Control of Point Sources

We applaud EPA's effort to analyze and report the proportion of the total benefits that might accrue due to the implementation of controls on point source NPDES dischargers in the benefits analysis (although we believe that this apportionment should have been carried through to the estimates of passive use benefits). We believe that it is appropriate to state the benefits that can be attributed to the estimated expenditures. We recognize, however, that there are many limitations in this approach, and that better data are needed. For instance, the pollutant loadings data used in this analysis were old and outdated (specifically, the Davis and NOAA studies contained data that are 10-15 years old). We urge EPA to update these studies with more recent data for the final Economic Analysis.

We believe that the benefits analysis illustrates that, in many instances, point source controls will not produce significant benefits. For instance, this is illustrated by the fact that the projected health benefits of the CTR in reducing both cancer and baseline systemic risks are minimal (see pp, 8-11 - 8-16, (U.S. EPA, 1997a)). Another example is illustrated by an examination of those water bodies for which fish consumption advisories have been issued. For those included on the State's 303(d) list, except for San Francisco Bay, the causes of impairment are largely listed by the SWRCB as nonpoint sources, including mining or resource extraction, agricultural drainage or runoff, urban stormwater runoff, or other unspecified nonpoint sources (SWRCB, 1996).

In addition, the analysis of benefits should highlight more clearly the fact that there may be little or no benefits in the near-term due to long-term environmental persistence of existing contamination. As EPA itself acknowledges on p. 5-8 (U.S. EPA, 1997a), "historical loads may, in some instances, be the predominant source of toxics-related water quality problems. In such instances, efforts to control current discharges may be of relatively limited effectiveness and value." It is well-documented that some substances, such as DDT and PCBs, which have been banned for two or more decades, still persist in the environment; thus, the likelihood of the CTR substantially reducing loadings and producing benefits is minimal.

Response to: CTR-035-051c

As described in the EA (Chapter 8), research provides empirical evidence of the passive use values associated with improved water quality and fisheries. Research also indicates that these values are at least half as great as recreational values, such that if they are potentially applicable to a policy action,

providing a rough approximation is preferable, with proper caveats, to omitting them from the analysis of benefits and costs. EPA believes that the studies used to calculate the ratio of passive use to use value are applicable to the CTR (see also comment and response CTR-026-009).

Therefore, EPA applies a ratio of .5 to obtain an estimate of passive use values for those households that have active recreational anglers. Based on a review of the literature, EPA believes that non-angling household do indeed have a passive use value. To determine a lower-bound estimate of passive use values for non-angling households, EPA assumed that the value may be 30% of the value for angling households. For analysis of the final CTR, EPA revised the upper-bound estimate assuming that the passive use value of non-angling households may be 90% of those for angling households. This revision is based on a study by Loomis et al. (1991), who estimated the benefits of improved fishery, wetland, and waterfowl resources in the San Joaquin Valley to users and nonusers residing in California.

By multiplying a ratio of passive use to use value by recreational fishing values, which EPA apportioned to reflect the relative contribution of point sources, EPA also accounted for attribution in its estimate of passive use values.

For the EA that accompanied the proposal, EPA conducted an extensive search of the literature for more recent data or information related to the relative contributions of various sources to water quality impairments. In the EA accompanying the proposal, EPA solicited additional data, however, none was received. In revising the EA for the final rulemaking, EPA conducted an additional extensive search of the literature and research efforts at California universities for relevant information. EPA has incorporated any new information into the revised EA for the final rule.

Although the standards established by the CTR apply to all sources, EPA's analysis examined only the portion of benefits expected to be achieved by controlling point sources. EPA estimated the point source share of benefits based on data and information on the relative contribution of all sources to toxic loadings in California waters. Although point sources may account for only a small portion of the load in some waters, they may account for relatively larger portions at some sites, and point source controls will contribute to meeting standards in the water bodies.

EPA recognizes the persistence of some of the substances addressed by the CTR (e.g., DDT and PCBs) and the impact of this persistence on the realization of benefits. In the EA (Chapter 9), EPA accounted for this lag by assuming 10- and 20-year phase-in periods for benefits in its comparison of present value benefits and costs.

In addition, EPA believes that point source controls can factor into pollutant reduction scenarios, although the cost-effectiveness of point and nonpoint source controls are likely to be highly site specific. Potential "hidden" loads (contaminant concentrations which are not currently measured because they are below detection levels) from point sources may also be occurring and may increase the potential benefits of point source controls. In addition, point source loadings reductions will reduce future sediment contamination and, thereby, reduce the need for costly site-specific sediment remediation in the future. Therefore, the CTR can be viewed as both reducing current environmental risks (yielding benefits) by reducing current loadings, and reducing future environmental cleanup costs.

Comment: Weaknesses in Benefits Analysis

USEPA's benefits analysis is even weaker than its cost evaluation. For example:

* Although there is evidence that the Rule could result in no benefits in the near-term due to long-term environmental persistence of existing contamination, the Analysis does a poor job of highlighting this potential outcome. For example, there is some likelihood that benefits could truly be zero, while under no circumstances will Rule implementation be costless. Likewise, USEPA's use of ranges to express potential benefit values may mislead readers into believing that the estimated high benefits are as likely to be achieved as the low benefits, when in fact the probability that different benefit levels will actually be achieved varies greatly from low to high.

Response to: CTR-035-065a

The range of estimated benefits in part reflects the range in loadings reductions that may result from point source controls given the flexibility in State implementation procedures. The decision as to which implementation procedures will be employed, and therefore what costs and benefits will result, will be made by state and local entities for specific locations.

Comment: pp. 6-1 - 6-12 (U.S. EPA, 1997a) -- Assessment of Potential Ecological Benefits

EPA should state in the Economic Analysis that there may not be a one-to-one relationship between benefits and reductions in toxic pollutants, due to the fact that factors such as habitat alteration, competition from invasive exotic species, inadequate flows, hydrologic modification, channelization, and other disturbances, may pose serious threats to ecological resources, and may undermine or partially negate the benefits of the rule.

Response to: CTR-035-052

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA acknowledges that applying Lyke's results to all California waters affected by toxics may overstate potential benefits (see EA Chapter 8). Anglers may or may not be aware of toxic contamination in the absence of fish consumption advisories. EPA acknowledges the limitations in the application of Lyke's research. However, EPA chose this approach to provide illustration of the potential magnitude of recreational angling values rather than leave this important benefit category unmonetized.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA first applied Lyke's research in its analysis of the potential benefits of the Great Lakes Water Quality Guidance. Calculation of the range of results is explained in U.S. EPA (1993). Lyke estimated the Wisconsin Great Lakes open water sport fishery to be worth between $339 and $424 per licensed angler, resulting in an estimated consumer surplus associated with the fishery of between $66.6 million

and $83.3 million annually. Lyke obtained values for a contaminant-free fishery ranging from $7.4 million to $26.1 million per year, with the range in results attributable to whether a linear or constant elasticity of scale functional form is used in the estimation. These results reflect between 11.1% and 31.3% of the value of the fishery under current conditions, which is the range of values EPA used in analysis of the CTR.

EPA acknowledges that Lyke-based benefits represent a substantial portion of total benefits and supports these benefits estimates. (See also comment and response to CTR-035-009a.)

U.S. EPA, 1993. Regulatory Impact Analysis of the Proposed Great Lakes Water Quality Guidance. Final Report, April 15.

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

EPA agrees that the contingent valuation method (CVM) elicits an individual's stated willingness to pay or accept compensation. The benefit-cost comparisons in EAs are prepared to inform the public and policy makers. Thus, the strengths and weaknesses of all aspects of the EA, including methodologies for estimating benefits, need to be made clear so that readers are aware of the limits and uncertainties. However, a 1993 Blue Ribbon Panel convened by the National Oceanic and Atmospheric Administration (NOAA) evaluated CVM and found it to be an appropriate methodology for measuring values. It is also the only method accepted by the U.S. Department of the Interior (DOI) to estimate nonuse values and has withstood Federal Court review for its use in litigation contexts.

Additionally, much of the criticism of CVM is conceptual rather than based on empirical research. Where CVM can be compared to other research techniques (e.g., use values estimated by the travel cost methodology or the hedonic price method), CVM is shown to yield similar values (see Brookshire et al., 1982 and Smith et al., 1986). Additionally, in several field experiments, actual purchase decisions were compared to hypothetical purchase decisions (Bishop and Heberlein, 1978 and Dickie et al., 1987). In all of these studies, hypothetical behavior was sufficiently predictive of actual behavior that researchers

concluded meaningful values could be obtained for benefit-cost analysis or damage assessment.

Comment: * The benefits analysis does a poor job of evaluating the marginal impacts of the proposed rule. For example, "...even low contaminant concentrations in water, sediment, or diet may impair fitness, produce adverse-physiological effects that lead to death, or lower long-term survivability in the wild." Likewise, related to environmental benefits:

-- Only a qualitative description of ecologic benefits is provided because of.. (4) uncertainty regarding the extent to which the CTR will result in toxics loading reductions significant enough (relative to the contribution of historical and ongoing point and nonpoint loadings) to generate changes in ambient concentration and ecosystem health (U.S.EPA, 1997a, page 6-10).

Benefits are unlikely to be linear, but rather related to threshold changes in the environment.

Response to: CTR-035-067

EPA provided a qualitative description of benefits to supplement its quantitative analysis, acknowledging that even low concentrations of toxics in water, sediment, or diet may impair fitness or produce adverse physiological effects that can lead to death or lower long-term survivability in the wild (see EA Chapter 6).

Comment: The benefits accruing from these costs would be minimal. The addition of lime treatment at three BADA agency plants to remove copper would have the effect of reducing copper loads to the Bay by 2,400 lbs/year (see Attachment 2). To put this in perspective, this is about 1 % of the total copper load to the Bay based on the Regional Board's 1993 Copper Wasteload Allocation. The cost per toxic pound equivalent removed would be between $2,300/lb and $14,800/lb, the former based on EPA's assumption regarding the cost and effectiveness of primary lime addition and the latter based on the assumption that tertiary lime treatment would be necessary. Further, the RMP has generally shown that the dissolved copper criteria is generally achieved in the Bay, with the exception of occasional exceedances in the extreme South Bay and the Petaluma River. Of 216 measurements made over 9 RMP sampling events, only about 10% of the samples exceeded the proposed criteria, with the highest single value recorded being 5.93 ug/l. Loading data is unavailable for the organics, but the RMP data show that there were no exceedances at any station for heptachlor and one of the problematic PAHs and that the other two problematic PAHs were exceeded in less than 3% of the samples. Like copper, the PAH exceedances occurred in the South Bay and the Petaluma River. Hence, reduction of PAHs in the one deep water discharger with attainability problems would not change the current level of compliance. The RMP did not analyze for aldrin. EPA's economic analysis based benefits estimates on improved fishing experience and increased angler participation, reduced cancer risks, and nonuse values associated with compliance with all water quality standards. A 1% reduction in copper loading to the Bay would not trigger any of these benefits, nor would controls that do not result in any change in the present level of compliance in Bay waters of PAHs and heptachlor criteria. Irrespective of the fact that the RMP-measured level of compliance with the subject PAHs is 97% and with heptachlor is 100%, EPA's cancer risk analysis identifies heptachlor as contributing 0.1% to the baseline cancer risks for anglers consuming Bay fish and does not list any PAH (see Economic Analysis Exhibit 8-7). In conclusion, adoption of the proposed criteria, while potentially imposing considerable costs on BADA agencies, would have very little beneficial impact on the Bay. Copper loading would be reduced by 1% and PAH compliance would remain unchanged at 97% to 100%.

Response to: CTR-054-006

As part of its revised cost analysis, EPA estimated the changes in estimated costs and pollutant load reductions based on the lower risk level of 10-5. Under the low scenario, costs decrease by $1.1 million, approximately 11% less than the costs based on the higher risk level. Under the high scenario, annual costs decrease by $5.8 million, also an 11% decrease from the costs based on a 10-6 risk level. Pollutant load reductions attributable to use of a lower risk level are estimated to decrease by approximately 4% and 1% under the low and high scenarios, respectively. The relatively low sensitivity of costs to the change in risk level primarily is related to the fact that most of the potential costs related to implementing the CTR are being driven by metals. Changes in risk levels for carcinogens primarily affect organic pollutants.

EPA believes that controls on point source dischargers will, in many cases, contribute to attaining standards in a given water body. As controls on other sources are also implemented, the water quality standards can be achieved. However, the total maximum daily load (TMDL) process is provided to address cost-ineffectiveness as it pertains to point or nonpoint sources. For example, if controls on nonpoint sources are a more cost-effective approach to achieving standards, the State can redistribute the load allocations through the TMDL process.

EPA recognizes that the benefits of the rule will not occur immediately, and has estimated lags in the

realization of benefits. However, EPA believes that the standards established by the CTR can be achieved through point source controls and will result in attaining designated uses of the water bodies, and that the estimated benefits are illustrative of the types and potential benefits to be achieved from attaining these uses.

The U.S. EPA Treatability Database indicates that chemical precipitation with addition of lime is a technology capable of removing metals at the concentrations and loading reductions required. For example, several treatment plants have reached concentrations of 7.7 ug/L for copper based on a pilot study (CTR-based level for copper is 8.03 ug/L) and 0.46 ug/L for silver (CTR-based level for silver is 1.51 ug/L) (U.S.EPA RREL). Some of the sample facilities already have a clarification system in place, therefore, only capital costs for the lime feeding and conveying system need to be considered. For facilities without clarifiers, the capital cost of a primary clarifier is also included in EPA's cost estimates. EPA's cost estimates are based on EPA's Treatability Manual (1980) and are adjusted for inflation.

Comment: The economic analysis is seriously flawed. The major flaws include: (1) failing to do an appropriate sampling of dischargers; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule (see Attachment 3). The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. BADA's analysis shows that its member agencies alone could be faced with costs in excess of $100 million per year to achieve effluent limits based on the copper, PAH, heptachlor and aldrin criteria. BADA's analysis also indicates that the benefits associated with this expenditure will be difficult to measure. Copper loadings will be reduced by 1% and the level of compliance for PAH's and heptachlor will remain unchanged at its present high level. Certainly these benefits will not measurably improve the fishing experience or measure the number of fisherman in the Bay, significantly reduce the cancer cases, or improve property values or other nonuse benefits, as estimated in EPA's economic analysis. A further consequence of the flawed economic analysis is the conclusion that the CTR is not a major rule (i.e., one which will result in excess of $100 million per year expenditure) subject to Presidential Executive order 12866 and the Unfunded Mandates Reform Act or a

rule that affects small entities protected under the Regulatory Reform Act. BADA agencies provide service to a number of small communities with populations under 50,000 people that could be greatly impacted by the proposed rule.

Response to: CTR-054-013d

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of controlling other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

EPA considers Lyke's scenario (waters completely free of contaminants that may threaten human health) to be similar to a scenario in which all California waters meet the water quality standards established by the CTR. EPA has no information to show that these standards cannot be achieved. Thus, EPA used Lyke's results to estimate the total potential benefits of achieving standards. However, since point source controls alone may not be sufficient to achieve the standards throughout California, EPA allocated only a portion of the total benefits to the CTR.

EPA agrees that the study site for Lyke's research is substantially different from California waters. However, EPA's search of the literature indicated that there is no similar research for California or other more similar waters. Therefore, EPA applied Lyke's results to provide decisionmakers with information on the types and potential magnitude of the benefits from water quality improvements, rather than leaving this important benefit category unmonetized. EPA has no information to determine whether California residents may value toxic-free waters more or less than Wisconsin residents.

In addition, EPA believes that Lyke's scenario does not capture another component of potential value to current anglers that may result as reduced levels of toxic pollutants result in healthier sport fish populations. Lyke's survey asked anglers to consider a fishery that is free of contaminants that may threaten human health. However, fish are more sensitive than humans to some classes of toxic pollutants and fish populations may increase as contamination is reduced. To the extent that reducing toxic contamination results in a more satisfying angling experience in terms of increasing catch rates, achieving water quality standards may result in an increase in value to current anglers beyond that associated with reducing human health concerns.

Comment: Comment #7: General Benefit Analysis Concerns

The benefit analysis undertaken by EPA uses old, out-of-state data which does not appear applicable to

California. A major concern with this analysis is that the benefit recipients are only a subset of those impacted by the costs. Another is that the benefits accrue to the public at large; costs, on the other hand, to the extent that CTR-implementation costs are borne by Indirect Dischargers (as assumed by EPA in the copper situation) accrue to businesses.

Further, the benefit measurements of "angling day" are only useful if they represent a net increase in fishing activity -- if all that improving waterway quality does is create additional sites where safe fishing can occur, without increasing the overall amount of fishing that occurs, there is no net gain, there is only substitution between comparable sites. The value of benefits which occur because of substitution between fishing sites must be subtracted from the value which occurs from increased fishing. This has not been done in the EPA analysis, thus benefits are overstated.

Further, no stratification is evident to account for importation of out-of-state fishers -- including benefit value of attracting new anglers from other states to California fishing sites is irrelevant to an analysis of costs/benefits of implementing the CTR for California.

Questions for EPA on Comment #7:

Q.7 - 1) If the concerns stated above were appropriately addressed, what would be the impact on EPA's benefits analysis? Our concern relates to the need to examine levels of regulation in comparison to benefits obtained, i.e. cost-effectiveness.

Q.7 - 2) Executive Order 12866, in recognition that quantification of benefits is very difficult, is quite explicit about addressing qualitative benefits wherever possible why wasn't that done in this analysis?

Response to: CTR-092-023b

EPA was not able to locate more relevant or more recent data or research for the analysis. EPA solicited relevant data and information in the EA and proposal. In addition, in response to comments, EPA conducted an extensive search of the literature for any additional recent, California-specific data or information applicable to the benefits analysis. EPA reviewed and evaluated all data and information submissions, and the results of the literature search, and revised the EA and CTR as appropriate prior to promulgating the final rule.

Although it is true that the direct costs of the regulation are borne by municipal and industrial dischargers while the benefits accrue to the public at large, it is also true that in generating the discharges, the benefits (cost savings) accrued to businesses and municipalities while the costs (decreased utility associated with water resources) were borne by the public. Ultimately, benefits and costs are borne throughout society (e.g., costs are borne directly by municipal and industrial dischargers but indirectly by the public who pays for their products and services).

EPA acknowledged that increased angling activity at sites experiencing reductions in toxic contaminants may reflect a shift in activity from substitute sites rather than a net increase. Because EPA could not account for substitute sites in this analysis, EPA estimated lower bound benefits of $0 (i.e., assuming no net increases in activity; see EA, Chapter 8).

EPA's estimate of the relevant angling population is based on resident California anglers (see Analysis of the Potential Benefits Related to Implementation of the California Toxics Rule, Draft, December 20, 1996, pp. 3-23, 3-35 to 3-36).

EPA revised its economic analysis in response to comments and to reflect any new data or changes to the proposal. The estimated cost-effectiveness of the rule is expected to range from $22/lb-eq to $31/lb-eq. EPA expects the total annual, monetized benefits from implementation of the CTR to range from $8.7 to $40.8 million dollars.

Chapter 6 of the EA (Qualitative Assessment of Potential Ecological Benefits) provides a qualitative discussion of potential ecological benefits. EPA also provided a qualitative discussion of important benefit categories that it was not able to quantify or monetize (see the EA that accompanied the proposed rule, Chapter 8).

Comment: * Most of the public health benefits appear to be associated with a small number of contaminants, acting to mask the benefit cost analysis. For example, cancer risks are dominated by four contaminants, two of which -- DDT and PCBs -- may be substantially unrelated to ongoing point sources. In other words, while costs are associated with reductions in a wide range of toxic materials, benefits may be derived from a small subset of these toxins, most of which are primarily related to non-point sources or historical contamination.

Response to: CTR-035-069

EPA analyzed potential reductions for over forty toxic pollutants that may be discharged by point sources. EPA expects that reductions in these toxics will lead to a variety of benefits including ecological, health, and recreational benefits. Although certain health risks such as cancer are indeed dominated by only a few toxic contaminants that may not be greatly reduced by point source controls, reductions of these toxics are, nevertheless, expected to yield reductions in cancer cases as well as systemic health risks. EPA expects the annual reduction in cancer cases among recreational anglers after implementation of the CTR to range from 0.0 to 0.1 for San Francisco Bay and 0.0 to 0.8 for freshwater resources. EPA also analyzed the post-CTR hazard quotients (HQ) for systemic risks among recreational anglers with high consumption rates. The HQ for PCBs may be reduced from 11.31 to 5.44 for San Francisco Bay anglers and from 7.02 to 3.28 for freshwater anglers.

Comment: Economic Analysis

The Sanitation Districts commends EPA for preparing an analysis of the economic impacts of the proposed CTR, and for selecting POTWs for half of the case studies. We believe that EPA is correct in thinking that POTWs are likely to experience major impacts as a result of the promulgation of the CTR. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Our own attainability and cost analysis indicates that there are indeed fundamental flaws in the cost analysis. A few of the areas of concern are listed below:

* The Economic Analysis suggests that reductions attributable to point source reductions may be de minimis. For instance, most of the public health benefits appear to be associated with a small number of contaminants, most of which are not discharged in significant quantities by point source dischargers. Cancer risks, for example, are dominated by four contaminants, two of which -- DDT and PCBs -- are mainly the result of historic discharges rather than due to ongoing point source inputs.

Response to: CTR-059-025

EPA analyzed potential reductions for over forty toxic pollutants that may be discharged by point sources. EPA expects that reductions in these toxics will lead to a variety of benefits including ecological, health, and recreational benefits. Although certain health risks such as cancer are indeed dominated by only a few toxic contaminants that may not be greatly reduced by point source controls, reductions of these toxics are, nevertheless, expected to yield reductions in cancer cases as well as systemic health risks. EPA expects the annual reduction in cancer cases among recreational anglers after implementation of the CTR to range from 0.0 to 0.1 for San Francisco Bay and 0.0 to 0.8 for freshwater resources. EPA also analyzed the post-CTR hazard quotients (HQ) for systemic risks among recreational anglers with high consumption rates. The HQ for PCBs may be reduced from 11.31 to 5.44 for San Francisco Bay anglers and from 7.02 to 3.28 for freshwater anglers.

Comment: The City does not agree with the economic analysis. It is incomplete and misrepresents the actual costs and benefits. The analysis does not include costs of expensive AWT to meet more stringent limits based upon the proposed criteria. It does not include the first second, and third order costs to the community, individuals and businesses, of the economic dislocations resulting from huge capital costs, especially for small and economically distressed communities, that divert scarce resources from other priorities or out of the area. It does not include cost impact assessments to low and fixed-income households - ignoring the economic aspects of environmental justice. The benefits assessments make vast unsupported assumptions about the benefits of reductions in constituent concentrations that are barely, if even, measurable, and assigns unrealistic contingent valuations to these assumed benefits. The cost analyses does not follow EPA's own economic assessment guidance (which, itself, is fatally flawed). These points were brought up during the Task Force meetings in 1995 and 1996, but were dismissed outright by EPA. The City hereby raises these issues for the formal record.

The City of Thousand Oaks appreciates the opportunity to comment on the proposed California Toxics Rule.

Sincerely,

Donald H. Nelson Public Works Director

Response to: CTR-009-008c

EPA's own economic assessment guidance (Interim Economic Guidance for Water Quality Standards, EPA-823-B-95-002, March 1995) is intended to assist States and applicants in understanding the economic factors that may be considered, and the types of tests that can be used to determine if a designated use cannot be attained, if a variance can be granted, or if degradation of high-quality water is warranted. In order to remove a designated use or obtain a variance, or if degradation of high-quality water is warranted, the state or discharger must demonstrate that attaining the designated use would result in substantial and widespread economic and social impacts. Although EPA is responsible for approving a State's water quality standards, the State is responsible for interpreting the circumstances of each case and determining where there are substantial and widespread economic and social impacts, or where important social and economic development would be precluded.

Estimating the economic impact of the CTR in California requires a detailed econometric model of the region's economy. EPA did not conduct such an analysis of the rule. However, for a similar toxics rule in

the Great Lakes Basin, an econometric analysis was performed independent of the regulatory impact analysis for the Council of Great Lakes Governors (The Great Lakes Water Quality Initiative: Cost Effective Measures to Enhance Environmental Quality and Regional Competitiveness. DRI/McGraw-Hill, San Francisco, California, July 1993). This analysis showed a minimal impact of the rule on the region's economy for a worst case scenario, a scenario with costs far exceeding those estimated by EPA. Manufacturing output was estimated to fall by between 0.008% and 0.337% over a range of four scenarios evaluated, while personal income loss was estimated at between 0.002% and 0.094% for these scenarios. As a result, the study authors concluded that the impact of the rule on the region's economy would be "nearly imperceptible." Thus, similar controls on toxic pollutants have been shown to be affordable in other regions of the country. In addition, all of the United States, with exception of California, has implemented CWA section (c)(2)(3).

Comment: EPA's estimate of increased value of recreational angling ($8.6 million annually under the high-end scenario) is highly suspect:

* It is based on a Ph.D. dissertation that does not appear to have been subjected to outside peer review (no paper has been found in a peer-reviewed journal). The primary focus of the dissertation was the evaluation, using Wisconsin anglers, of a travel cost model to value changes in environmental quality. A secondary purpose as to evaluate a contingent valuation model todetermine the increased value of fishing in pollutant-free waters. The dissertation was based on two surveys of Wisconsin anglers, one set of anglers who fished for trout and salmon in the Great Lakes and another set who fished for the same fish in inland waters. The surveys contained 64 questions, only two of which addressed the increased value of recreational angling in pollutant-free water, There were 274 respondents to the Great Lakes survey and 239 respondents to the inland waters survey. (see Attachment B-2)

* EPA seems to have selectively used the dissertation. For example, EPA used the results of the Great Lakes survey (which showed an 11.1% increase in value based on mean values) but did not use the inland waters survey (which actually showed a reduction in value with pollutant-free water). This of course raises questions about the validity of the survey and the values present in the dissertation. Further, in estimating the high-end benefits, EPA appears to have used the pollutant-free mean value and compared that to the low-end polluted water value (mean value minus the standard error). It is not clear why EPA would have done this.

* This approach assumes that the current value of recreational angling in California is impaired as a result of pollution. That may be the case in some waters of the State, but it is certainly not the case in the vast majority of the State's waters.

* This approach also assumes that the CTR will result in pollutant-free water, which, as stated previously, is not the case.

Response to: CTR-040-045

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA estimated the percentage of California waters impaired by toxic pollutants based on water quality assessments developed by the State Water Resources Control Boards. EPA defined toxic-impaired waters as those rated medium or poor for one or more toxic pollutants or group of pollutants. Research (e.g., Lyke, 1993) indicates that the recreational value of water resources may be substantially enhanced by reducing toxic contamination.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of the States's actions that may control other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

This of course raises questions about the validity of the survey and the values present in the dissertation. Further, in estimating the high-end benefits, EPA appears to have used the pollutant-free mean value and compared that to the low-end polluted water value (mean value minus the standard error). It is not clear why EPA would have done this.

* This approach assumes that the current value of recreational angling in California is impaired as a result of pollution. That may be the case in some waters of the State, but it is certainly not the case in the vast majority of the State's waters.

* This approach also assumes that the CTR will result in pollutant-free water, which, as stated previously, is not the case.

Response to: CTR-041-041

EPA acknowledges that Lyke's study has not been published in a peer reviewed journal and that she obtained some inconsistent results. EPA applied Lyke's research to illustrate the types and potential magnitude of the benefits from water quality improvements. EPA conducted an extensive search of the literature for additional studies that provide indication of the potential magnitude of the benefits from reducing concentrations of toxic pollutants in California surface waters. The results of EPA's search are described in the EA that accompanies the final rule.

EPA estimated the percentage of California waters impaired by toxic pollutants based on water quality assessments developed by the State Water Resources Control Boards. EPA defined toxic-impaired waters as those rated medium or poor for one or more toxic pollutants or group of pollutants. Research (e.g., Lyke, 1993) indicates that the recreational value of water resources may be substantially enhanced by reducing toxic contamination.

EPA's analysis presents only the portion of the total potential benefits that can be achieved by controlling point sources. EPA expects additional benefits will accrue as a result of the State's action that may control other sources. EPA has no reason to believe that the standards established by the CTR cannot be achieved.

Comment: EPA's estimate of increased value of recreational angling ($8.6 million annually under the high-end scenario) is highly suspect:

* It is based on a Ph.D. dissertation that does not appear to have been subjected to outside peer review (no paper has been found in a peer-reviewed journal). The primary focus of the dissertation was the evaluation, using Wisconsin anglers, of a travel cost model to value changes in environmental quality. A secondary purpose as to evaluate a contingent valuation model to determine the increased value of fishing in pollutant-free waters. The dissertation was based on two surveys of Wisconsin anglers, one set of anglers who fished for trout and salmon in the Great Lakes and another set who fished for the same fish in inland waters. The surveys contained 64 questions, only two of which addressed the increased value of recreational angling in pollutant-free water, There were 274 respondents to the Great Lakes survey and 239 respondents to the inland waters survey. (see Attachment 3-2)

* EPA seems to have selectively used the dissertation. For example, EPA used the results of the Great Lakes survey (which showed an 11.1 % increase in value based on mean values) but did not use the inland waters survey (which actually showed a reduction in value with pollutant-free water). This of course raises questions about the validity of the survey and the values present in the dissertation. Further, in estimating the high-end benefits, EPA appears to have used the pollutant-free mean value and compared that to the low-end polluted water value (mean value minus the standard error). It is not clear why EPA would have done this.

Comment: Major Concerns About the Proposed Criteria and Rule

1. The Proposal is Based on Poor Data and Will Not Result in Better Water Quality for California. We stated that our own attainability analysis and that of BADA show that San Francisco,) will be impacted by this rule. Unfortunately, due to the short time for review, the poor quality of data and basis for statements and assumptions in the proposal and the problem with detection limits we cannot specifically say what will be the cost to Sari Francisco. One analysis tell us it could be $2.3 million per year annualized costs and another analysis tells us it could be much more. We strongly recommend major revision to the proposal and the economic analysis before final promulgation for the following reasons:

The benefits section of the economic analysis is extremely flawed; the data used to develop the benefits section is highly questionable, some of which has not been peer reviewed (see BADA comments);

Response to: CTR-090-004

Comment: Comment #7: General Benefit Analysis Concerns

The benefit analysis undertaken by EPA uses old, out-of-state data which does not appear applicable to California. A major concern with this analysis is that the benefit recipients are only a subset of those impacted by the costs. Another is that the benefits accrue to the public at large; costs, on the other hand, to the extent that CTR-implementation costs are borne by Indirect Dischargers (as assumed by EPA in the copper situation) accrue to businesses.

Further, the benefit measurements of "angling day" are only useful if they represent a net increase in fishing activity -- if all that improving waterway quality does is create additional sites where safe fishing can occur, without increasing the overall amount of fishing that occurs, there is no net gain, there is only substitution between comparable sites. The value of benefits which occur because of substitution between fishing sites must be subtracted from the value which occurs from increased fishing. This has not been done in the EPA analysis, thus benefits are overstated.

Further, no stratification is evident to account for importation of out-of-state fishers -- including benefit value of attracting new anglers from other states to California fishing sites is irrelevant to an analysis of costs/benefits of implementing the CTR for California.

Questions for EPA on Comment #7:

Q.7 - 1) If the concerns stated above were appropriately addressed, what would be the impact on EPA's benefits analysis? Our concern relates to the need to examine levels of regulation in comparison to benefits obtained, i.e. cost-effectiveness.

Q.7 - 2) Executive Order 12866, in recognition that quantification of benefits is very difficult, is quite explicit about addressing qualitative benefits wherever possible why wasn't that done in this analysis?

Response to: CTR-092-023c

EPA was not able to locate more relevant or more recent data or research for the analysis. EPA solicited relevant data and information in the EA and proposal. In addition, in response to comments, EPA conducted an extensive search of the literature for any additional recent, California-specific data or information applicable to the benefits analysis. EPA reviewed and evaluated all data and information submissions, and the results of the literature search, and revised the EA and CTR as appropriate prior to

promulgating the final rule.

Although it is true that the direct costs of the regulation are borne by municipal and industrial dischargers while the benefits accrue to the public at large, it is also true that in generating the discharges, the benefits (cost savings) accrued to businesses and municipalities while the costs (decreased utility associated with water resources) were borne by the public. Ultimately, benefits and costs are borne throughout society (e.g., costs are borne directly by municipal and industrial dischargers but indirectly by the public who pays for their products and services).

EPA acknowledged that increased angling activity at sites experiencing reductions in toxic contaminants may reflect a shift in activity from substitute sites rather than a net increase. Because EPA could not account for substitute sites in this analysis, EPA estimated lower bound benefits of $0 (i.e., assuming no net increases in activity; see EA, Chapter 8).

EPA's estimate of the relevant angling population is based on resident California anglers (see Analysis of the Potential Benefits Related to Implementation of the California Toxics Rule, Draft, December 20, 1996, pp. 3-23, 3-35 to 3-36).

EPA revised its economic analysis in response to comments and to reflect any new data or changes to the proposal.

(EPA revised.....already part of text)....The estimated cost-effectiveness of the rule is expected to range from $22/lb-eq to $31/lb-eq. EPA expects the total annual, monetized benefits from implementation of the CTR to range from $8.7 to $40.8 million dollars.

Chapter 6 of the EA (Qualitative Assessment of Potential Ecological Benefits) provides a qualitative discussion of potential ecological benefits. EPA also provided a qualitative discussion of important benefit categories that it was not able to quantify or monetize (see the EA that accompanied the proposed rule, Chapter 8).

Comment: THE PROPOSAL VIOLATES THE NATIONAL ENVIRONMENTAL POLICY ACT AND ENDANGERED SPECIES ACT, AND WOULD USURP THE ROLE OF CONGRESS AND THE STATE AND REGIONAL BOARDS

Major environmental impacts of controls could also be foreseen if the water quality standards of the proposed CTR were to apply as numeric effluent limitations or wasteload allocations. This would result in the requirement to prepare an EIS in connection with the proposed rule. (*13) In effect, substantial end-of-pipe treatment facilities on the same order of magnitude as existing POTWs in the Bay Area could be necessary.

Given the scale and location of the facilities that would be required, significant wetland, endangered species and other environmental impacts could occur. EPA must fully evaluate these impacts of the proposed rule before the rule is promulgated. (*14)

A more expansive application of the WQS also would usurp the basin planning process to the extent that the regional boards have included textual discussions of how ambient water quality criteria are to be implemented, particularly with respect to MS4s. The San Francisco Basin Plan states generally that WQS are to be addressed by MS4s through escalating BMPS. EPA has not taken action to disapprove the San Francisco Basin Plan and cannot implicitly repeal portions of that plan through inconsistent preamble language in the currently proposed rule.

Congress has already addressed this significant public policy question and the agency cannot shed its Congressional leash and arrogate legislative power. This is particularly true given the massive expenditures of public funds that could be implicated under at least the more expansive view of what EPA has proposed. We elect our representatives in Congress to balance these major questions, such as the matter of whether local funds should be siphoned from schools, police, infrastructure, etc., to fund storm water controls at the scale necessary to meet WQS regardless of cost. Congress has determined in Section 402(p) that MS4s need only adopt controls to reduce pollutants in storm water to the maximum extent practicable, and to effectively prohibit non-storm water discharges to the storm water system, rather than being subjected to infeasible or exorbitantly expensive numeric effluent limitations.(*15)

(*13) To the extent that the CTR will force development of end of-pipe treatment systems, promulgation of the CTR will represent a major federal action significantly affecting the quality of the human environment under the National Environmental Policy Act, triggering the requirement to develop an

environmental impact statement to support the rule.

(*14) Commenters have been limited in their ability to present specific information on the question of endangered species, wetland and other environmental impacts given the short comment period on the proposal and EPA's refusal to extend that comment period.

(*15) In Sections 402(p)(5) and (6)f Congress also directed that the approach to meeting water quality standards should MEP-level controls on major dischargers fall short would be to study and expand the scope of the program to include additional dischargers. No mention is made of subjecting major MS4s to more stringent controls. In fact, the regulations are expressly required to target stormwater discharges, other than those discharges described in paragraph (2) [major MS4S], to be regulated to protect water quality - 33 U.S.C. section 1342(p)(6) (Emphasis added).

Response to: CTR-001-009a

With respect to compliance with NEPA, section 511(c) of the Clean Water Act excludes this rulemaking from the requirements of NEPA. The comment also assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in the response to Storm Water Economics Comments (Category J, Comment CTR-040-004), EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

The purpose of the CTR is to fill the current gaps in water quality criteria in inland surface waters and enclosed bays and estuaries. Any existing provisions in a State Basin Plan that have been approved by the State and EPA would not be negated by the preamble discussion in the CTR.

Regarding the application of MEP under section 402(p) of the CWA see response to CTR-040-004.

See also response to CTR-001-009b (Category J-06; Stormwater Economics).

Comment: This is in response to the Environmental Protection Agency's (EPA) August 5, 1997, publication of the Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California; Proposed Rule (Proposed Rule) (Federal Register Vol. 62, No. 150, pages 42159-42208). The Fish and Wildlife Service (Service) provides the following comments specific to EPA's statutory obligations pursuant to section 7 of the Endangered Species Act of 1973, as amended (Act).

Section L of the Proposed Rule states that consultation pursuant to section 7 of the Act will occur. Section 7 of the Act directs that Federal agencies prepare a biological assessment for a proposed action that may affect a listed species, however, to date the Service has not received a biological assessment on the Proposed Rule. The Service has specific concerns regarding selenium, mercury, dissolved metals and PCP and their effects on listed species. Preliminary review indicates that adverse impacts to listed species may occur, therefore, we anticipate that the EPA will formally consult with the Service regarding this proposed rule making process, and will wait until formal section 7 consultation has been completed before finalizing the proposed rule.

The Service looks forward to the opportunity to work with you and our staff on this consultation and appreciates the efforts to date to evaluate the effects of the proposed action on listed species. If you have any questions regarding this response please contact Ms. Maria Boroja at (916) 979-2749.

Response to: CTR-012-001

The US Fish and Wildlife Service (FWS) and US National Marine Fisheries Service initiated formal consultation in a letter to EPA dated November 28, 1997, after reviewing the biological evaluation that EPA submitted to them on October 27, 1997. These documents and others pertaining to the formal consultation process are part of the administrative record of the CTR. EPA completed this process [in October 1999].

Comment: 2. Since the preamble implies that CTR criteria may be applied in NPDES permits for municipal storm water dischargers as numeric effluent limitations, the proposed rule is flawed with regard to: a) setting attainable, scientifically valid criteria in a manner consistent with state and federal regulatory approaches; b) assessing the potential economic impact on the public served by municipal storm water dischargers; c) assessing environmental impacts pursuant to the National Environmental Policy Act and the Endangered Species Act; and d) providing for the coordinated review and evaluation of the proposed CTR in conjunction with the proposed State Implementation Plan.

Response to: CTR-031-002a

Comment: C. If the CTR as proposed in the current draft is applied to municipal storm water dischargers as numeric effluent limitations, new end-of -pipe facilities will result. The impact of these facilities on the environment in general, and endangered species in particular, must therefore be specifically reviewed pursuant to the National Environmental Policy Act and Endangered Species Act.

End-of-pipe facilities would be required for municipal storm water dischargers in their attempt to meet the subject criteria. Storm water facilities must be located in the lowest topographic areas, which contain many of our most valuable and already diminished wetland habitats. This readily foreseeable environmental consequence of the CTR, if directly applied to municipal storm water dischargers, should not be ignored.

Response to: CTR-031-007a

With respect to ESA, EPA has completed consultation as required by Section 7 of the ESA. With respect to compliance with NEPA, section 511(c) of the Clean Water Act excludes this rulemaking from the requirements of NEPA. The comment also assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in the response to Storm Water Economics Comments (Category J, CTR-040-004), EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

Comment: LEGAL ISSUES -- Executive Order 12866, Unfunded Mandates Reform Act, Regulatory Flexibility Act

* SCAP requests that EPA publish in the Federal Register for public review and comment a full discussion of the CTR criteria and implementation provisions that could be affected through the Endangered Species Act Section 7 consultation process with the U.S. Fish and Wildlife service and National Marine Fisheries Service. Additionally, prior to finalizing the CTR, EPA should provide an opportunity for the public to comment on the Biological Evaluation, Biological Opinion, including Reasonable and Prudent Alternatives, and EPA's proposed decisions regarding the Biological Opinion.

Response to: CTR-034-006

The administrative record for the CTR contains documents concerning the ESA consultation. The record contains EPA's biological evaluation and the FWS's and NMFS's biological opinion. The Services' biological opinion is not subject to public comment, rather EPA's proposed rule is subject to comment. Persons wishing to comment on how the rule would affect threatened and endangered species had adequate opportunity to do so during the comment period.

Comment: Lastly, it's been fairly well documented by EPA testimony before the Congress and by other state stakeholders' concerns about the end-of-pipe mandate, because the end-of-pipe facilities that must be constructed in effect create substantial damage to the riparian and other waters of the U.S. that are of primary concern to us.

With that potential, then certainly NEPA and the Endangered Species Act would require an evaluation of the impact associated with a rule causing or leading to those impacts. And again, the current rule does not consider that nor any of the cost or other impacts related to stormwater programs.

So there is a huge consistency or inconsistency problem that we think must be corrected for the rule to be consistent with the statutes and with your executive orders.

Thank you.

Response to: CTRH-001-009b

With respect to ESA, EPA has completed consultation as required by Section 7 of the ESA. With respect to compliance with NEPA, section 511(c) of the Clean Water Act excludes this rulemaking from the requirements of NEPA. The comment also assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in the response to Storm Water Economics Comments (Category J, CTR-040-004), EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

Comment: Regulatory Flexibility and Relief

The District supports EPA's use of "sound science" and current data in developing the proposed criteria in the California Toxics Rule (CTR). The District strongly supports language in the Preamble that references and endorses recommendations of the State Task Forces including use in permitting of:

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Response to: CTR-032-002a

EPA appreciates the commenter's support for the preamble language on State implementation. However, EPA wishes to clarify that for reasonable potential analysis, the CTR preamble did not explicitly recommend any specific method of calculating reasonable potential including those methods chosen by the State Task Force. The State of California as the implementing authority has the discretion to choose any method that meets the requirements of the Clean Water Act. EPA does support the State's consideration of State Task Force recommendations in selecting implementation procedures including reasonable potential methodology.

CROSS REFERENCES C-24

Comment: 1. The rule proposes that the more stringent of site-specific and national criteria be used in determining reasonable potential to exceed water quality standards and in development of limits where site-specific criteria have not yet been established. This proposal ignores the scientific basis of a site-specific criterion and that such a criterion is specifically more relevant and appropriate than a national criterion if derived correctly. EPA has acknowledged that national criteria can be more stringent than necessary to protect designated uses because they are designed to protect a wide variety of surface waters, and that a site-specific criterion can be sufficiently protective while being less stringent than a national criterion (Water Effect Ratio Guidance, 1994). This rule is arbitrarily dismissing the use of site-specific criteria which may be more technically defensible than national criteria, while being protective.

Response to: CTR-037-001b

The proposed rule does not by its own terms dictate whether a particular site-specific criterion or a national criterion should be used in a reasonable potential analysis. The reasonable potential analysis to determine whether a discharger needs a water quality-based effluent limit is based on the criterion that applies to the waterbody. EPA agrees that when an approved state site-specific criterion applies to a particular pollutant for a specific waterbody and EPA determines that it need not adopt a criterion for that pollutant and site in the final rule, the State site-specific criterion should be the criterion upon which the reasonable potential analysis is based.

If EPA promulgates statewide federal criteria before a decision to approve a State-adopted site-specific criteria, the more stringent of the two criteria would be used for water quality programs. Both federal and State water quality programs must be satisfied, and application of the more stringent of the two criteria would satisfy both. The CTR does not preclude future State adoption of site-specific criteria. However, a state-adopted site-specific criterion would become the sole criterion upon which a reasonable potential analysis is based only after EPA approves the criterion and also stays or withdraws the corresponding CTR criterion to the specific site.

Comment: Regulatory Flexibility and Relief

CDA supports language in the CTR Preamble that references and endorses recommendations of the State Task Forces including in part the use of.

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Response to: CTR-086-004a

EPA appreciates the commenter's support for the preamble language on State implementation. However, EPA wishes to clarify that for reasonable potential analysis, the CTR preamble did not explicitly recommend any specific method of calculating reasonable potential including those methods chosen by the State Task Force. The State of California as the implementing authority has the discretion to choose any method that meets the requirements of the Clean Water Act. EPA does support the State's consideration of State Task Force recommendations in selecting implementation procedures including reasonable potential methodology.

Comment: We recommend that EPA:

2. Include in the rule an implementation proposal which states that before a criteria is put into a permit there must first be: an assessment that the pollutant could reasonably interfere with the designated uses of the water; a comprehensive TMDL is done which includes all sources of pollutants to the water body; and a reasonable potential analysis is completed for point source dischargers. Only then, after all of these analyses are completed by the state or EPA should the criteria be converted to a permit limit with the appropriate implementation factors.

Response to: CTR-090-010a

The implementation procedures suggested by the commenter are beyond the scope of this rule. Implementation of water quality standards through various regulatory and non-regulatory tools is primarily a State responsibility.

Generally, a permit limit that implements a criterion for a pollutant will only be considered when it has already been determined that limiting the level of the pollutant is necessary to protect the designated use.

This determination occurs during the standard-setting process. EPA agrees that when multiple sources (point and nonpoint) impact a waterbody, a comprehensive TMDL is the preferred regulatory tool under the CWA for determining how best to achieve any necessary load reduction to the waterbody so as to attain water quality standards. When a TMDL has been conducted, the wasteload allocation (WLA) in the TMDL for a discharger would be basis for developing water quality-based effluent limits. When the TMDL includes a WLA for a discharger, a separate reasonable potential analysis to determine whether or not a WQBEL is needed would in most cases be redundant (although in rare cases, it may be that the level of the pollutant in the discharger's effluent is so much less than the level allowed by a WLA/WQBEL that even under worst case conditions the effluent would not exceed the WQBEL; in these cases, permitting authority would have the discretion not to include a limit.).

As recognized in the preamble to the proposed rule, the TMDL process "can be significantly labor and data intensive." 62 FR at 42185. Delaying WQBELs until TMDLs are completed would be inconsistent with the Clean Water Act and would unnecessarily delay attainment of water quality goals. The CWA requires imposition ofWQBELs whenever technology-based limits are insufficient to attain water quality standards [301(b)(1)(C) and 402], whether or not a TMDL has been completed for that pollutant. Under federal regulations, permitting authorities must analyze whether a discharger would cause or have the reasonable potential to cause or contribute to an exceedance of water quality standards [Section 122.44(d)(1)(i) , and if so, impose a WQBEL that derives from and implements the standard [Section 122.44(d)(1)(vii)]. Permitting authorities need to consider a number of factors related to the characteristics of the effluent and receiving water (including other sources that influence the background levels of pollutants in the receiving water) in making these determinations. [see, e.g., Section 122.44(d)(1)(ii)].

Comment: The proposed implementation plan allowing compliance schedules for effluent limits to attain the criteria to be placed in permits may not pass the antidegradation test either. CBE believes EPA recognizes that permit schedules which allow continued impairment of fishing and aquatic life uses are improper (See e.g., section 1311(b)(1)(C), section 1314(l)(1)(D), section 1342(o)(1) and (3) and section 1313(d)(4)(A) of the Clean Water Act). In the alternative case, however, a schedule allowing discharge of these persistent pollutants to waters attaining the criteria will result in the accumulation of pollutants and will degrade water quality. This degradation is unnecessary as the state has accommodated important economic and social development for years while placing compliance schedules in administrative enforcement orders, and is thus impermissible under 40 CFR section 131.12(a)(2). Indeed, existing California dischargers have been made aware of the need to meet similar or more restrictive criteria since at least 1991, and further extension of time for more pollution should be done through schedules in enforcement orders. Any desire to avoid the administrative effort of continuing to prepare these enforcement orders is easily outweighed by the public interests in clean water and public participation afforded.

In sum, EPA'S. weaker criteria shown in Table 2 do not protect designated uses of water based on sound scientific rationale, and even if this were true for some toxics in some areas of the Bay, the weaker criteria are not necessary to allow important economic or social development. Therefore, revision of water quality standards by adopting these criteria would not meet the tests set forth by 40 CFR section 131.11(a)(1) and section 131.12 and the Clean Water Act provisions these regulations implement, Further, incorporating schedules allowing polluters to harm fishing and aquatic life in water quality standards and effluent limits is improper, and there is no legitimate need for schedules allowing degradation of water quality and restricting public participation to be in permits instead of putting them in administrative enforcement orders as is done today. Thus EPA's proposal may, by failing to provide equal protection for people of color who fish for food and unfairly restricting public participation, also conflict with the Executive Order on environmental justice and civil rights law.

Response to: CTR-002-010b

The Clean Water Act authorizes the use of compliance schedules for meeting water quality standards. Section 303(e), governing the continuing planning process for water quality standards, states that the Administrator shall approve continuing planning processes that have, among other things, effluent limitations and schedules of compliance. See CWA section 303(e)(3)(A) and (F). Congress recognized the practical need for compliance schedules to allow dischargers the time necessary to install treatment to comply with effluent limitations. Other portions of the CWA contemplate that some time is practically necessary in order to allow dischargers time to meet new effluent limits, e.g. section 304(l), providing for

three years to meet water quality based limits in waters that are impaired, and section 301(b)(2), relating to technology-based limits. EPA's implementing regulations also contemplate schedules of compliance. See 40 CFR Section 130.5(1) and (6) which provide that each state must describe the process for developing effluent limitations and schedules of compliance and for establishing and assuring adequate implementation of new or revised water quality standards, including schedules of compliance.

The Environmental Appeals Board has held that an NPDES permit could not contain a compliance schedule unless the State explicitly authorizes such a compliance schedule in state law or regulation. See Star-Kist Caribe, Inc. (NPDES Appeal No. 88-5, May 26, 1992; Earlier Order, April 16, 1990). This holding clearly recognizes that compliance schedules are authorized under the Clean Water Act as part of the state's water quality standards. Further, EPA notes that because parties may challenge particular effluent limitations in particular permit proceedings, they may comment on specific proposed permits and then challenge such permits if they believe that EPA's granting of additional time in a particular context is arbitrary and capricious.

The question at issue in authorizing a compliance schedule is how long is reasonably necessary to meet the water-quality based effluent limit contained in a permit. As is consistent with the Great Lakes Guidance, EPA is authorizing five years as the outside limit for a compliance schedule, but expects permit authorities to use shorter compliance schedules wherever possible, or not to use compliance schedules where they are not necessary. Thus authorizing a compliance schedule does not mean each discharger will be allowed up to that amount of time; rather the permit authority will need to make a judgment about what is technically feasible for the dischargers to come into compliance. Further, recognizing that permit reissuance depends on where in the permit cycle the dischargers is, the rule provides that, in effect, the discharger may have up to ten years from the effective date of the rule to come into compliance with permit limits.

The regulated community commented that the compliance schedule was too short, while some environmental commenters argued that there should be no compliance schedule at all. Here, EPA balanced the prior existing compliance schedule time applied by the State of California, which for the Inland Surface Waters Plan and Enclosed Bays and Estuaries Plan was up to ten years and concerns from some dischargers that meeting the limits will take at least five years with EPA's view that the criteria be met as expeditiously as possible.

EPA believes that more than three years may be needed in some circumstances for a variety of reasons. EPA is concerned that in some cases, dischargers may need to implement new state-of-the art treatment technologies or pollution prevention programs. Also, evaluation, design and implementation of facility-wide comprehensive pollution prevention strategies involving product substitution, process line changes may require more than three years. Further, as discussed in the preamble to the proposed rule, the technical and administrative process of modifying and implementing revised requirements for numerous industrial users at POTWs, as well as planning budgeting and undertaking new construction to change treatment processes at a municipal treatment works may take more than three years. 62 Fed. Reg. 42187 (Aug. 5, 1997). Thus, EPA finds that a compliance schedule of five years is reasonable for the CTR.

EPA further notes that its permit regulations allow the use of interim limitations in conjunction with a compliance schedule or other mechanism such as a variance. 40 CFR 122.47.

With respect to comments suggesting that EPA's criteria do not protect designated uses see response to CTR-002-003 (Category C-24; Site-Specific Criteria). With respect to the comment that the CTR may degrade water quality in violation of antidegradation policy see CTR-002-010a (Category A;

Antidegradation) and CTR-039-004 (Category C-14;Fish/Water Consumption).

With respect to comments concerning environmental justice see response to CTR-002-005a (Category C-14; Fish/Water Consumption).

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

7. The proposed rule provides only a five-year compliance schedule to achieve compliance with the proposed water quality criteria. Again, setting aside the issue of whether water quality standards actually apply to municipal stormwater discharges, municipal stormwater programs are long-term, BMP-based programs. Because of this, it will take many years for a municipality to realize any water quality benefits in the receiving waters. The preamble to the proposed rule addresses all wet weather discharges together in one discussion. Municipal stormwater programs should be discussed and treated separately from all other wet weather and point source discharges. These are unique programs and cannot be placed in a "one-size fits all" regulatory program. The proposed rule needs to account for the nature of stormwater discharges by allowing more time for the MS4 long-term, BMP, source control program approach to take place for controlling pollutants in stormwater discharges.

We recommend that the rule be revised to provide a longer compliance schedule and to provide more flexible regulatory relief for MS4 dischargers who have fully complied with the MEP discharge standards but cannot achieve compliance within the established compliance schedule. At a minimum, the CTR should follow the recommendation of the State Task Force on the Inland Surface Water Plan to provide a 15-year compliance schedule.

Response to: CTR-013-007b

EPA is unwilling to extend the compliance period beyond five years because it has not received specific information indicating under what specific circumstances more than five years would be necessary to meet permit limits. Some municipalities supported the five year compliance schedule, while others argued that it was not sufficiently long. With respect to municipal stormwater discharges, permits are expected to require implementation of BMPs as the effluent limitations and that these BMPs are feasible within five years. Compliance schedules relate to what is necessary to meet the requirements of a particular permit limitation and EPA believes that meeting these limits is feasible within five years.

EPA supports the State in adopting a statewide provision independent of or as part of the current effort to readopt statewide water quality control plans, or in adopting individual basin-wide compliance schedule provisions through its nine Regional Water Quality Control Boards (RWQCBs). The State and RWQCBs have broad discretion to adopt a provision, including discretion on reasonable lengths of time for final compliance with WQBELs. EPA recognizes that practical time frames within which to set interim goals may be necessary to achieve meaningful, long-term improvements in water quality in

California.

EPA would prefer that the State authorize a compliance schedule provision but recognizes that it may not be able to complete this action for some time after promulgation of the CTR. Thus, EPA has chosen to promulgate the rule with a sunset provision which states that the authorizing compliance schedule provision will cease or sunset on September 30, 2004, or in approximately five years. However, if the State Board adopts, and EPA approves, a statewide authorizing compliance schedule provision prior to that time, EPA will expeditiously act to stay the authorizing compliance schedule provision in today's rule. Additionally, if a Regional Board adopts, and the State Board adopts and EPA approves, a Regional Board authorizing compliance schedule provision, EPA will act to stay today's provision for the appropriate or corresponding geographic region in California. At that time, the State Board's or Regional Board's authorizing compliance schedule provision will govern the ability of the State regulatory entity to allow a discharger to include a compliance schedule in a discharger's NPDES permit.

At this time, two RWQCBs have adopted an authorizing compliance schedule provision as an amendment to their respective Basin Plans during the Boards' last triennial review process. The Basin Plans have been adopted by the State and have come to EPA for approval. Thus, the Basin Plans' provisions are effective for the respective Basins. If and when EPA approves of either Regional Basin Plan, EPA will expeditiously act to amend the CTR, staying its compliance schedule provision, for the appropriate geographic region.

Comment: Schedules of Compliance (FR p. 42187, Preamble section F.5.)

It is mentioned that one Regional Board has adopted an authorizing compliance schedule provision in its Basin Plan and that, if the Agency includes a authorizing compliance schedule provision in this Rule, that Regional Board's provision will be recognized and effective. How would other Regional Boards get similar provisions into their Basin Plans, and what is the State Board's function, after this Rule is finalized? This discussion is confusing, as California state law already authorizes the use of schedules of compliance (Porter-Cologne Water Quality Act, Article 4, section 13263(c); California Code of Regulations, Title 23, Division 3, Chapter 91 section 2235.2). The discussion implies that, if the Agency does not include an authorizing compliance schedule provision in this Rule, that compliance schedules would not be allowed, which could impact the State Board's existing general authority and associated policies.

Response to: CTR-015-006

The CTR pre-empts any state law unless the state law is more stringent (Clean Water Act, Section 510).

The compliance schedule allowance in the CTR will be applicable wherever the CTR applies. If a Basin Plan includes a criteria (objective) for pollutant to which the CTR either does not apply or is less stringent, that Basin Plan must allow for compliance schedules in order for a compliance schedule to be included in the permit.

EPA would prefer that the State authorize a compliance schedule provision but recognizes that it may not be able to complete this action for some time after promulgation of the CTR. Thus, EPA has chosen to promulgate the rule with a sunset provision which states that the authorizing compliance schedule provision will cease or sunset on September 30, 2004, or in approximately five years. However, if the State Board adopts, and EPA approves, a statewide authorizing compliance schedule provision prior to that time, EPA will expeditiously act to stay the authorizing compliance schedule provision in today's rule. Additionally, if a Regional Board adopts, and the State Board adopts and EPA approves, a Regional Board authorizing compliance schedule provision, EPA will act to stay today's provision for the appropriate or corresponding geographic region in California. At that time, the State Board's or Regional Board's authorizing compliance schedule provision will govern the ability of the State regulatory entity to allow a discharger to include a compliance schedule in a discharger's NPDES permit.

At this time, two RWQCBs have adopted an authorizing compliance schedule provision as an amendment to their respective Basin Plans during the Boards' last triennial review process. The Basin Plans have been adopted by the State and have come to EPA for approval. Thus, the Basin Plans' provisions are effective for the respective Basins. If and when EPA approves of either Regional Basin Plan, EPA will expeditiously act to amend the CTR, staying its compliance schedule provision, for the appropriate geographic region.

Comment: State Compliance Schedule Provisions

We support the inclusion of compliance schedule provisions and would like EPA to clarify the statement that "any appropriately adopted Basin Plan amendment concerning a compliance schedule would also be effective for the Basin." In 1995, our Basin Plan was formally amended to include a compliance schedule provision (p. 4-14, (f)--see attached). The state review and approval process of those amendments has been completed and we have submitted the amendments to EPA for approval.

Our interpretation is that the regional compliance schedule provisions adopted in Basin Plans would take precedence over any compliance schedule provisions promulgated in the final rule by EPA and that EPA will either formally approve our Basin Plan prior to final rulemaking, or amend the proposed rule such that state-adopted compliance schedule provisions automatically take precedence at the time the final step in the approval process has been completed.

Comment: V. Schedules of Compliance

The CTR specifies that schedules of compliance are authorized, but only if the Basin Plan specifically allows the inclusion of schedules in permits. While the City generally agrees that schedules of compliance should be available for new requirements, we disagree that the authority for schedules of compliance must be specifically stated in a Basin Plan. The Porter-Cologne Act itself authorizes schedules of compliance and pursuant to the decision in the Star-kist Caribe, Inc., NPDES Appeal No. 88-5 (may 26, 1992), such authorization is sufficient to allow a schedule of compliance. Stockton agrees that a schedule of at least five years should be allowed. For complex pollution situations such as those related to storm waters, a longer period of compliance should be allowed because the available methods for pollution reduction will take much longer to implement and assess. As EPA allows up to twenty years for compliance for combined sewer overflows (a similar wet weather problem), a twenty-year period should be specified for storm waters.

Comment: Thank you for the opportunity to comment on the U.S. Environmental Protection Agency's (U.S. EPA) proposed California Toxic Rule (CTR). The State Water Resources Control Board (SWRCB) staff would like to recognize U.S. EPA's tremendous effort in producing the CTR. The SWRCB staff are providing you with the following comments:

Pages 42188 and 42208: State Compliance Schedule Provisions: The preamble indicates, if the CTR is adopted with compliance schedule provisions, any appropriately adopted basin plan provision authorizing compliance schedules would also be effective for the basin. We support this approach; however, it is not reflected in the wording of proposed Section 131.38(e).

In fact, at least two Regional Water Quality Control Boards have included compliance schedule provisions in their basin plans. These provisions allow compliance schedules of up to ten years in permits. In this respect the basin plan provisions are less stringent than the proposed rule. While the proposed rule states that "...where shorter schedules of compliance are prescribed or schedules of compliance are prohibited by law, those provisions shall govern", the rule does not clarify that existing basin plan provisions authorizing longer schedules are also effective.

Comment: 8. The proposed rule provides only a five-year compliance schedule to achieve compliance with the proposed water quality criteria. Again setting aside the issue of whether water quality standards actually apply to municipal stormwater discharges, municipal stormwater programs are long term BMP based programs. The proposed rule fails to recognize this, addressing all wet weather discharges together in one discussion. Municipal stormwater programs should be discussed and treated separately from all other wet weather and point source discharges. These are unique programs and cannot be placed in a "one-size fits all" regulatory program. The proposed rule needs to account for the nature of stormwater discharges by allowing more time for the MS4 long-term, BMP, source control program approach to take place for controlling pollutants in stormwater discharges.

The compliance schedule in the proposed rule discourages a watershed approach to improving water quality. The development and implementation of a watershed plan requires many years and many stakeholder involvements. However, the short compliance schedule in the CTR would actually encourage the discharger to forgo the watershed approach and address its toxicity issues separately and more expeditiously.

Recommendation: The rule should allow the State to establish compliance schedules. Short of this flexibility, the rule should be revised to provide a longer compliance schedule and to provide more flexible regulatory relief for MS4 dischargers who have fully complied with the MEP discharge standards but cannot achieve WQBELs compliance within the established compliance schedule. At a minimum, the CTR should follow the recommendation of the State Task Force on the Inland Surface Water Plan to provide a 15-year compliance schedule. Also provisions should be made for a longer compliance schedule when dischargers use a watershed approach to control toxic pollutants.

Response to: CTR-027-008b

See response to CTR-013-007b.

Further, in response to comments that EPA adopt a 15-year compliance schedule in order to accommodate schedules for developing TMDLS, EPA disagrees. The schedule for developing TMDLs is not relevant to compliance schedules; they are two totally separate issues. Compliance schedules address how long it will take in terms of technical or financial feasibility to meet an effluent limit established in an NPDES permit; they do not affect when the permit is issued. Moreover, while states may be adopting schedules for adopting TMDLs that extend up to 15 years, NPDES permits continue to be issued, even if this means they are issued before the TMDL is established for a particular waterbody. To do otherwise would be to stop the NPDES program until TMDLs are established. With regard to a situation in which a TMDL or watershed management program for the waterbody are scheduled for completion after the original compliance schedule has lapsed and justifiable delays in meeting WQBELs

arise, the discharger may apply for a variance from the water quality standard if the State develops an authorizing variance provision and the discharger meets the conditions set forth under 40 CFR 131.10(g).

The outside limit of ten years from the effective date of the rule means that dischargers whose permit is not renewed until the end of the ten year time frame will not be able to obtain a compliance schedule. EPA believes that this provision is nevertheless fair and reasonable for several reasons. First, based on the State's Implementation Plan [Reg. 9 put in correct title], EPA expects that the State will be able to reissue permits before the expiration of the ten year periods. Even if the State cannot do this, EPA thinks that ten years notice gives dischargers sufficient time to plan for meeting water quality based effluent limits, particularly given that the rest of the country has been subject since at least 1992 to such water quality standards either under state law or the National Toxics Rule ("NTR"). EPA promulgated the NTR for all states that did not have adequate criteria for toxic pollutants for which EPA had issued CWA section 304(a) criteria guidance.) Dischargers may also have sufficient notice because the State issued to many dischargers NPDES permits based on either the State's Inland Surface Waters Plan and Enclosed Bays and Estuaries Plan or narrative criteria similar to criteria in today's rule. Further, EPA also does not want to create an incentive for dischargers to have their permits re-issued later rather than sooner. Given the concern to have a level playing field among California dischargers, and those across the country who have all been subject to water quality criteria at least since 1992, EPA believes it is reasonable to cut off the compliance schedule for every discharger by ten years after the effective date of the rule.

Comment: D. EPA's Endorsement of Five-Year Compliance Schedules and Interim Permit Limits for Modifications is Appropriate

UWAG strongly supports EPA's recognition that modifications necessary to comply with new or more stringent effluent limitations may necessitate the use of five-year compliance schedules. 62 Fed. Reg. at 42,187, col. 3. UWAG believes, however, that in certain circumstances a longer compliance schedule may be appropriate. Steam electric facilities that need retrofits to meet water quality-based effluent limits (WQBELS) often require extensive engineering design and testing prior to the actual retrofit. Additionally, nuclear facilities must ensure that any design changes are compatible with Nuclear Regulatory Commission regulations. Therefore, the availability of five-year compliance schedules is certainly well-justified. Further, EPA should consider whether longer compliance schedules should be available, at least in some limited circumstances.

Additionally, UWAG strongly supports EPA's approval of interim permit limits for use in permit modifications. This flexibility will allow dischargers to stay in compliance while necessary process or

design changes are carried out.

Response to: CTR-030-004a

EPA appreciates these comments providing support for its compliance schedule provisions. With respect to EPA's decision on compliance schedule length see response to CTR-002-010b.

Comment: If the proposed rule is carefully and sufficiently modified to affirm a commitment by EPA to effect only its Congressional authorization as established by CWA section 402(p), then EPA's failure to assess municipal storm water dischargers" ability to attain the proposed standards and associated economic and environmental impacts may be set aside at this time. However, if EPA persists in maintaining the CTR as drafted in this regard, the ambiguities presented in the preamble demand serious consideration and analyses as follows.

a. Many of the criteria are not attainable or scientifically valid with regard to municipal stormwater dischargers, nor is the proposed approach consistent with an appropriate delegation of authority to the State.

iii. State Flexibility and Authority

The CTR states, "The criteria established in this section are subject to the State's general rules of applicability in the same way and to the same extent as are other Federally-adopted and State-adopted numeric toxics criteria when applied to the same use classifications..." p. 42206

This language supports State Water Resources Control Board decisions and the San Francisco Basin Plan which have made it clear that municipal storm water dischargers need to address water quality standards only through the implementation, and escalation as necessary, of best management practices. As noted previously, the language of this section must be better supported in the preamble.

Notwithstanding the above statement on page 42206, the CTR actually diminishes state flexibility in implementing the rule and is inconsistent with state compliance schedules. The CTR mandates implementation limits on the state and implies a 5-year limit on compliance.

A five-year compliance schedule for municipal storm water dischargers is entirely inconsistent with the State's, EPA'S, and Phase II stakeholder's understanding of the unique challenges of storm water permitting. The draft Phase II regulation submitted to OMB includes a comprehensive reevaluation of storm water programs after two permit terms, and recommends no added best management practices or

changes in the Phase II program until such evaluation and research are completed.

Comment: Regulatory Flexibility and Relief

The District supports EPA's use of "sound science" and current data in developing the proposed criteria in the California Toxics Rule (CTR). The District strongly supports language in the Preamble that references and endorses recommendations of the State Task Forces including use in permitting of:

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Response to: CTR-032-002i

EPA appreciates these comments providing support for its compliance schedule provisions.

Comment: * SCAP endorses the inclusion in the draft CTR of a provision authorizing the use of compliance schedules in NPDES permits. We agree with the rationale for its inclusion, since immediate and full compliance by dischargers simply is not always possible or practicable. We strongly urge EPA, however, to consider modifying this provision to authorize the issuance of permits containing compliance schedules of up to 15 years. While schedules that long need not always be granted, we believe that including the authority in the CTR would allow greater flexibility in crafting control strategies as EPA and the State implement watershed-based approaches, and would foster greater opportunities to pursue pollution prevention avenues before moving to extreme measures, such as advanced end-of-pipe treatment.

Comment: pp. 42187-42188 -- Schedules of Compliance We support the inclusion in the CTR of a provision authorizing the use of compliance schedules in permits, as authorized by the Clean Water Act. We agree with EPA's statement in the Preamble explaining the need for compliance schedule authorization, "because of the potential for existing dischargers to have new or more stringent effluent limitations, under the final rule, for which immediate compliance would not be possible or practicable." However, periods of time longer than 5 years may sometimes be necessary and appropriate. Consistent with the 1990 Starkist-Caribe Order, EPA has full authority to promulgate a compliance schedule provision, and there is no limitation in the Clean Water Act on the length of such a provision (U.S. EPA, 1990a). Therefore, based on the consensus recommendation of the Permitting and Compliance Issues Task Force, we urge EPA to allow up to 15 years for water quality standards to be met and to include a provision in the regulation stating that compliance schedules in NPDES permits for achievement of final effluent limitations based on the water quality criteria being promulgated may not extend beyond the compliance deadline for the standards (SWRCB, 1995, Part VI). The 5-year time frame assumes that a rapid response through source control, treatment plant operational changes, and/or major structural improvements is possible. However, once a decision is made to proceed with a project, planning, financing, design and construction can take more than 5 years. Further, we believe that a longer time frame may be suitable in cases where TMDLs are necessary and/or a watershed management program is underway but not complete. In such cases, it may make more sense for dischargers to pursue actions other than end-of-pipe treatment, such as monitoring, pollution prevention programs, water-effect ratio studies, investigation of pollutant trading opportunities, etc. (We also would like to point out that, in such cases, interim limits may be more appropriate than final effluent limits with compliance schedules.) This

is particularly true for pollutants which are not easily controlled (short of adding advanced treatment) through traditional industrial waste controls, and which must be reduced through new and innovative means (for instance, public education programs, installation of BMPs, etc.). A 15-year time frame is also consistent, we believe, with the guidance to EPA Regions issued by Assistant Administrator for Water Robert Perciasepe in August 1997, which directs States to submit schedules for developing TMDLs for all listed waters over an 8 to 13 year time period (U.S. EPA, 1997d). As this time frame does not include the implementation of measures to comply with Waste Load Allocations and Load Allocations to be developed through the TMDL process, we believe that even the 15-year time frame is optimistic for meeting water quality standards in all impaired water bodies, especially given the small number initiated in California to date and the large number of water bodies listed as impaired on California's 303(d) list.(*1)

(*1) 386 water bodies were listed by the state of California on the 303(d) list as of 1996 (SWRCB, 1996). Many of these water bodies were listed for multiple pollutants or stressors.

Comment: We are concerned that the five-year compliance period for stormwater discharges to meet the criteria is untenable. The linkage between the application of best management practices and water quality benefits is long term and will thus be hard to demonstrate. Even in a direct product substitution situation, such as the removal of leaded gasoline from fuels, data from Orange County shows a very slow and long-term reduction in lead concentrations in our water bodies over multiple years.

Comment: 11. EPA should provide for a compliance schedule of 15 years, consistent with the recommendation of the State Plan Public Task Forces, where dischargers with potential compliance problems are pursing watershed management and other reasonable activities. The Preamble discusses a number of reasonable and responsible actions that a discharger might pursue to address toxic pollutants including, but not limited to: monitoring of sources, discharges and ambient waters; development of best management practices; development of pollution prevention programs; optimizing treatment plant operations for toxics removal; dilution studies; translator studies; water-effect ratio studies; risk assessments; TMDL studies; investigation of pollutant trading opportunities; and conduct of watershed management studies. On the other hand, the proposed rule states that dischargers should generally be able to comply with the rule within 3 years and, at most, will be allowed a maximum of 5 years from the issuance of a permit to comply. These are obviously conflicting principles. Where dischargers are pursuing reasonable and responsible actions, such as those previously listed, the CTR should allow permit authorities to defer placement of final effluent limits based on CTR criteria in permits, and instead provide for interim permit limits consistent with the recommendations of the State Plan Public Task Forces. Also, consistent with the Task Force recommendations, the CTR should allow up to 15 years from the date of the rule to achieve compliance rather than the 10 years allowed in the proposed CTR. Such a provision would have the result of encouraging dischargers to participate in activities, such as watershed management, that will further the goals of the Clean Water Act, The presently proposed rule would have the effect of discouraging such activities.

Comment: On behalf of San Francisco BayKeeper, its Stockton-based DeltaKeeper project, San Diego BayKeeper and Santa Monica BayKeeper (hereinafter "BayKeepeer"), I am submitting these comments for consideration in finalizing EPA's proposed rule establishing water quality criteria for priority toxic pollutants for the waters of the State of California. The need for numeric criteria for priority toxic pollutants was identified by Congress ten years ago when, in October, 1987, it enacted amendments to the Clean Water Act mandating that States issue such criteria by not later than October 18, 1990. The State of California adopted a portion of the mandated criteria in April, 1991, which, in large part, EPA

approved. However, even that partial compliance was thwarted by the Sacramento Superior Court's overly broad decision vacating the State's decision based solely on a flawed economic analysis purportedly required by State law.

Now, seven years later, although appreciative of the complexity of the task required by Congress, BayKeeper is deeply concerned that EPA's proposed rule to cure the State's violation will undermine permit limits promulgated throughout the Bay area and other regions, allowing more pollution to be discharged to San Francisco Bay and other state waters in violation of the State and EPA's antidegradation policies. BayKeeper also is very concerned that EPA is promulgating criteria for mercury, dioxin and 13 other pollutants which are based on drastic underestimates of the quantity of fish consumed by recreational and subsistence anglers throughout the State of California. BayKeeper also believes that at this late date, the proposal to allow compliance schedules which could delay for up to ten years compliance with permit effluent limitations based upon the proposed criteria is inappropriate given the already seven year delay suffered by California's aquatic ecosystems and the people who depend upon the health of those systems for food and recreation.

V. EPA SHOULD NOT INCLUDE AUTHORITY FOR COMPLIANCE SCHEDULES IN ITS PROPOSED CRITERIA

As noted above, the proposed criteria, good or bad, are now seven years late. However, the State did have some criteria established for a three year period between 1991 and 1994. Thus, the regulated community has had ample notice of the criteria to come. indeed, a significant number of dischargers have been subject to permits based on approved criteria for upwards of five years. There is no scientific reason for EPA to perpetuate the delay and cause the State's aquatic ecosystems to further suffer toxic contamination that Congress mandated be addressed by October of 1990. Compliance schedules would be inconsistent with Congress' mandate. Moreover, compliance schedules would not be fair to those dischargers who already have been required to comply with the State's criteria issued in 1991. EPA should strike the compliance schedule authority from the proposed rule and leave the question of the need for compliance schedules to the State.

Response to: CTR-039-007

With respect to EPA's decision to include a compliance schedule, see response to CTR-002-010b. With respect to the relationship between EPA's compliance schedule and State adopted compliance schedules, see response to CTR-015-006. With respect to the comment that the CTR may degrade water quality in violation of antidegradation policy, see responses to CTR-002-010a (Category A; Antidegradation) and CTR-039-004 (Category C-14; Fish/Water Consumption). With respect to the comments on fish consumption, see response to CTR-002-002a (Category C-14; Fish/Water Consumption).

Comment: VI. Recommendation: Provide for a compliance schedule of 15 years, consistent with the recommendation of the State Plan Public Task Forces, where dischargers with potential compliance problems are pursuing watershed management and other reasonable actions.

* The Preamble discusses a number of reasonable and responsible actions that a discharger might pursue to address toxic pollutants including, but not limited to: monitoring of sources, discharges and ambient waters; development of best management practices; development of pollution prevention programs; optimizing treatment plant operations for toxics removal; dilution studies; translator studies, water-effect ratio studies; risk assessments; TMDL studies; investigation of pollutant trading opportunities; and watershed management studies.

* On the other hand, the proposed Rule states that dischargers should generally be able to comply with the Rule within 3 years and, at most, will be allowed a maximum of 5 years from the issuance of a permit to comply. These are obviously conflicting principles.

* Where dischargers are pursuing reasonable and responsible actions, such as those previously listed, the Rule should allow permit authorities to defer placement of effluent limits based on Rule criteria in permits, and instead provide for interim permit limits consistent with the recommendations of the State Plan Public Task Forces.

* Also, consistent with the State Plan Public Task Force's recommendations, the Rule should allow up to 15 years from the date of its promulgation to achieve compliance rather than the 10 years currently proposed. Such a provision would have the result of encouraging dischargers to participate in activities, such as watershed management and development of TMDLs, that will further the goals of the CWA. (In other documents, EPA has acknowledged that the TMDL process may take 8 - 13 years). The Rule, as it is presently proposed, will have the effect of discouraging such activities.

Comment: Compliance Schedules. WSPA supports EPA's recognition of the need for granting appropriate but flexible compliance schedules, with timeframes up to and including five years. This is especially true in cases when treatment technology is not available and must be developed to deal with a specific pollutant which has not been regulated in the permit previously.

WSPA members have detailed and intimate personal experience with the struggle and timeframe needed to come into compliance with highly restrictive and challenging water-quality based effluent limitations (WQBELs). WPSA and the SFRWQCB have collaborated on the detailed studies (which include studies of the significant secondary impacts) needed to meet the very stringent selenium limits set for Bay Area refineries. Selenium is a contaminant which typically occurs in refinery wastewaters at concentrations much less than 0.5 mg/L (roughly the practical level for heavy metal treatment technology when our studies begin). Its chemistry is very complex and was not well understood when industry began its studies.

The timeframe for the selenium studies and compliance schedule is as follows:

1. 3rd quarter 1992: WSPA members begin meeting to develop technology to meet RWQCB refinery selenium limits. Studies begin approximately the end of 1992.

2. 2nd quarter 1993: WSPA invites the RWQCB to participate in the selenium studies. Annual interim reports to RWQCB are made.

3. 3rd quarter 1995. The consolidated WSPA technology studies are completed and reported to the RWQCB.

4. 1995/1996. Individual refineries pilot the technology(ies) of their choice.

5. July 31, 1998: compliance deadline for new limits; meanwhile interim limits apply.

RWQCB staff participated in our assessment and development of available technology options. One of the primary reasons for the technology studies was to pursue alternatives to the iron coprecipitation process because this process generates vast quantities of potentially "toxic" solid waste (using California definitions). In addition to the WSPA coordinated studies, two refineries actively pursued other promising technologies specific to their facilities. These technologies were ultimately dropped due to technical deficiencies. Evaluating the alternatives took time and was a valuable part of the study even though, in the end, they did not workable results. In any case, the refineries still anticipate meeting the compliance deadline. We think the regulatory community would agree with us that even given the significant resources devoted to assessing the efficacy and appropriateness of various technologies, these studies take time to do well. However, to address complex and difficult WQBELS, this anecdote illustrates the need for permit writers to have the flexibility to work with dischargers on compliance schedules which in some cases may be very lengthy.

The use of compliance schedules is amply supported by existing regulations and practice, and makes for a practical approach to achieving the goals of the Act.

Comment: The Sanitation Districts supports the inclusion in the draft CTR of a provision authorizing the use of compliance schedules in NPDES permits. We agree with the rationale for its inclusion, since immediate and full compliance by dischargers simply is not generally possible or practicable. We strongly urge EPA, however, to consider modifying this provision to authorize the issuance of permits

containing compliance schedules of up to 15 years. We believe that including the authority in the CTR would foster greater opportunities to pursue pollution prevention avenues before moving to extreme measures, such as advanced end-of-pipe treatment. The ability to allow longer compliance schedules is especially critical, we believe, to the success of watershed management projects and the development of TMDLs (especially phased TMDLs).

Comment: PROVISIONS SDG&E DOES NOT SUPPORT

As described in the following comments SDG&E does not support the following provisions:

Compliance Periods No Longer than 5 Years

The preamble and rule describe the use of compliance schedules by existing dischargers where they find that they cannot immediately comply with a new more restrictive water quality based effluent limit (see 62 Fed. Reg. at 42187, Col. 1-3; and 62 Fed. Reg. at 42208, Col. 1-3). SDG&E supports the use of compliance schedules. However, the preamble and rule limit the term of compliance schedules to five years from the issuance of the new effluent limit. This duration may not be adequate where a TMDLA/VLA/LA process is necessary or may not accommodate the time needed to investigate alternative compliance methods, develop and obtain approval of site specific criteria, design and engineer necessary modifications to the facility and to obtain necessary financing. The SWRCB's Task Forces' Final Report ("Reports of the Public Advisory Task Forces to the State Water Resources Control Board Regarding the Development of the Inland Surface Waters Plan and the Enclosed Bays and Estuaries Plan"; October, 1995) recommended the use of compliance periods up to 15 years. SDG&E recommends that the rule be modified to allow for up to 15 year durations for compliance schedules.

Comment: * Having just completed an eight (8) year, twenty-eight (28) million dollar project to meet more stringent effluent limits, OVSD strongly endorses the inclusion in the draft CTR of a provision authorizing compliance schedules of up to 15 (fifteen) years in NPDES permits. Tremendous effort and time are required for a POTW to sample for and identify potential pollutants, negotiate the permit(s) with the applicable regulatory agencies, perform the necessary environmental studies to determine the impact of the pollutant(s) observed, identify potential solutions/mitigation measures and their costs, and then to design and build additional treatment facilities. Although 15 (fifteen) years may not always need to be granted, allowing the flexibility of extended compliance schedules would be very beneficial to OVSD (and other POTWs) and the Regional Water Quality Control Boards. This is true not only for the reasons stated above, but also because extended compliance schedules would allow time for the development and implementation of the relatively new watershed-based management approach.

Comment: * There are many aspects of the CTR that we support. These include: a) Application of interim limits while special studies are performed. b) Approach to water effect ratios for determining site specific criteria. c) Inclusion of provision for compliance schedules. However, this should be modified to allow inclusion of compliance schedules of up to 15 years in permits if deemed appropriate by Regional Boards. d) Metals criteria expressed as dissolved rather than total recoverable concentrations. e) EPA's guidance to Regional Boards regarding use of translators. f) EPA's proposal to create a rebuttal presumption for Water Effects Ratios, g) Revised human health criteria for mercury h) Decision to not promulgate human health criteria at this time in light of issues surrounding health criteria for arsenic. i) EPA's policies regarding application of mixing zones and dilution credits.

Comment: The subject rule has a significant impact on our facility discharge and the citizens of the City. We therefore present the following comments for your consideration to re-open the comment period for this rule in order to facilitate a more complete review by public and in particular by those in the POTW community:

* The inclusion of a provision allowing compliance schedules in permits in the rule, should be modified

to allow the Regional Water Quality Control Board's (RWQCB's) to include compliance schedule of up to 15 years if they deem it is appropriate.

Comment: Regulatory Flexibility and Relief

CDA supports language in the CTR Preamble that references and endorses recommendations of the State Task Forces including in part the use of.

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Comment: The draft California Toxics Rule (CTR) is clearly the product of substantial effort by USEPA staff, and we applaud this effort and its intent. On several issues of concern to public utilities, the CTR strikes a good balance between the need to promulgate standards and the need to base those standards on sound science. Examples include the use of dissolved concentrations rather than the total recoverable concentrations for metals, the deferral of human health criteria for arsenic until adequate information is available, and the revision of the human health criterion for mercury. We are also pleased with the CTR's guidance and flexibility, on mixing zones and dilution credits, total maximum daily loads (TMDLs), compliance schedules, and translators.

Response to: CTR-089-001f

EPA appreciates these comments for providing support for EPA's allowance of compliance schedules in NPDES permits.

Comment: There are many features of the proposed rule which we strongly endorse, specifically:

* the use of the latest IRIS values for human health criteria, it is essential that the criteria be based on the latest scientific and environmental information;

* recognition that the dissolved fraction of metals, rather than the total recoverable, better reflect the aquatic toxicity of metals;

* recognition that for certain metals (e.g. copper and zinc) ambient water chemistry is critical in determining toxicity thereby endorsing the Water Effects Ratio;

* recognition and strong endorsement of the multi-tiered mixing zones for acute, chronic and human health effects; and

* recognition of interim limits and compliance schedules as appropriate implementation strategies,

Comment: Compliance Schedules -- The PUC supports the use of compliance schedules as part of the NPDES permit process, however, we oppose establishing any ceiling in the CTR for the duration of such schedules. If water shed based solutions are to be implemented, these will require a much as a 10 to 15 years to begin to show significant results. it would be most unwise to burden small contributors of toxicants with large expenses, until such time as the efficacy of water shed approaches can be established in the specific water sheds.

Even in cases where there is a clear and immediate indication that a POTW will have to undertake significant process upgrading to achieve CTR based WQBEL effluent limitations, the five year period for compliance is simply unrealistic. It would be difficult for a municipality or regional sanitation agency to arrange financing, plan and undertake CEQA procedures, design, construct and run process shake down within five years for any major wastewater project.

Rather than incorporate a compliance schedule ceiling in the CTR, the CTR should simply state that compliance schedules can be established by the RWQCBs on a case by case basis.

Comment: Schedules of Compliance

The City endorses compliance schedules as an interim sequence of events which lead to compliance with water quality-based effluent limitations. The City further supports the authorizing compliance schedule provision contained in the CTR but advocates a period of 15 years to comply with such limitations. The 15 year time period is consistent with 1997 guidance issued by Assistant Administrator Robert Perciasepe regarding the development of TMDLs over an 8 to 13 year timeframe.

Comment: On September 17, I attended a hearing on the proposed CTR at the EPA's regional office in San Francisco. Here are some key issues from the testimony at that hearing:

* Some of the limits are below normal detection limits, therefore agencies have no background data in order to perform accurate attainability analysis.

* The cost of implementation by the EPA is grossly underestimated. The economic analysis shows at maximum implementation cost of $87 million. If preliminary estimates by publicly owned treatment works (POTW) art correct, implementation of the CTR will far exceed the $100 million provision of the Porter-Cologne Act. If this is the case, feasibility of implementation will be in jeopardy. The City of Merced, CA estimates that their additional cost would be $4 million annually. Merced has a very small treatment facility.

* Robert Reid, speaking on behalf of California Association of Sanitation Agencies(CASA), said that four San Francisco Plants estimate their total implementation costs to be $160 million annually.

* Charles Batts of Bay Area Dischargers Authority (BADA) estimated five BADA POTWs costs to be $12 million per year to meet the strict limit on copper and $56 million per year to meet the organics limit.

* The Regional Water Quality Control Board testified that San Francisco discharges twenty percent of the four percent discharged into the San Francisco Bay by POTWS, noting that POTWs are only a minor part of the volume discharged into the Bay. Thus, the reduction to the prescribed limits would cause a negligible decrease in the total mass of pollutants discharged.

* The City of Sacramento projects a $200 million annual cost will be required to meet the copper limit.

All of the testimony at the hearing echoed these concerns. I am sure that you have access to a transcript. The Clean Water Act has been and is instrumental in cleaning up our rivers, lakes, bay and estuaries. We can continue on this steady path by setting gradual attainable limits and through increased public education. Limits on pollutants should continue to get stricter, but this has to occur on a gradual curve that will not place an unreasonable burden on the individual taxpayer.

Comment: Next, compliance schedule.

EPA appears to be saying that it is only allowing state authorities to decide whether to put compliance schedules in permits which grant permission to pollute over the established criteria for up to 10 years.

However, we know that when the Unocal refinery here sued and paid the state authorities for permission to dump excess selenium for five years, EPA joined CBE, the City of San Francisco, the City of Richmond and others in court to support the public's right to protect our bay and protect our health.

Our question here is, has EPA waffled in its commitment to support our rights to be involved in a meaningful way in enforcement of water quality standards to protect our health?

Comment: MS. PLA: My name is Michelle Pla. I'm with the Public Utilities Commission, City and County of San Francisco.

I made the comment on my card that I also said that I would try to be constructive, and so I'm going to follow my mentor here, Phil Bobel, and say that there are some things in this rule that we're very pleased to see.

We're very pleased to see use of the latest scientific information, particularly the use of latest IRIS, I-R-I-S, numbers-for human health. We're very pleased that you're using dissolved versus total recoverable form for the metals.

We're very pleased to see recognition of the water effects ratios. We're pleased to see recognition for a multi-tiered mixing zone for acute and chronic human health effects and hope that the state pays particular attention to that.

We do have a problem with the way you've described compliance schedules and hope to be working strictly by the state on that as well. We think that the five-year system is fairly shortsighted, and -we can't even do FMDSLs in five years.

Comment: I've been saving the good news for last.

Fourth, and by no means last in priority for CASA, we wish to register our support for several parts of the preamble to the CTR.

We support application of interim limits in NPDES permits while TMDLs and other special studies are being performed.

We also support EPA's approach to water effects ratios for determining site-specific criteria.

We also support the inclusion of a provision allowing the compliance schedules in permits in the rule, although we recommend that it be modified to allow the regional boards to include compliance schedules of up to 15 years in permits, if they deem it appropriate.

Thank you for the opportunity to present our views. As I said earlier, we will be submitting detailed comments on the proposed rule by the end of the comment period, which hopefully will be extended in response to our and others' requests.

Comment: The compliance schedules, I would definitely question the need. There was a question reflected earlier, whether we need compliance schedules authorized by this federal rule.

It seems to me that EPA is trying to fix an absence of criteria. We have been waiting a long time for these criteria. They were supposed to be in place in -- it was '93, I think. The deadline, technically speaking, is about four years behind, and will probably be five by the time it's done.

To have another ten years before we actually see any results is a little frustrating, so I for one don't think compliance schedules, whether the agencies, for better or worse -- and with some help from the dischargers, they have not been able to issue the criteria required by federal law. And I guess the uncertainty of that delay should go to the benefit of the bay and all the waters of the state. So on compliance schedules, I think at this point they are a little bit too late, especially in the standards.

That's not to say in particular instances that the individual boards can't figure out ways of using enforcement authority to devise rational schedules where people for whatever reason have not been able to adjust the facilities to meet new standards.

But in the standards themselves, I think history shows that is not something that's going to cripple the various industries and dischargers, that it can be adjusted through enforcement processes.

Comment: 4) The use of the "harmonic mean flow" adds yet another level of conservatism to the standard setting process. As the response to the toxin is assumed linear with respect to concentration and additive over time, the use of this statistic seems inappropriate and overprotective.

Response to: CTR-003-004

EPA disagrees that the use of the harmonic mean flow is inappropriate and overprotective. Carcinogens, unlike non-carcinogens, do not have a threshold concentration where effects are only observed above certain concentrations. Exposure to carcinogens is best estimated by determining lifetime average exposure because carcinogens, as illustrated by the supporting toxicity data in the criteria documents, show a linear relationship of dose versus response. In other words, as exposure increases over time, a greater incidence of effects are observed. This means that exposure is cumulative over time. The human health criteria for carcinogens are based on the assumption of average exposure over a seventy year period (life expectancy assumption). The harmonic mean is the running average of all the flow data on record for a particular stream. EPA believes that averaging the entire flow record best approximates lifetime exposure. Thus, the Agency recommends the harmonic mean flow for determining long term exposure estimates when using steady-state modeling. EPA also notes that the final CTR does allow alternative flows to be used where supported by data and approved by EPA after EPA publishes for public comment a notice proposing such a change (40 CFR 131.38(d)(1)(iv)) . Appropriate dynamic modeling is one such alternative that EPA would approve. The final CTR maintains the harmonic mean flow as the design flow for human health criteria for carcinogens. EPA also notes the commentor did not provide an alternative to the harmonic mean flow.

Further discussion on the basis for the harmonic mean flow is contained in the Technical Support Document for Water Quality-based Toxics Control (section 4.6 and Appendix D) and in "Design Stream Flows Based on Harmonic Means," Lewis A. Rossman, Jr. of Hydraulic Engineering, Vol. 116, No. 7, July 1990.

Comment: II. Use of New Scientific Information

The City acknowledges and supports EPA's update of several water quality criteria including those for mercury, cadmium and arsenic. While a number of criteria were updated to reflect current scientific information, there are a few notable exceptions.

The following briefly addresses the key updates and omissions that should be addressed in the final publication of this rule.

5. Application of Criteria at Return Flows

The rule specifies that the criteria should be applied under various design flows that properly represent the acceptable exposures that may occur in the environment. Consistent with the National Guidelines, EPA recognized that it is inappropriate and unnecessary to apply the criteria in a "never to exceed" manner. Clearly, the information underlying the selection of the return frequency of once in three years, which was conservatively derived, demonstrates that periodic exceedance of the criteria is acceptable. However, in the rule, EPA states that these flows should only be used if the Regional Board has expressly determined that water quality criteria apply only above certain flows. Absent such a statement from the Regional Board, the criteria apply at all flows and no exceedance, no matter how minor, would be allowed. This provision (which will clearly lead to overly stringent application of criteria) is arbitrary and capricious.

If EPA is to adopt criteria and implementation procedures in place of state action, that regulatory package must be complete and appropriate considering the regulation as a whole. EPA is well aware that few Regional Boards have established specific return flows because the issue is addressed on a case-by-case basis. Moreover, as no specific flow is set to apply to wet weather events, the CTR would lead to the absurd conclusion that storm waters, prior to mixing with any surface waters, must comply with stringent water quality criteria.

EPA may not knowingly establish procedures that will lead to unnecessarily restrictive application of the criteria unrelated to actual use protection needs. The final rule should specify the criteria will only be applied to flows exceeding the design stream flows specified in the rule.

Response to: CTR-020-016

EPA disagrees that the low flow provisions in this rule are arbitrary and capricious. EPA notes that under the Water Quality Standards Regulation (see 40 CFR 131.13), States may adopt discretionary policies that affect the implementation of their water quality standards. Such policies may include the establishment of low flow provisions and are subject to EPA review and approval. However, where a State has not specified low flow provisions and has determined that the application of the criteria at all flows is appropriate State policy, EPA will defer to the State's expressed policy. This approach is consistent with Section 510 of the Clean Water Act which preserves State authority to adopt provisions for its waters that are more stringent than required by EPA.

Furthermore, EPA disagrees with the commenter's assertion that if a State's criteria apply at all flows, the

criteria could never be exceeded. EPA's aquatic life criteria are based on three interrelated components which include magnitude, duration, and frequency. EPA's longstanding position is that the criteria may not be exceeded more than once every three years on the average. This recurrence frequency takes into consideration the rates of ecological recovery from severe environmental stresses. Further discussions on this issue is contained in EPA's Technical Support Document for Water Quality-based Toxics Control (Chapter 2 and Appendix D).

CROSS REFERENCES T

Comment: 5. The proposed rule restricts the State's regulatory flexibility in permitting by establishing averaging periods and low flow conditions, and directives regarding establishing effluent limits for criteria not being adopted as part of the CTR. USEPA has preempted the State's flexibility by establishing averaging periods for applying acute and chronic aquatic life and human health criteria, and by establishing low flow conditions that must be used in developing limits based on proposed criteria. These are implementation issues that should remain with the State regulatory authority.

Recommendation: The rule should be revised to delete all provisions that preempt the State's regulatory flexibility.

Response to: CTR-027-005a

EPA disagrees that the flow provisions contained in the final rule will limit State flexibility.

First, EPA notes that the State of California may develop alternative design flows for its waters provided that those alternative flows are scientifically defensible and protective of the designated uses of State waters. Such alternative flows will be subject to EPA review, approval, and public comment. However where the State has not adopted low flow provisions, the design flows specified in today's rule shall be implemented to ensure that the criteria will be implemented appropriately to provide environmental and human health protection.

As noted in the preamble of today's rule, EPA's Technical Support Document for Water Quality-based Toxics Control (the TSD) also recommends the use of dynamic models to perform wasteload allocations. EPA is clarifying that today's rule provides the State of California with the flexibility to utilize dynamic models to implement the federal criteria. The dynamic modeling techniques, as outlined in the TSD, will allow enable the determination of wasteload allocations that will meet the criteria in today's rule.

Comment: pp. 42182-42183 -- Low Flow Values for Streams and Rivers We recommend that EPA not adopt the design flow values (e.g. 1Q10 or 1B3 for aquatic life acute criteria) for the CTR criteria. The values specified are not always appropriate. For instance, EPA proposes that the harmonic mean flow be applied with human health criteria for carcinogens. In contrast, EPA's Technical Support Document (U.S. EPA, 1991) states:

"However, for situations involving seasonally variable effluent discharge rates, hold-and-release treatment systems, and effluent-dominated sites, the harmonic mean may not be appropriate, In these cases, the effluent load and downstream flow are not independent (i.e., they are correlated). Modeling techniques can calculate an average daily concentration over a long period of time are more appropriate to determine the long-term exposure in these cases." Therefore, we recommend that EPA include these values in the Preamble as guidance instead of in the rule itself.

Response to: CTR-035-029

EPA agrees that the low flow values specified in the rule may not be appropriate in all instances as noted in the Agency's Technical Support Document for Water Quality-based Toxics Control (the TSD). Furthermore, EPA noted in the proposed rule (see section 131.38(c)(2)(ii)) that the low flows would apply in waters suitable for the establishment of low flow return frequencies such as free flowing streams and rivers. However, in general, EPA supports these flows as being appropriate in a majority of situations. Additionally, as noted in the preamble of today's rule, EPA is clarifying that today's rule provides the State of California with the flexibility to utilize dynamic modeling (as an alternative to steady state modeling) in implementing the criteria contained in today's rule. Therefore, EPA will retain the design flows as proposed, as these flows will ensure adequate implementation of the criteria included in today's rule in cases where the State does not have design flows in place or where the State does not utilize dynamic modeling.

Comment: 5. EPA is requiring, by rule, that 1Q10 and 7Q10 receiving water flows be developed to implement acute and chronic water quality standards. This will therefore eliminate any flexibility that the State wishes to use when calculating reasonable potential to exceed standards and water quality-based limits. This will also limit permittees as to the approaches that can be used when modeling mixing zones. The use of 1Q10 and 7Q10 values is arbitrary and is not related in any way to how water quality criteria are developed or protection of the environment. These statistics were adopted merely because they were already in use by other programs and were therefore easily obtained. Use of these statistics does not recognize unique qualities of California's or any other states's waters, and therefore does not preclude overly stringent regulation. EPA must justify with data why these particular flows are required to implement water quality standards and why designated uses will not be protected if these flows are not used in NPDES permitting.

Response to: CTR-037-005

See response to CTR-027-005a. EPA disagrees that the 1Q10 and 7Q10 values are arbitrary. The hydrological basis for these flows were taken directly from EPA's Technical Support Document for Water Quality-based Toxics Control (See TSD, Appendix D for further information).

Comment: V. Recommendation: Delete all provisions in the Rule that preempt the States flexibility in permitting. The Rule provides specific direction on the adoption of averaging periods, low flow values, effluent limitations for criteria not being adopted as a part of the Rule, and that the aquatic life criteria be applied to all waters irrespective of designated use, etc..

* The Preamble and the Rule's economic analysis make a point that the State has considerable flexibility in establishing permit limitations. In making, that point, EPA implies that the State may implement the criteria in a manner that would have little or no adverse economic impact on dischargers.

* However, the Rule contains a number of implementation provisions that are not required under Section 303(c)(2)(B), but serve to preempt the State's flexibility. These provisions include, but are not necessarily limited to the adoption of averaging periods and low flow values, directives regarding the establishment of effluent limitations for criteria that are not being adopted as a part of the Rule, and application of the aquatic life criteria to all waters irrespective of the designated use.

* Not only does EPA not have a duty to adopt these provisions, but also the provisions are more restrictive than those required by the CWA or EPA regulations, They clearly restrict the State's flexibility. In fact, other states have adopted, and EPA has approved, implementation provisions (e.g., averaging periods and low flow values) which are less restrictive.

* For these reasons, EPA should remove all such implementation provisions from the Rule.

Comment: Thirdly, I'd like to touch upon implementation of the rule. My understanding is that the state's Inland Surface Waters and Enclosed Bays and Estuaries Plan will address implementation of the CTR. With this in mind, the CTR should serve as an enabling rule and allow the state and the dischargers flexibility in the implementation of objectives contained in the rule.

As I touched upon earlier in my opening remarks, EPA has included some enabling provisions in this rule that we support, such as use and determination of mixing zones and water effects ratios. From the stormwater perspective, we believe other important enabling provisions must be included to allow for regional flexibility in the implementation of our stormwater programs.

For example, enabling provisions should be included to allow flexibility in establishing compliance schedules for stormwater discharges and should allow flexibility for site-specific establishment of low-flow conditions and wet weather standards, and ranges of human health criteria depending on the use of individual receiving waters.

Comment: 5) The concept of interim permit limits is a worthy one which we hope you retain.

Response to: CTR-003-005

EPA appreciates these comments providing support for EPA's discussion of interim limits in the preamble of the proposed CTR. EPA addressed some implementation issues in the preamble to the proposed rule to illustrate the discretion available to the State in its issuance of permits and effluent limits, however, this implementation issue is outside the scope of the rule. EPA supports the State's consideration of stakeholder Task Force recommendations in developing the State's policy (Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California) regarding interim limits. However, EPA is not recommending any specific method of calculating interim limits because EPA does not intend to limit the State's discretion in implementing the Clean Water Act.

Comment: Comments of the Utility Water Act Group on the Proposed California Water Quality Standards

The Utility Water Act Group (UWAG)(*1) submits these comments on EPA's proposed Water Quality Standards for the State of California, published in the Federal Register on August 5, 1997. (62 Fed. Reg. 42,160) (the California proposal). UWAG is interested in the proposed regulation because: (1) UWAG member companies in California will be directly affected by the proposed changes to the California water quality standards; and (2) many of the issues raised in the proposal have national implications, particularly as they relate to general implementation of the NPDES program.

As detailed in Section I below, UWAG finds many parts of the proposal reasonable and sensible, and endorses EPA's intentions as to those parts. However, as explained in Section 11, the proposal sets forth some propositions that are erroneous or technically deficient, and others that may lead to inappropriate implications or misinterpretations.

I. ISSUES UWAG SUPPORTS

A. UWAG Approves of Interim Permit Limits When a TMDL Study is Incomplete

UWAG agrees with EPA that interim permit limits - where WQBELs have otherwise been justified - are appropriate for pollutants that are the subject of an ongoing TMDL/WLA/LA or other special study. 62 Fed. Reg. at 42,185, col. 2. UWAG also agrees that past performance and future uncertainty are appropriate factors - although not the only possibly relevant factors to consider in determining interim permit limits. UWAG wishes to emphasize, however, that permit writers must not be encouraged to impose any WQBELS, including interim WQBELS, until they have obtained sufficient and reliable data with which to conclude that the discharge has a reasonable potential of causing an excursion of water quality standards. In short, EPA should emphasize in the final rule that interim limitations are not intended to supersede the obligation of a permit writer to perform a reasonable potential determination as a prerequisite to imposing a WQBEL.

(*1) UWAG is an association of 73 individual electric utilities and three national trade associations of electric utilities, the Edison Electric Institute, the National Rural Electric Cooperative Association, and the American Public Power Association. The individual utility companies operate power plants and other facilities that generate, transmit, and distribute electricity to residential, commercial, industrial, and institutional customers. The Edison Electric Institute is the association of the nation's investor-owned electric utilities. The National Rural Electric Cooperative Association is the association of nonprofit electric cooperatives supplying central station service through generation, transmission and distribution of electricity to rural areas of the United States. The American Public Power Association is the national trade association that represents publicly owned electric utilities in the United States. UWAG's purpose is to participate on behalf of its members in EPA's rulemakings under the CWA and in litigation arising from those rulemakings.

Response to: CTR-030-001

EPA agrees that the permit writer must have a reasonable basis to conclude whether the discharger has "reasonable potential" for causing or contributing to an excursion of an objective prior to setting water quality-based effluent limits. EPA addressed some implementation issues in the preamble to the proposed rule to illustrate the discretion available to the State in its issuance of permits and effluent limits, however, this implementation issue is outside the scope of the rule.

Comment: D. EPA's Endorsement of Five-Year Compliance Schedules and Interim Permit Limits for Modifications is Appropriate

UWAG strongly supports EPA's recognition that modifications necessary to comply with new or more stringent effluent limitations may necessitate the use of five-year compliance schedules. 62 Fed. Reg. at 42,187, col. 3. UWAG believes, however, that in certain circumstances a longer compliance schedule may be appropriate. Steam electric facilities that need retrofits to meet water quality-based effluent limits (WQBELS) often require extensive engineering design and testing prior to the actual retrofit. Additionally, nuclear facilities must ensure that any design changes are compatible with Nuclear Regulatory Commission regulations. Therefore, the availability of five-year compliance schedules is certainly well-justified. Further, EPA should consider whether longer compliance schedules should be available, at least in some limited circumstances.

Additionally, UWAG strongly supports EPA's approval of interim permit limits for use in permit modifications. This flexibility will allow dischargers to stay in compliance while necessary process or design changes are carried out.

Comment: Regulatory Flexibility and Relief

The District supports EPA's use of "sound science" and current data in developing the proposed criteria in the California Toxics Rule (CTR). The District strongly supports language in the Preamble that references and endorses recommendations of the State Task Forces including use in permitting of:

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Comment: Second, we commend EPA for its inclusion in the CTR of several innovative and flexible regulatory approaches, such as metals criteria expressed as dissolved rather than total recoverable concentrations, and the revised human health criterion for mercury. In addition, in light of the issues surrounding the human health criteria for arsenic we support EPA's decision not to promulgate human health criteria at this time. With respect to implementation issues discussed in the Preamble, we support EPA's policies and guidance regarding the application of mixing zones and dilution credits. the use of interim permit limits while Total Maximum Daily Loads (TMDLs) and other special studies are being performed, and EPA's guidance to Regional Water Quality Control Boards (RWQCBs) that they may use any of the methods described in EPA's guidance document on the use of translators. We also support EPA's proposal to create a rebuttable presumption for Water Effects Ratios (WERs), allowing the RWQCBs and SWRCB to develop site-specific WERs that can be approved by EPA during the NPDES permit approval process. We believe that this approach will help facilitate the development of appropriate site-specific adjustments for metals criteria.

Comment: p. 42185 -- Interim Limits We support the inclusion of the provision in the Preamble which supports the use of interim limits in NPDES permits while TMDLs and other special studies are being performed. We endorse the recommendation of the Permitting and Compliance Issues Task Force that interim effluent limits be calculated based on past performance plus future uncertainty (SWRCB 1995, Part VI). While recognizing that the State has discretion in determining how effluent limits are calculated, we recommend that EPA strengthen its statement of support for this approach by recommending its use to State permitting authorities.

Comment: VI. EPA'S SUGGESTION THAT "INTERIM PERMIT LIMITS" MAY BE ACCEPTABLE IS WITHOUT AUTHORITY IN THE LAW

EPA refers to a suggestion of the State's Permitting Task Force that performance-based interim permit limits may be appropriate where a TMDL/WLA/LA is underway but not yet completed. 62 Fed. Reg. at 42185. This innovative concept has one fatal flaw --- there is no authority for such limits in the Clean Water Act. Indeed, the notion of an interim limit is inconsistent with other important features of the Act.

First, by definition, an effluent limitation must be designed to meet all applicable water quality standards. Interim limits, by definition, would not be designed to assure compliance with standards. Where a

TMDL is underway and presumably pertinent to a Proposed "interim" limit, the waterbody by definition is not meeting an applicable standard. An interim limit, by definition, is deferring the limit which would be required of the particular discharger to meet that standard.

Second, interim limits are a veiled attempt to sidestep the regulatory restrictions placed on compliance schedules. Where authorized, compliance schedules are limited to 5 years and must include interim steps if they are longer than one year. "Interim" limits is simply a way of creating a compliance schedule without the appropriate label. As a result, the proposal appears to contemplate potentially open-ended schedules with none of the limited safeguards provided by compliance schedules. In other words, an interim limit is nothing but an illegal compliance schedule. When included in conjunction with a compliance schedule, as set forth in another section of the proposed rule, BayKeeper is not concerned with the notion of an interim effluent limit (albeit, as noted above, neither is appropriate for inclusion in this proposed rule). 62 Fed. reg. 42208.

Third, the need for interim limits in order to wait for unfinished TMDLs is an extremely flimsy policy reason for creating a new genre of permit limits. Section 303(d), 33 U.S.C. section 1313(d) has required TMDLS for well over a decade. States, including California, as well as EPA simply have refused to comply with that legal obligation. Simply because the agencies have chosen to ignore Congress' mandate is not a valid reason for EPA or the State of California to undermine other sections of the Act, such as the process for establishing effluent limits and compliance schedules.

The reference to interim limits while waiting for TMDLs included in the preamble should be stricken. Should the State choose to authorize compliance schedules, that should be the only process by which a discharger can defer compliance with a water quality-based effluent limit. There is no reason that a schedule of a couple of years but not greater than 5 years would not be ample time to complete a required TMDL process.

Response to: CTR-039-008

EPA disagrees that there is no authority for interim limits in the Clean Water Act.

See response to CTR-002-010b (Category G-02; Compliance Schedules).

Comment: We have reviewed the proposed CTR and offer the following comments:

2. The following provisions of the rule are supported:

(1) adoption of metals criteria as dissolved concentrations;

(2) expression of the metals criteria as a function of the water-effect ratio;

(3) adoption of the proposed new human health criteria for mercury; and

(4) the Preamble discussions regarding metals translators, mixing zones, and interim permit limits.

Were the old human health criterion for mercury (0.012 ug/ l) to be adopted, the City would have to remove its discharge from Tule Canal and go to land disposal. The capital cost to do this would be $22.1 million and the total present worth cost would be $23.1 million (see Exhibit B, Required Capital improvements and Costs for Beryllium and Mercury). This would translate to an annual cost of $3.1 million per year (at 7% over 10 years) and would require that monthly sewer service charges be increased by more than 100%.

Response to: CTR-044-003f

See response to CTR-003-005.

With respect to the comment about the economic impact of the old criterion for mercury 0.012 ug/l, EPA has not evaluated these costs since the CTR does not promulgate a mercury criteria of 0.012 ug/l.

Comment: BADA supports the Preamble discussions regarding metals translators, mixing zones, and interim permit limits. Translators and mixing zones will provide a better scientific basis for the application of the criteria and will go a long way toward protecting against the imposition of unnecessary or unreasonable controls. Interim permit limits will allow dischargers faced with potential attainability problems to pursue reasonable actions, such as pollution prevention, treatment plant optimization, pollutant trading, TMDLS, etc. prior to being faced with final effluent limitations. BADA endorses the recommendation of the State Plan Public Task Forces on the issue of interim limits.

Comment: PROVISIONS SDG&E SUPPORTS

EPA has included in the proposed CTR provisions which are reasonable and with which SDG&E supports. These include:

Interim limits

The preamble discusses the use of interim numeric limits during the time which TMDL/WLA/LA or other special studies are underway but not completed (see 62 Fed. Reg. at 42185, Col. 2). SDG&E agrees that interim limits are appropriate and supports their use. Also, interim limits should be set such that existing discharges can maintain compliance during the interim period.

Comment: Regulatory Flexibility and Relief

CDA supports language in the CTR Preamble that references and endorses recommendations of the State Task Forces including in part the use of.

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Comment: There are many features of the proposed rule which we strongly endorse, specifically:

* the use of the latest IRIS values for human health criteria, it is essential that the criteria be based on the latest scientific and environmental information;

* recognition that the dissolved fraction of metals, rather than the total recoverable, better reflect the aquatic toxicity of metals;

* recognition that for certain metals (e.g. copper and zinc) ambient water chemistry is critical in determining toxicity thereby endorsing the Water Effects Ratio;

* recognition and strong endorsement of the multi-tiered mixing zones for acute, chronic and human health effects; and

* recognition of interim limits and compliance schedules as appropriate implementation strategies,

Comment: Interim Limits

The City supports the concept of interim numeric permit limits when a TMD or other special investigation is underway but not yet completed. The City supports the discussion of factors applicable to the derivation of interim numeric permit limits, specifically past treatment performances, future uncertainty, receiving water body attainment and water quality. The City further encourages flexibility and innovation as illustrated by the concept of effluent "trigger concentrations".

Comment: I've been saving the good news for last.

Fourth, and by no means last in priority for CASA, we wish to register our support for several parts of the preamble to the CTR.

We support application of interim limits in NPDES permits while TMDLs and other special studies are being performed.

We also support EPA's approach to water effects ratios for determining site-specific criteria.

We also support the inclusion of a provision allowing the compliance schedules in permits in the rule,

although we recommend that it be modified to allow the regional boards to include compliance schedules of up to 15 years in permits, if they deem it appropriate.

Thank you for the opportunity to present our views. As I said earlier, we will be submitting detailed comments on the proposed rule by the end of the comment period, which hopefully will be extended in response to our and others' requests.

Comment: Some of the flexibility that the City highly supports is the water effect ratio investigations to adjust statewide criteria to site-specific conditions; the interim limits concept while special studies are being conducted by the dischargers and other entities; a variance procedure to allow dischargers to achieve progress toward effluent limit attainment without violating applicable water quality standards; dissolved criteria for metals to reflect the toxicological conditions; translators to adjust dissolved criteria to total permit limitations; trading programs to attain and maintain water quality; and a mixing zone that reflects true instream pollutant conditions and that protects beneficial uses.

Comment: Alternative Mixing Zones

One of the few avenues that may actually provide some regulatory relief is mixing zones. The Preamble to the CTR describes a mixing zone as a limited area or volume of water where initial dilution of a discharge takes place and where water quality standards can be exceeded. Mixing zones have been applied in the water quality standards program since its inception. The present water quality standards regulations allows states to adopt acute and chronic mixing zones as a matter of state discretion, so long

as the state's mixing zone protects the designated uses. See 40 C.F.R. section 131.13.

The Preamble recognizes that several California Regional Water Quality Control Boards have adopted mixing zone provisions in their respective Basin Plans. These mixing zone provisions can be applied to discharges to water bodies to which water quality standards based on the criteria contained in this proposed rule will apply once this mile becomes final. See CTR Preamble at pg. 42185. The problem arises for the proposal or adoption of new mixing zones where one is not currently authorized under an existing Basin Plan. The Preamble sets out numerous restrictions on the use of mixing zones, as follows:

A mixing zone should be established to ensure that the zone will riot impair the integrity of the water body as a whole, the zone will not cause lethality to passing organisms, and, considering- likely pathways of exposure, that there are no significant human health risks. For application of two-number aquatic life criteria, as proposed in this rule, there may be up to two types of mixing zones. In the zone immediately surrounding the outfall, neither the acute nor the chronic criterion is met. The acute criterion is met at the edge of this zone. In the next mixing zone, the acute, but not the chronic, criterion is met, The chronic criterion is met at the edge of the second mixing zone. However, since both aquatic life and human health criteria are proposed in today's rule, the state may establish independent mixing zone policies for each. For any particular pollutant from anyparticular discharge, the magnitude, frequency, duration and mixing zone associated with each of the type of criteria may determine which one most limits the allowable discharge. Id.

The other potential problem arises because state-adopted mixing- zones are subject to EPA review and approval . See 40 C.F.R. section 131.13. Because EPA approval is required, the question arises whether a federal rulemaking would accompany approval of mixing zones as it does with approval of state variances (which are also authorized under 40 C.F.R. section 131.13). If so, this would greatly restrict the utility of new or alternative mixing zones as an avenue for regulatory relief.

(*1) This cost trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario, See EA at pg. 4.

(*2) In addition, pollutant load I reductions word not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

Response to: CTR-004-009

Mixing zone and dilution policies and implementation procedures are used by States to establish water quality based discharge limitations that protect the integrity of a waterbody as a whole, but provide permittees a reasonable avenue of relief by allowing ambient concentrations above water quality criteria in small areas near outfalls. EPA is not promulgating a mixing zone and dilution policy for California as part of this rulemaking. This is because EPA maintains that the decision regarding whether to adopt a mixing zones and dilution policy is made at the discretion of the State (see 40 CFR 131.13). While adopting a mixing zone and dilution policy is an area of State discretion, EPA retains authority to review and approve or disapprove policies which affect the application and implementation of water quality standards.

The CTR preamble reiterates existing EPA guidance contained in the Technical Support Document for Water Quality-based Toxics Control (1991) and the Water Quality Standards Handbook (1993) regarding the use of mixing zones and dilution by States. In accordance with this guidance, allowable mixing zone characteristics should be established to ensure that: (1) mixing zones do not impair the integrity of the

water body as a whole; (2) there is no lethality to organisms passing through the mixing zone; and (3) there are no significant health risks, considering likely pathways of exposure. To assist States in establishing appropriate mixing zones and dilution policies and procedures, EPA-Headquarters has periodically issued technical guidance on this topic. National EPA guidance can be found in the Technical Support Document for Water Quality-based Toxics Control (1991), the Water Quality Standards Handbook (1983 and 1993) and Quality Criteria for Water (the "Red Book", 1976). Other sources of information and guidance include Water Quality Criteria 1972 (the "Blue Book", National Academy of Sciences). At minimum, State mixing zone and dilution policies must be consistent with the EPA water quality standards regulation which requires the protection of designated uses. EPA received a majority of comments in support of the mixing zone and dilution discussion in the CTR preamble, which includes a review of the application of mixing zones and dilution in setting allowable discharge limitations based on acute, chronic, and human health criteria using a multi-tiered approach.

As discussed previously, under EPA's water quality standards regulation, States may adopt policies authorizing the use of mixing zones and dilution in setting TMDLs and water quality based effluent limitations (see 40 CFR 131.13). Pursuant to federal regulation, the decision regarding whether to allow mixing zones and dilution is made by individual States (i.e., States may elect to allow or to prohibit mixing zones/dilution for purposes of water quality based permitting). Where a State elects to allow mixing zones and dilution, the State must include an authorizing policy in its water quality standards regulation (e.g., see Water Quality Control Plan for Ocean Waters of California, California Ocean Plan, State Water Resources Control Board, 1997). Where a mixing zone and dilution policy is not sufficiently specific for EPA to adequately evaluate its implementation, the State must also establish procedures to be followed in implementing its mixing zone and dilution policy. Such mixing zone and dilution policies and implementation procedures are subject to EPA review and approval, as new or revised water quality standards (see 40 CFR 131.13). Courts have held that EPA is not required to undertake notice and comment procedures before approving State water quality standards. City ofAlbuquerque v. Browner, 865 F. Supp. 733 (D. N.M. 1993) (The Court noted that EPA is specifically required to provide notice and take comment before issuing federal water quality standards under section 303(b) and held that '[i]f Congress wanted the agency to provide additional notice upon approving state standards, it could have included that language in Section 303(c)(1)," aff'd, 97 F.3d 415, 425, n. 15 (10th Cir. 1996), cert. denied, 1997 US LEXIS 6709 (Nov. 10, 1997). State decisions regarding the application of mixing zones and dilution to specific point source discharges are subject to EPA review through the NPDES permitting process.

EPA will continue to support the State's establishment of technically defensible mixing zone and dilution policies and implementation procedures, consistent with EPA's water quality standards regulations and guidance, and their application in setting TMDLs and water quality based effluent limitations for acute, chronic, and human heath criteria.

Therefore, since EPA will approve reasonable implementation of mixing zones, EPA believes its Economic Analysis properly included mixing zones as one of several areas of potential regulatory relief for dischargers.

Comment: Mixing Zones (FR p.42185, Preamble section F.3.)

Mixing zones are defined by states. At this time, California does not have mixing zones at any state-level plan (Note: they were in the plans that were rescinded). The Agency mentions that several Regional Boards have mixing zone provisions in Basin Plans. The Agency states that it will recognize those provisions as they are applied to the water quality criteria contained in the Rule. Will the Agency recognize mixing zones should other Regional Boards adopt provisions from this time forward, especially if the State Board does not adopt a state-wide mixing zone definition and associated provisions in a timely manner, or at all?

Response to: CTR-015-004

In the absence of a state-wide policy on mixing zones, EPA will recognize any mixing zone provision that has been adopted by the Regional Board within its basin plan consistent with State law and is approved by EPA as consistent with the Clean Water Act.

Comment: III. Mixing Zones

The CTR specifies that mixing zones are allowed on a case-by-case basis if authorized by the applicable Basin Plan and approved by the Regional Board for individual permits. In general, the rule should state that consideration of mixing should also apply to storm waters where dilution is certain to exist.

Response to: CTR-020-019

The State has discretion to allow (or deny) mixing zones in ambient waters that would apply to any NPDES discharger including storm water.

Comment: PROVISIONS OF THE PROPOSED RULE WE SUPPORT

Not withstanding the above comments, we believe there are certain elements of the proposed rule with respect to establishing water quality standards that we can support:

* Metal criteria expressed in the dissolved fraction rather than expressed in the total recoverable fraction.

* Metal criteria that are developed as a function of the water-effect-ratio (WER).

* The current proposed human health criterion for mercury.

* The current preamble language regarding metal translators and mixing zones.

We believe the above provisions provide a more acceptable, scientific approach to the water quality-based pollution control approach. We recommend these provisions of the current rule remain as proposed.

Comment: Second, we commend EPA for its inclusion in the CTR of several innovative and flexible regulatory approaches, such as metals criteria expressed as dissolved rather than total recoverable concentrations, and the revised human health criterion for mercury. In addition, in light of the issues surrounding the human health criteria for arsenic we support EPA's decision not to promulgate human health criteria at this time. With respect to implementation issues discussed in the Preamble, we support EPA's policies and guidance regarding the application of mixing zones and dilution credits. the use of interim permit limits while Total Maximum Daily Loads (TMDLs) and other special studies are being performed, and EPA's guidance to Regional Water Quality Control Boards (RWQCBs) that they may use any of the methods described in EPA's guidance document on the use of translators. We also support EPA's proposal to create a rebuttable presumption for Water Effects Ratios (WERs), allowing the RWQCBs and SWRCB to develop site-specific WERs that can be approved by EPA during the NPDES permit approval process. We believe that this approach will help facilitate the development of appropriate site-specific adjustments for metals criteria.

Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at.pg. 4 (emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself does not mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Alternative Mixing Zones

One of the few avenues that may actually provide some regulatory relief is mixing zones. The Preamble to the CTR describes a mixing zone as a limited area or volume of water where initial dilution of a discharge takes place and where water quality standards can be exceeded. Mixing zones have been applied in the water quality standards program since its inception. The present water quality standards regulations allows states to adopt acute and chronic mixing zones as a matter of state discretion, so long as the state's mixing zone protects the designated uses. See 40 C.F.R. section 131.13.

The Preamble recognizes that several California Regional Water Quality Control Boards have adopted mixing zone provisions in their respective Basin Plans. These mixing zone provisions can be applied to discharges to water bodies to which water quality standards based on the criteria contained in this proposed rule will apply once this rule becomes final. See CTR Preamble at pg. 42185. The problem

arises for the proposal or adoption of new mixing zones where one is not currently authorized under an existing Basin Plan. The Preamble sets out numerous restrictions on the use of mixing zones, as follows:

A mixing zone should be established to ensure that the zone will not impair the integrity of the water body as a whole, the zone will not cause lethality to passing organisms, and, considering likely pathways of exposure, that there are no significant human health risks. For application of two-number aquatic life crime as proposed in this rule, there may be up to two types of mixing zones. In the zone immediately surrounding the outfall, neither the acute nor the chronic criterion is met. The acute criterion is met at the edge of this zone. In the next mixing zone, the acute, but not the chronic, criterion is met. The chronic criterion is met at the edge of the second mixing zone. However, since both aquatic life and human health criteria are proposed in today's rule, the State may establish independent mixing zone policies for each. For any particular pollutant from any particular discharge, the magnitude, frequency, duration and mixing zone associated with each of the type of criteria may determine which one most limits the allowable discharge. Id.

The other potential problem arises because state-adopted mixing zones are subject to EPA review and approval, See 40 C.F.R. section 131.13. Because EPA approval is required, the question arises whether a federal rulemaking would accompany approval of mixing zones as it does with approval of state variances (which are also authorized under 40 C.F.R. section 131.13). If so, this would greatly restrict the utility of new or alternative mixing zones as an avenue for regulatory relief.

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.
(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself doesnot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Alternative Mixing Zones

One of the few avenues that may actually provide some regulatory relief is mixing zones. The Preamble to the CTR describes a mixing zone as a limited area or volume of water where initial dilution of a discharge takes place and where water quality standards can be exceeded. Mixing zones have been applied in the water quality standards program since its inception. The present water quality standards regulations allows states to adopt acute and chronic mixing zones as a matter of state discretion, so long as the state's mixing zone protects the designated uses, See 40 C.F.R. section 131.13.

The Preamble recognizes that several California Regional Water Quality Control Boards have adopted mixing zone provisions in their respective Basin Plans. These mixing zone provisions can be applied to discharges to water bodies to which water quality standards based on the criteria contained in this proposed rule will apply once this rule becomes final. See CTR Preamble at pg. 42185. The problem arises for the proposal or adoption of new mixing zones where one is not currently authorized under an existing Basin Plan. The Preamble sets out numerous restrictions on the use of mixing zones, as follows:

A mixing zone should be established to ensure that the zone will not impair the integrity of the water

body as a whole, the zone will not cause lethality to passing organisms, and, considering likely pathways of exposure, that there are no significant human health risks. For application of two-number aquatic life crime as proposed in this rule, there may be up to two types of mixing zones. In the zone immediately surrounding the outfall, neither the acute nor the chronic criterion is met. The acute criterion is met at the edge of this zone. In the next mixing zone, the acute, but not the chronic, criterion is met. The chronic criterion is met at the edge of the second mixing zone. However, since both aquatic life and human health criteria are proposed in today's rule, the State may establish independent mixing zone policies for each. For any particular pollutant from any particular discharge, the magnitude, frequency, duration and mixing zone associated with each of the type of criteria may determine which one most limits the allowable discharge. Id.

The other potential problem arises because state-adopted mixing zones are subject to EPA review and approval, See 40 C.F.R. section 131,13. Because EPA approval is required, the question arises whether a federal rulemaking would accompany approval of mixing zones as it does with approval of state variances (which are also authorized under 40-C.F.R. section 131.13). If so, this would greatly restrict the utility of new or alternative mixing zones as an avenue for regulatory relief.

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

Comment: We have reviewed the proposed CTR and offer the following comments:

2. The following provisions of the rule are supported:

(1) adoption of metals criteria as dissolved concentrations;

(2) expression of the metals criteria as a function of the water-effect ratio;

(3) adoption of the proposed new human health criteria for mercury; and

(4) the Preamble discussions regarding metals translators, mixing zones, and interim permit limits.

Were the old human health criterion for mercury (0.012 ug/ l) to be adopted, the City would have to remove its discharge from Tule Canal and go to land disposal. The capital cost to do this would be $22.1 million and the total present worth cost would be $23.1 million (see Exhibit B, Required Capital improvements and Costs for Beryllium and Mercury). This would translate to an annual cost of $3.1 million per year (at 7% over 10 years) and would require that monthly sewer service charges be increased by more than 100%.

Response to: CTR-044-003e

See response to CTR-004-009.

With respect to the comment about the economic impact of the old criterion for mercury 0.012 ug/l, EPA has not evaluated these costs since the CTR does not promulgate a mercury criteria of 0.012 ug/l.

Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at.pg. 4(emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself doesnot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Alternative Mixing Zones

One of the few avenues that may actually provide some regulatory relief is mixing zones. The Preamble to the CTR describes a mixing zone as a limited area or volume of water where initial dilution of a discharge takes place and where water quality standards can be exceeded. Mixing zones have been applied in the water quality standards program since its inception. The present water quality standards regulations allows states to adopt acute and chronic mixing zones as a matter of state discretion, so long as the state's mixing zone protects the designated uses, See 40 C.F.R. section 131.13.

The Preamble recognizes that several California Regional Water Quality Control Boards have adopted mixing zone provisions in their respective Basin Plans. These mixing zone provisions can be applied to discharges to water bodies to which water quality standards based on the criteria contained in this proposed rule will apply once this rule becomes final. See CTR Preamble at pg. 42185. The problem arises for the proposal or adoption of new mixing zones where one is not currently authorized under an existing Basin Plan. The Preamble sets out numerous restrictions on the use of mixing zones, as follows:

A mixing zone should be established to ensure that the zone will not impair the integrity of the water body as a whole, the zone will not cause lethality to passing organisms, and, considering likely pathways of exposure, that there are no significant human health risks. For application of two-number aquatic life crime as proposed in this rule, there may be up to two types of mixing zones. In the zone immediately surrounding the outfall, neither the acute nor the chronic criterion is met. The acute criterion is met at the edge of this zone. In the next mixing zone, the acute, but not the chronic, criterion is met. The chronic criterion is met at the edge of the second mixing zone. However, since both aquatic life and human health criteria are proposed in today's rule, the State may establish independent mixing zone policies for each. For any particular pollutant from any particular discharge, the magnitude, frequency, duration and mixing zone associated with each of the type of criteria may determine which one most limits the allowable discharge. Comment: C. RECOMMENDATIONS FOR MODIFICATIONS TO THE CTR AND EA

EPA should mandate that the State Board continue to use defensible dilution credits. Only if documented human health and/or aquatic toxicity problems are shown to exist in specific segments of water bodies should the State and Regional Boards be allowed to consider modifications to continued use of dilution credits.

Response to: CTR-052-019

EPA does not believe that it is appropriate to mandate that the State use dilution credits or mixing zones because these decisions are most appropriately addressed at the State and local level. The State has discretion to make modifications to its mixing zone policy based on any scientific or policy grounds as long as the modifications are consistent with State and Federal law. The State is not required to limit modifications to its mixing zone policy only to those cases where human health or toxicity problems are shown to exist in specific segments of water bodies. States may always be more stringent than EPA in adopting water quality standards. See section 510 of the Clean Water Act.

Comment: BADA supports the Preamble discussions regarding metals translators, mixing zones, and interim permit limits. Translators and mixing zones will provide a better scientific basis for the application of the criteria and will go a long way toward protecting against the imposition of unnecessary or unreasonable controls. Interim permit limits will allow dischargers faced with potential attainability problems to pursue reasonable actions, such as pollution prevention, treatment plant optimization, pollutant trading, TMDLS, etc. prior to being faced with final effluent limitations. BADA endorses the recommendation of the State Plan Public Task Forces on the issue of interim limits.

Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at.pg. 4(emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself doesnot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Alternative Mixing Zones

One of the few avenues that may actually provide some regulatory relief is mixing zones. The Preamble to the CTR describes a mixing zone as a limited area or volume of water where initial dilution of a

discharge takes place and where water quality standards can be exceeded. Mixing zones have been applied in the water quality standards program since its inception. The present water quality standards regulations allows states to adopt acute and chronic mixing zones as a matter of state discretion, so long as the state's mixing zone protects the designated uses, See 40 C.F.R. section 131.13.

The Preamble recognizes that several California Regional Water Quality Control Boards have adopted mixing zone provisions in their respective Basin Plans. These mixing zone provisions can be applied to discharges to water bodies to which water quality standards based on the criteria contained in this proposed rule will apply once this rule becomes final. See CTR Preamble at pg. 42185. The problem arises for the proposal or adoption of new mixing zones where one is not currently authorized under an existing Basin Plan. The Preamble sets out numerous restrictions on the use of mixing zones, as follows:

A mixing zone should be established to ensure that the zone will not impair the integrity of the water body as a whole, the zone will not cause lethality to passing organisms, and, considering likely pathways of exposure, that there are no significant human health risks. For application of two-number aquatic life crime as proposed in this rule, there may be up to two types of mixing zones. In the zone immediately surrounding the outfall, neither the acute nor the chronic criterion is met. The acute criterion is met at the edge of this zone. In the next mixing zone, the acute, but not the chronic, criterion is met. The chronic criterion is met at the edge of the second mixing zone. However, since both aquatic life and human health criteria are proposed in today's rule, the State may establish independent mixing zone policies for each. For any particular pollutant from any particular discharge, the magnitude, frequency, duration and mixing zone associated with each of the type of criteria may determine which one most limits the allowable discharge. Id.

The other potential problem arises because state-adopted mixing zones are subject to EPA review and approval, See 40 C.F.R. section 131,13. Because EPA approval is required, the question arises whether a federal rulemaking would accompany approval of mixing zones as it does with approval of state variances (which are also authorized under 40-C.F.R. section 131.13). If so, this would greatly restrict the utility of new or alternative mixing zones as an avenue for regulatory relief.

Comment: 7. Mixing Zones. WSPA supports EPA's recognition of the use of mixing zones.

In proposing the rule, EPA has recognized the appropriate role of mixing zones in setting and achieving WQBELS. EPA regulations, policy and guidance (e.g., the Technical Support Document for WQBELS) amply support their use in protecting receiving water.

WPSA supports the use of sound science in determining mixing zones and the actual degree of mixing achieved by today's engineered diffusers in establishing mixing zones and dilution credit. EPA should encourage states and regulators to make use of sound science, rather than arbitrary dilution factors, in establishing mixing zones. To this end WSPA supports additional EPA outreach to the states and state regulators to achieve a comfort level with using sound science and avoiding arbitrary decisions.

Comment: The draft California Toxics Rule (CTR) is clearly the product of substantial effort by USEPA staff, and we applaud this effort and its intent. On several issues of concern to public utilities, the CTR strikes a good balance between the need to promulgate standards and the need to base those standards on sound science. Examples include the use of dissolved concentrations rather than the total recoverable concentrations for metals, the deferral of human health criteria for arsenic until adequate information is available, and the revision of the human health criterion for mercury. We are also pleased with the CTR's guidance and flexibility, on mixing zones and dilution credits, total maximum daily loads (TMDLs), compliance schedules, and translators.

Comment: There are many features of the proposed rule which we strongly endorse, specifically:

* the use of the latest IRIS values for human health criteria, it is essential that the criteria be based on the latest scientific and environmental information;

* recognition that the dissolved fraction of metals, rather than the total recoverable, better reflect the aquatic toxicity of metals;

* recognition that for certain metals (e.g. copper and zinc) ambient water chemistry is critical in determining toxicity thereby endorsing the Water Effects Ratio;

* recognition and strong endorsement of the multi-tiered mixing zones for acute, chronic and human health effects; and

* recognition of interim limits and compliance schedules as appropriate implementation strategies,

Comment: Mixing Zones

The City fully supports the discussion and allowance of mixing zones for both acute and chronic criteria in accordance with EPA's water quality standards program. The establishment of mixing zones should be allowed in those instances where designated uses remain unimpaired, where the zone does not result in lethal doses to resident organisms, and where human health aspects are adequately protected.

Comment: There are good things in here regarding the variances and the recognition of the existence of ephemeral streams. And the naturally occurring pollution, you know, has to be taken into account when it actually applies to water quality standards.

I would observe in that regard that the NPDES program recognizes that intake credits may sometimes be appropriately applied to adjust effluent limits. But in the NPDES language it states that that only can occur when you discharge into the same water body that you take the water from.

In our case, of course, we use groundwater. And, as an example, it may contain arsenic. And the arsenic isn't really removed from the water before it is discharged to surface water. We don't fit the mold of being authorized those intake credits, because we're not discharging into the same water body that we draw water from.

Response to: CTRH-001-022b

EPA recognizes that a same body of water demonstration may be more difficult for a municipality using groundwater; however, groundwater as a category is not excluded necessarily from eligibility for a same body of water determination. EPA's rationale for intake credits is based on two guiding principles: 1) the source water and receiving water are hydrologically connected; and, 2) that the pollutant would have ended up in the receiving water had the man-induced removal and reintroduction of the pollutant not occurred. If a same body of water determination cannot be made, there are other more appropriate forms of flexibility for inter-water body transfers of pollutants where the discharger is unable to comply with its new or more stringent water quality-based effluent limit, e.g., variances, compliance schedules.

Comment: MS. PLA: My name is Michelle Pla. I'm with the Public Utilities Commission, City and County of San Francisco.

I made the comment on my card that I also said that I would try to be constructive, and so I'm going to follow my mentor here, Phil Bobel, and say that there are some things in this rule that we're very pleased to see.

We're very pleased to see use of the latest scientific information, particularly the use of latest IRIS, I-R-I-S, numbers-for human health. We're very pleased that you're using dissolved versus total recoverable form for the metals.

We're very pleased to see recognition of the water effects ratios. We're pleased to see recognition for a multi-tiered mixing zone for acute and chronic human health effects and hope that the state pays particular attention to that.

We do have a problem with the way you've described compliance schedules and hope to be working strictly by the state on that as well. We think that the five-year system is fairly shortsighted, and -we can't even do FMDSLs in five years.

Comment: I would like to take this time to note that I think it contains some importantelements that we agree with and believe are reflective of the impact. These include the uses of dissolved metals and the provisions which will enable the state to use mixing zones and water effects ratios and establish site-specific objectives.

Comment: Some of the flexibility that the City highly supports is the water effect ratio investigations to adjust statewide criteria to site-specific conditions; the interim limits concept while special studies are being conducted by the dischargers and other entities; a variance procedure to allow dischargers to achieve progress toward effluent limit attainment without violating applicable water quality standards; dissolved criteria for metals to reflect the toxicological conditions; translators to adjust dissolved criteria to total permit limitations; trading programs to attain and maintain water quality; and a mixing zone that reflects true instream pollutant conditions and that protects beneficial uses.

Comment: National Water Quality Inventory

At the September 17,1997 hearing on the proposed CTR, the US EPA Region 9 made available on the table in the hearing room a copy of the US EPA Fact Sheet "National Water Quality Inventory: 1994 Report to Congress" (1995) evidently to try to convince the hearing participants that the adoption of the proposed CTR criteria was necessary to protect the Nation's waters from the impact of toxics that are regulated by the proposed CTR. Shortly after the release of that report to Congress, I conducted a review of the procedures used by the US EPA and the states in determining the presence of so-called "impaired" waters and found that the Agency had again used unreliable procedures for designating impaired waters. Enclosed is a copy of a report, "Unreliable Reporting of Water Quality Impairment by the US EPA's National Water Quality Inventory," Feb (1996) that I have prepared on this issue. The Agency dictates to the states that they must list as impaired any waterbody for which there is an exceedance of a water quality criterion more than once in three years. The Agency ignores the well-known fact that many of the exceedances are administrative, arising from the overly protective nature of the criteria that results from the failure of the criteria and the water effects ratio approach to properly incorporate the aquatic chemistry of the regulated constituents into assessing potential toxicity to aquatic life. The actual amount of real use-impaired waters of concern to the public is far less than that predicted by the US EPA "Fact Sheet."

Response to: CTR-061-020

First, EPA notes that the National Water Quality Inventory Reports (also referred to as the CWA Section 305(b) report) and the guidance used by States and Indian Tribes for developing these reports are outside of the scope of today's rule. The Agency will, however, take the commenter's concerns under advisement and consider those concerns expressed in the review of the Section 305(b) guidance for preparing the reports which EPA jointly develops with States and Indian Tribes.

Comment: Available Regulatory Relief under the California Toxics Rule

The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at. pg. 4 (emphasis added). Based on this assumption, no treatment cost was estimated for the facility. (*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself does riot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Water Quality Standard Variances/ Designated Use Modifications

The Preamble to the CTR discusses variances as a form of regulatory relief that might be pursued by dischargers. See 62 Fed.Rec,. 42,185-6. The Preamble provides that States may adopt a statewide policy (or Regional Boards may adopt Basin-wide policies) to allow water quality standard variances for individual dischargers. The variance Policy Would allow the State or Regional Board to grant a variance to an individual permittee from a water quality standard,(*5) which is the basis of a water quality-based effluent limitation in a permit. However, there are some serious restrictions placed oil tile use of variances. The following lays out these restrictions:

* Variances are not allowed for new or recommencing dischargers.

* Variances are discharger and pollutant specific. In other words, the water quality standard variance applies only to the permittee requested the variance and only to the pollutant or pollutants specified in the variance.

* Once a variance has been approved by the State, it must be submitted to EPA for approval. - EPA will only approve variances if consistent with the substantive requirements set out at 40 CFR Part 131 for

removing a designated use.(*6)

* EPA will only approve state variances if specific provisions are included.(*7)

* EPA would have to tinder-take a federal rulemaking to make the necessary changes to this rule to allow for State-approved variances. The Preamble explains this restriction as follows:

EPA, however, cautious California and the public that promulgation of this federal rule removes most of the flexibility available to the State for modifying its standards on a discharger-specific or stream-specific basis. For example, variances and site-specific criteria development are actions sometimes adopted by states. These are optional policies under terms of the federal water quality standards regulation. Except for tire water-effect ratio procedure for certain metals, EPA has not incorporated either optional policy, in general, in this proposed rulemaking, that is, EPA has not generally authorized State modifications of federal water quality. Each of these types of modifications will, in general, require federal rulemaking on a case by case basis to change the federal rule. Because of the time consuming nature of reviewing such requests, limited federal resources, and the need for the Agency to move into other priority program areas in establishing environmental controls, EPA alerts California and the public that a prompt Agency response is unlikely. The best course of action, if such provisions are desired, is for the State to adopt its own standards and take advantage, if it so chooses, of the flexibility offered by these optional provisions.(*8)

Because of all of the restrictions placed on their use, variances are not really a viable option for regulatory relief. The only way for variances to be a viable option would be for EPA to incorporate a variance policy into the proposed rule that would authorize State modifications of federal water quality standards.

(*1) This cost trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario, See EA at pg. 4.

(*2) In addition, pollutant load I reductions word not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*4) EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 20 (April 1991) (Emphasis added).

(*5) The variance would allow the permittee time to achieve reasonable progress towards attaining a specific water quality based effluent limitation, without violating CWA section 402(a)(1), which requires that NPDES permittees meet all applicable water quality standards. See 62 Fed.Reg, 42185-6. A variance does not effect the corresponding water quality standard fur the water body receiving the discharge. Variances are designed to preserve the underlying water quality standard over the long term, while providing flexibility to individual dischargers in complying with peanut limits based on the standards. When a variance is granted, the discharger is assured compliance during the term of a variance, as long as all variance conditions are met. Id.

(*6) Specifically, the State's policy must require the inclusion of a demonstration that a water quality standard is unattainable, based on one or more of the following grounds: 1. Naturally occurring pollutant concentrations prevent the attainment of the water quality standard; 2. Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the water quality standard, unless these

conditions may be compensated for by the discharge of sufficient volume of effluent to enable the standard to be met without violating State water conservation requirements; 3. Human-caused conditions or sources of pollution prevent the attainment of the water quality standard and cannot be remedied, or would cause more environmental damage to correct than to leave in place; 4. Dams, diversions or other types of hydrologic modifications preclude the attainment of a water quality standard, and it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the standard; 5. Physical conditions related to the natural features of the water body, such as the lack of a proper substrate cover, flow, depth, pools, riffles, and the like, unrelated to chemical water quality, preclude attainment of the water quality standard; or 6. Controls more stringent than those required by CWA sections 30 1 (b) and 306 would result in substantial and widespread economic and social impact.

(*7) The required provisions are as follows: 1. The State will include each individual variance as part of its water quality standard or water quality plan; 2. The variance will include documentation that treatment more advanced than that required by CWA section 301(b) and 306 has been carefully considered, and that alternative effluent control strategies have been evaluated; 3. The underlying, more stringent criterion will be maintained and will be binding on all other dischargers; 4. The discharger who will be given a variance for one particular constituent will be required to meet the applicable criteria for other constituents; 5. The variance will be granted for a specific period of time and must be rejustified upon expiration, but at least every three years; 6. Reasonable progress will be made towards meeting the underlying standards; 7. The variance will not likely jeopardize the continued existence of any threatened or endangered species listed under Section 4 of the Endangered Species Act or result in the destruction or adverse modification of such species' critical habitat; and 8. The variance will be subjected to public notice, comment, and hearing. See CWA section 303(c)(t) and 40 CFR 131.20. The public notice should contain a clear description of the impact of the variances upon achieving the water quality standard in the water body.

(*8) See CTR Preamble at pg. 42195-6. Further guidance on variance policies is provided in EPA's 1994 Water Quality Standards Handbook, Chapters 2 and 5 (EPA 823-B-94-005a, August 1994).

Response to: CTR-004-007

EPA disagrees that variances are not a viable option for regulatory relief for dischargers. The ability of States to develop site specific criteria or to grant variances and exceptions to water quality standards are optional procedures that are available to States (See 40 CFR 131.11(b)(ii) and 131.3). It is neither a statutory nor a regulatory requirement to develop site specific criteria or to issue variances.

Since the criteria in this rule are Federal criteria that are applicable in the State, the State cannot unilaterally establish site-specific criteria or issue variances to the Federal rule. Such provisions are still available to the State, but are more cumbersome as it requires the State to meet all the regulatory requirements for developing such procedures, but then EPA would need to undertake a Federal rulemaking process on a case by case basis in order to effectuate changes to the rule in accordance with the Administrative Procedures Act. EPA emphasizes that this is a strong reason for California to act to adopt its own numeric criteria even after this Federal promulgation action is taken.

The basis for assuming that regulatory relief would be available under certain circumstances for purposes of estimating costs is explained in the economic analysis for this rule. Note that EPA's high end cost estimate assumed that no regulatory relief would be available to dischargers.

Comment: Variances (FR p. 42185, Preamble section F.3.)

The Agency describes the procedures and demonstrations that any state-adopted variance policy must contain, and also states that the Agency must approve the policy. Additionally, should any variance from a water quality criterion subsequently result from the state policy, it is indicated that a federal rulemaking must occur to recognize each variance from the Rule. Is this true? Agency "approval" is required, according to the Agency's Water Quality Standards Handbook (1994). If the Agency approves a state variance policy, then actions under the policy should follow the policy procedures, whether the criteria are federal or state. The last part of these statements essentially denies modifications to the water quality criteria. The Agency is effectively removing the flexibility which seems to be under the purview of the state.

Comment: pp. 42185-42186 -- Variances The Preamble encourages the SWRCB to adopt a policy allowing dischargers to apply for variances, but stops short of adopting a provision in the CTR allowing variances. EPA further states that the granting of variances will require a federal rulemaking on a case-by-case basis, and that "a prompt Agency response is unlikely." As with site-specific criteria, we object, on the one hand, to EPA's assumption in the cost analysis that regulatory relief mechanisms such as variances will not only be available but will be granted to dischargers, while on the other hand EPA essentially states that it does not intend to grant variances. We believe these approaches conflict, and that EPA must resolve these inconsistencies before finalizing the CTR- Therefore, we strongly urge EPA

to include a provision in the CTR authorizing the issuance of variances. However, we recommend that EPA provide flexibility in variance procedures to allow for such things as variances without federal rulemaking requirements, and consideration of multiple discharger (or water body) variances, consistent with the policy of fostering collaborative, watershed-based solutions to water quality problems.

Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Water Quality Standard Variances/ Designated Use Modifications

The Preamble to the CTR discusses variances as a form of regulatory relief that might be pursued by dischargers. See 62 Fed. Reg. 42,185-6. The Preamble provides that States may adopt a statewide policy (or Regional Boards may adopt Basin-wide policies) to allow water quality standard variances for individual dischargers. The variance policy would allow the State or Regional Board to grant a variance to an individual permittee from a water quality standard,(*5) which is the basis of a water quality-based effluent limitation in a permit. However, there are some serious restrictions placed on the use of variances. The following lays out these restrictions:

* Variances are not allowed for new or recommencing dischargers. * Variances are discharger and pollutant specific. In other words, the

water quality standard variance applies only to the permittee requesting the variance and only to the pollutant or pollutants specified in the variance. * Once a variance has been approved by the State, it must be submitted to EPA for approval. - EPA will only approve variances if consistent with the substantive requirements set out at 40 CFR Part 131 for removing a designated use.(*6) - EPA will only approve state variances if specific provisions are included.(*7) - EPA would have to undertake a federal rulemaking to make the necessary changes to this rule to allow for State-approved variances, The Preamble explains this restriction as follows:

EPA, however, cautions California and the public that promulgation of this federal rule removes most of the flexibility available to the State for modifying it standards on a discharger-specific or stream-specific basis. For example, variances and site-specific criteria development are actions sometimes adopted by states. These are optional policies under terms of the federal water quality standards regulation. Except for the water-effect ratio procedure for certain metals, EPA has not incorporated either optional policy, in general, in this proposed rulemaking, that is, EPA has not generally authorized State modifications of federal water quality standards. Each of these types of modifications will, in general, require federal rulemaking on a case by case basis to change the federal rule. Because of the time consuming nature of reviewing such requests, limited federal resources, and the need for the Agency to move into other priority program areas in establishing environmental controls, EPA alerts California and the public that a prompt Agency response is unlikely. The best course of action, if such provisions are desired, is for the State to adopt its own standards and take advantage, if it so chooses, of the flexibility offered by these optional provisions. (*8)

Because of all of the restrictions placed on their use, variances are not really a viable option for regulatory relief. The only way for variances to be a viable option would be for EPA to incorporate a variance policy into the proposed rule that would authorize State modifications of federal water quality standards.

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*5) The variance would allow the permittee to achieve reasonable progress towards attaining a specific water quality-based effluent limitation, without violating CWA section 402(a)(1), which requires that NPDES permittees meet all applicable water quality standards, See 62 Fed.Reg. 42185-6. A variance does not effect the corresponding water quality for the water body receiving the discharge. Variances are designed to preserve the underlying water quality standard over the long term, while providing flexibility to individual dischargers in complying with permit limits based on the standards. When a variance is granted, the discharger is assured compliance during the term of a variance, as long as all variance conditions are met. Id.

(*6) Specifically, the State's policy must require the inclusion of a demonstration that a water quality standard is unattainable, based on one or more of the following grounds:

1. Naturally occurring pollutant concentrations prevent the attainment of the water quality standard; 2.

Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the water quality standard, unless these conditions may be compensated for by the discharge of sufficient volume of effluent to enable the standard to be met without violating State water conservation requirements; 3. Human-caused conditions or sources of pollution prevent the attainment of the water quality standard and cannot be remedied, or would cause more environmental damage to correct than to leave in place; 4. Dams, diversions or other types of hydrologic modifications preclude the attainment of a water quality standard, and it is not feasable to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the standard; 5. Physical conditions related to the natural features of the water body, such as the lack of a proper substrate cover, flow, depth, pools, riffles, and the like, unrelated to chemical water quality, preclude attainment of the water quality standard; or 6. Controls more stringent than those required by CWA sections 301(b) and 306 would result in substantial and widespread economic and social impact.

(*7) The required provisions are as follows: 1. The State will include each individual variance as part of its water quality standard or water quality plan; 2. The variance will include documentation that treatment more advanced than that required by CWA section 301(b) and 306 has been carefully considered, and that alternative effluent control strategies have been evaluated; 3. The underlying, more stringent criterion will be maintained and will be binding on all other discharges; 4. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself doesnot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Water Quality Standard Variances/ Designated Use Modifications

The Preamble to the CTR discusses variances as a form of regulatory relief that might be pursued by dischargers. See 62 Fed.Reg. 42,185-6. The Preamble provides that States may adopt a statewide policy (or Regional Boards may adopt Basin-wide policies) to allow water quality standard variances for individual dischargers. The variance policy would allow the State or Regional Board to grant a variance to an individual permittee from a water quality standard,(*5) which is the basis of a water quality-based effluent limitation in a permit. However, there are some serious restrictions placed on the use of variances. The following lays out these restrictions:

* Variances are not allowed for new or recommending dischargers.

* Variances are discharger and pollutant specific. In other words, the water quality standard variance applies only to the permittee requesting the variance and only to the pollutant or pollutants specified in the variance.

* Once a variance has been approved by the State, it must be submitted to EPA for approval.

- EPA will only approve variances if consistent with the substantive requirements set out at 40 CFR Part 131 for removing a designated use.(*6)

- EPA will only approve state variances if specific provisions are included.(*7) - EPA would have to undertake a federal rulemaking to make the necessary changes to this rule to allow for State-approved variances. The Preamble explains this restriction as follows:

EPA, however, cautions California and the public that promulgation of this federal rule, removes most of the flexibility available to the State for modifying its standards on a discharger-specific or stream-specific basis. For example, variances and site-specific criteria development are actions sometimes adopted by states. These are optional policies under terms of the federal water quality standards regulation. Except for the water-effect ratio procedure for certain metals, EPA has not incorporated either optional policy, in general, in this proposed rulemaking, that is, EPA has not generally authorized State modifications of federal water quality standards. Each of these types of modifications will, in general, require federal rulemaking on a case by case basis to change the federal rule. Because of the time consuming nature of reviewing such requests, limited federal resources, and the need for the Agency to move into other priority program areas in establishing environmental controls, EPA alerts California and the public that a prompt Agency response is unlikely. The best course of

action, if such provisions are desired, is for the State to adopt its own standards and take advantage, if it so chooses, of the flexibility offered by these optional provisions. (*8)

Because of all of the restrictions placed on their use, variances are not really a viable option for regulatory relief. The only way for variances to be a viable option would be for EPA to incorporate a variance policy into the proposed rule that would authorize State modifications of federal water quality standards.

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*4) EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 20 (April 1991) (emphasis added).

(*5) The variance would allow the permittee to achieve reasonable progress towards attaining a specific water quality-based effluent limitation, without violating CWA section 402(a)(1), which requires that NPDES permittees meet all applicable water quality standards, See 62 Fed.Reg. 42185-6. A variance does not effect the corresponding water quality for the water body receiving the discharge. Variances are designed to preserve the underlying water quality standard over the long term, while providing flexibility to individual dischargers in complying with permit limits based on the standards. When a variance is granted, the discharger is assured compliance during the term of a variance, as long as all variance conditions are met. Id.

(*6) Specifically, the State's policy must require the inclusion of a demonstration that a water quality standard is unattainable, based on one or more of the following grounds:

1. Normally occurring pollutant concentrations prevent the attainment of the water quality standard; 2. Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the water quality standard, unless these conditions may be compensated for by the discharge of sufficient volume of effluent to enable the standard to be met without violating State water conservation requirements; 3. Human-caused conditions or sources of pollution prevent the attainment of the water quality standard and cannot be remedied, or would cause more environmental damage to correct than to leave in place; 4. Dams, diversions or other types of hydrologic modifications preclude the attainment of a water quality standard, and it is not feasable to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the standard; 5. Physical conditions related to the natural features of the water body, such as the lack of a proper substrate cover, flow, depth, pools, riffles, and the like, unrelated to chemical water quality, preclude attainment of the water quality standard; or 6. Controls more stringent than those required by CWA sections 301(b) and 306 would result in substantial and widespread economic and social impact.

(*7) The required provisions are as follows: 1. The State will include each individual variance as part of its water quality standard or water quality plan; 2. The variance will include documentation that treatment more advanced than that required by CWA section 301(b) and 306 has been carefully considered, and that alternative effluent control strategies have been evaluated; 3. The underlying, more stringent criterion will be maintained and will be binding on all other discharges; 4. The

discharger who will be given a variance for one particular constituent will be required to meet the applicable criteria for other constituents; 5. The variance will be granted for a secific period of time and must be rejustified upon expiration, but at least every three years; 6. Reasonable progress will be made towards meeting the underlying standards; 7. The variance will not likely jeopardize the continued existence of any threatened or endangered species listed under Section 4 of the Endangered Species Act or result in the destruction or adverse modification of such species' critical habitat; and 8. The variance will be subjected to public notice, comment and hearing. See CWA section 303(c)(1) and 40 CFR 131.20. The public notice should contain a clear description of the impact of the variance upon achieving the water quality standard in the water body.

(*8) See CTR Preamble at pg. 42185-6. Further guidance on variance policies is provided in EPAs 1994 Water Quality Standards Handbook, Chapters 2 and 5 (EPA 823-B-94-005a, August 1994).

Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at.pg. 4(emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself doesnot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Water Quality Standard Variances/ Designated Use Modifications

The Preamble to the CTR discusses variances as a form of regulatory relief that might be pursued by dischargers. See 62 Fed.Reg. 42,185-6. The Preamble provides that States may adopt a statewide policy

(or Regional Boards may adopt Basin-wide policies) to allow water quality standard variances for individual dischargers. The variance policy would allow the State or Regional Board to grant a variance to an individual permittee from a water quality standard,(*5) which is the basis of a water quality-based effluent limitation in a permit. However, there are some serious restrictions placed on the use of variances. The following lays out these restrictions:

* Variances are not allowed for new or recommending dischargers.

* Variances are discharger and pollutant specific. In other words, the water quality standard variance applies only to the permittee requesting the variance and only to the pollutant or pollutants specified in the variance.

* Once a variance has been approved by the State, it must be submitted to EPA for approval.

- EPA will only approve variances if consistent with the substantive requirements set out at 40 CFR Part 131 for removing a designated use.(*6)

- EPA will only approve state variances if specific provisions are included.(*7) - EPA would have to undertake a federal rulemaking to make the necessary changes to this rule to allow for State-approved variances. The Preamble explains this restriction as follows:

EPA, however, cautions California and the public that promulgation of this federal rule, removes most of the flexibility available to the State for modifying its standards on a discharger-specific or stream-specific basis. For example, variances and site-specific criteria development are actions sometimes adopted by states. These are optional policies under terms of the federal water quality standards regulation. Except for the water-effect ratio procedure for certain metals, EPA has not incorporated either optional policy, in general, in this proposed rulemaking, that is, EPA has not generally authorized State modifications of federal water quality standards. Each of these types of modifications will, in general, require federal rulemaking on a case by case basis to change the federal rule. Because of the time consuming nature of reviewing such requests, limited federal resources, and the need for the Agency to move into other priority program areas in establishing environmental controls, EPA alerts California and the public that a prompt Agency response is unlikely. The best course of action, if such provisions are desired, is for the State to adopt its own standards and take advantage, if it so chooses, of the flexibility offered by these optional provisions. (*8)

Because of all of the restrictions placed on their use, variances are not really a viable option for regulatory relief. The only way for variances to be a viable option would be for EPA to incorporate a variance policy into the proposed rule that would authorize State modifications of federal water quality standards.

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*4) EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 20 (April 1991) (emphasis added).

(*5) The variance would allow the permittee to achieve reasonable progress towards attaining a specific water quality-based effluent limitation, without violating CWA section 402(a)(1), which requires that NPDES permittees meet all applicable water quality standards, See 62 Fed.Reg. 42185-6. A variance does not effect the corresponding water quality for the water body receiving the discharge. Variances are designed to preserve the underlying water quality standard over the long term, while providing flexibility to individual dischargers in complying with permit limits based on the standards. When a variance is granted, the discharger is assured compliance during the term of a variance, as long as all variance conditions are met. Id.

(*6) Specifically, the State's policy must require the inclusion of a demonstration that a water quality standard is unattainable, based on one or more of the following grounds:

1. Normally occurring pollutant concentrations prevent the attainment of the water quality standard; 2. Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the water quality standard, unless these conditions may be compensated for by the discharge of sufficient volume of effluent to enable the standard to be met without violating State water conservation requirements; 3. Human-caused conditions or sources of pollution prevent the attainment of the water quality standard and cannot be remedied, or would cause more environmental damage to correct than to leave in place; 4. Dams, diversions or other types of hydrologic modifications preclude the attainment of a water quality standard, and it is not feasable to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the standard; 5. Physical conditions related to the natural features of the water body, such as the lack of a proper substrate cover, flow, depth, pools, riffles, and the like, unrelated to chemical water quality, preclude attainment of the water quality standard; or 6. Controls more stringent than those required by CWA sections 301(b) and 306 would result in substantial and widespread economic and social impact.

(*7) The required provisions are as follows: 1. The State will include each individual variance as part of its water quality standard or water quality plan; 2. The variance will include documentation that treatment more advanced than that required by CWA section 301(b) and 306 has been carefully considered, and that alternative effluent control strategies have been evaluated; 3. The underlying, more stringent criterion will be maintained and will be binding on all other discharges; 4. The discharger who will be given a variance for one particular constituent will be required to meet the applicable criteria for other constituents; 5. The variance will be granted for a secific period of time and must be rejustified upon expiration, but at least every three years; 6. Reasonable progress will be made towards meeting the underlying standards; 7. The variance will not likely jeopardize the continued existence of any threatened or endangered species listed under Section 4 of the Endangered Species Act or result in the destruction or adverse modification of such species' critical habitat; and 8. The variance will be subjected to public notice, comment and hearing. See CWA section 303(c)(1) and 40 CFR 131.20. The public notice should contain a clear description of the impact of the variance upon achieving the water quality standard in the water body.

(*8) See CTR Preamble at pg. 42185-6. Further guidance on variance policies is provided in EPAs 1994 Water Quality Standards Handbook, Chapters 2 and 5 (EPA 823-B-94-005a, August 1994).

Comment: II. EPA Should Allow Variances and Site-Specific modifications.

Beyond the issue of whether EPA has the authority to issue the proposed rule, there are other significant problems with the proposal. For example, the Agency has made the inexplicable decision not to include provisions that would allow for issuance of variances or site-specific modifications to the criteria. This is despite the Agency's recognition that a variance procedure is an "important procedure to assist the State in effectively implementing water quality standards." (62 Fed. Reg. at 42185). EPA gives absolutely no explanation for its decision not to allow use of this procedure. Moreover, the Agency concedes that "promulgation of this federal rule removes most of the flexibility available to the State for modifying its standards on a discharger-specific or stream-specific basis. " Instead, an applicant would have to ask EPA to begin a "federal rulemaking on a case-by-case basis to change the federal rule." (62 Fed. Reg. at 42186) EPA makes it quite clear that applicants should not expect any relief from that avenue, because the Agency simply has more important things to do:

Because of the time consuming nature of reviewing such requests, limited federal resources, and the need for the Agency to move into other priority program areas in establishing environmental controls, EPA alerts California and the public that a prompt Agency response is unlikely.

Despite this cavalier dismissal of the need for actually acting on variance and site criteria applications, the Agency does not hesitate to mention those mechanisms in its economic analysis as being available to moderate the impact of the proposed rule. The Agency specifically mentions variances and site-specific criteria when it states that "these implementation procedures can have an effect on how water quality standards, based on today's proposed rule, will impact NPDES permit holders." (62 Fed. Reg. at 42192). In fact, that statement is clearly false, given EPA's decision not to include variance or site-specific criteria procedures in the proposed rule. The Agency should reconsider that decision and insert those provisions.

Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at.pg. 4(emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself doesnot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Water Quality Standard Variances/ Designated Use Modifications

The Preamble to the CTR discusses variances as a form of regulatory relief that might be pursued by dischargers. See 62 Fed.Reg. 42,185-6. The Preamble provides that States may adopt a statewide policy (or Regional Boards may adopt Basin-wide policies) to allow water quality standard variances for individual dischargers. The variance policy would allow the State or Regional Board to grant a variance to an individual permittee from a water quality standard,(*5) which is the basis of a water quality-based effluent limitation in a permit. However, there are some serious restrictions placed on the use of variances. The following lays out these restrictions:

* Variances are not allowed for new or recommending dischargers.

* Variances are discharger and pollutant specific. In other words, the water quality standard variance applies only to the permittee requesting the variance and only to the pollutant or pollutants specified in the variance.

* Once a variance has been approved by the State, it must be submitted to EPA for approval.

- EPA will only approve variances if consistent with the substantive requirements set out at 40 CFR Part 131 for removing a designated use.(*6)

- EPA will only approve state variances if specific provisions are included.(*7) - EPA would have to undertake a federal rulemaking to make the necessary changes to this rule to allow for State-approved variances. The Preamble explains this restriction as follows:

EPA, however, cautions California and the public that promulgation of this federal rule, removes most of the flexibility available to the State for modifying its standards on a discharger-specific or stream-specific basis. For example, variances and site-specific criteria development are actions

sometimes adopted by states. These are optional policies under terms of the federal water quality standards regulation. Except for the water-effect ratio procedure for certain metals, EPA has not incorporated either optional policy, in general, in this proposed rulemaking, that is, EPA has not generally authorized State modifications of federal water quality standards. Each of these types of modifications will, in general, require federal rulemaking on a case by case basis to change the federal rule. Because of the time consuming nature of reviewing such requests, limited federal resources, and the need for the Agency to move into other priority program areas in establishing environmental controls, EPA alerts California and the public that a prompt Agency response is unlikely. The best course of action, if such provisions are desired, is for the State to adopt its own standards and take advantage, if it so chooses, of the flexibility offered by these optional provisions. (*8)

Because of all of the restrictions placed on their use, variances are not really a viable option for regulatory relief. The only way for variances to be a viable option would be for EPA to incorporate a variance policy into the proposed rule that would authorize State modifications of federal water quality standards.

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*4) EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 20 (April 1991) (emphasis added).

(*5) The variance would allow the permittee to achieve reasonable progress towards attaining a specific water quality-based effluent limitation, without violating CWA section 402(a)(1), which requires that NPDES permittees meet all applicable water quality standards, See 62 Fed.Reg. 42185-6. A variance does not effect the corresponding water quality for the water body receiving the discharge. Variances are designed to preserve the underlying water quality standard over the long term, while providing flexibility to individual dischargers in complying with permit limits based on the standards. When a variance is granted, the discharger is assured compliance during the term of a variance, as long as all variance conditions are met. Id.

(*6) Specifically, the State's policy must require the inclusion of a demonstration that a water quality standard is unattainable, based on one or more of the following grounds:

1. Normally occurring pollutant concentrations prevent the attainment of the water quality standard; 2. Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the water quality standard, unless these conditions may be compensated for by the discharge of sufficient volume of effluent to enable the standard to be met without violating State water conservation requirements; 3. Human-caused conditions or sources of pollution prevent the attainment of the water quality standard and cannot be remedied, or would cause more environmental damage to correct than to leave in place; 4. Dams, diversions or other types of hydrologic modifications preclude the attainment of a water quality standard, and it is not feasable to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the standard; 5. Physical conditions related to the natural features of the water body, such as the lack of a proper substrate cover, flow, depth, pools, riffles, and the like, unrelated to chemical water quality, preclude attainment of the

water quality standard; or 6. Controls more stringent than those required by CWA sections 301(b) and 306 would result in substantial and widespread economic and social impact.

(*7) The required provisions are as follows: 1. The State will include each individual variance as part of its water quality standard or water quality plan; 2. The variance will include documentation that treatment more advanced than that required by CWA section 301(b) and 306 has been carefully considered, and that alternative effluent control strategies have been evaluated; 3. The underlying, more stringent criterion will be maintained and will be binding on all other discharges; 4. The discharger who will be given a variance for one particular constituent will be required to meet the applicable criteria for other constituents; 5. The variance will be granted for a secific period of time and must be rejustified upon expiration, but at least every three years; 6. Reasonable progress will be made towards meeting the underlying standards; 7. The variance will not likely jeopardize the continued existence of any threatened or endangered species listed under Section 4 of the Endangered Species Act or result in the destruction or adverse modification of such species' critical habitat; and 8. The variance will be subjected to public notice, comment and hearing. See CWA section 303(c)(1) and 40 CFR 131.20. The public notice should contain a clear description of the impact of the variance upon achieving the water quality standard in the water body.

(*8) See CTR Preamble at pg. 42185-6. Further guidance on variance policies is provided in EPAs 1994 Water Quality Standards Handbook, Chapters 2 and 5 (EPA 823-B-94-005a, August 1994).

Comment: Implementation

Although the proposed Rule discusses implementation issues such as TMDLs, variances, SSOs, and interim permits, it lacks evidence of support for any of these provisions. We believe that this will have the effect of reducing the State's confidence or perceived authority in granting any of these provisions to individual POTWs. For example, Page 42186 of the CTR lists six criteria that must be used by the State to determine the non-attainability of a water quality standard; we are doubtful that any of these criteria would be strictly applicable to our facilities with respect to lindane and DDT. We believe CTR variance criteria should include economic considerations for specific discharger implementation efforts. Unless the EPA provides more support for these provisions, we fear that the State will either not grant us a legitimate variance or will waiver in its commitment to act at all.

Response to: CTR-057-010b

See response to CTR-004-007.

Furthermore, the six criteria that are used as a basis for a variance does include economic considerations (see preamble of the proposed rule 62 FR 42186, August 5, 1997 and the Water Quality Standards Regulation at 131.10(g)). The requirements for issuing a variance are the same as those for downgrading or removal of a designed use. Discussions on alternative justifications for variances are outside the scope of today's rule.

Comment: Variances This procedure described in the preamble is unduly cumbersome and unrealistic. Particular problems we see with this approach are:

Time limit - The proposed policy requires that variances be granted for not more than three years, after which they must be re-justified. This policy is not reasonable when applied to a major municipal wastewater construction program which may have a variance as an integral part of the facility planning process. Does it make sense to reanalyze a fundamental design premise every three years for a wastewater system that may have cost hundreds of millions and taken decades to construct. Although review of facility plans is appropriate in some cases, following the laborious process every three years as described in this proposal would have no benefit since there is no feasible way to instantly change a completed wastewater system.

Regulatory justification - EPA has modeled the variance procedure on the portion of the regulations established to provide for removal of a designated use. What is left out of the preamble is a justification for using this model for the additional requirements added to the procedure. Why, in the first place does EPA need to establish a variance procedure. The Clean Water Act requires the state have standards which 'shall be such as to protect the public health and welfare, enhance the quality of water and serve the purposes of this chapter." Each Basin Plan in California already has a variance policy which meet this statutory requirement and which is currently in effect. We propose that there is no need for the variance procedure in this rule-making.

Conflict with the fundamental premise of state water quality standards The major problem with the proposed variance procedure is that it is in conflict with the underlying premise upon which the standards were originally developed. The standards in California were developed to be applied to permanent dischargers such as POTWs and industrial discharges. The state explicitly recognized that the standards were inappropriate for intermittent discharges such as combined sewer overflows. Because the standards were not appropriate for CSOs, the state intended that the variance procedure be used. Taking as an

example, the Ocean Plan standards applied to the first San Francisco permits, the SWRCB made the following statement:

... it is patiently clear that it was realized it inappropriate to apply Ocean Plan standards strictly to combined waste and stormwater discharges. The record indicates further, that rather than address this problem in the 1978 Ocean Plan amendments, directly, it was decided to deal with such problems on a case-by-case basis via the exception mechanism. [Order No. WQ 79-16].

The same argument applies to stormwater discharges. Since most such discharges will violate the current standards during at least some period during the discharge, it is obvious that the intent of those developing the standards was not to apply them to intermittent discharges in the same manner as they are applied to permanent discharges. Until the standards are changed, the variance process is the only available mechanism to reconcile the standards with these discharges.

In order to minimize paperwork, and to provide more meaningful public participation, we suggest that all remaining variances be handled has part of the Basin Plan process ,(by watershed and discharger class) rather than on an individual NPDES permit basis.

We further request that all existing variances be incorporated into the CTR by reference. This could be handled by listing the currently applicable Basin Plans and adding language to the effect that "...all variances issued pursuant to these plans are incorporated into the CTR by reference." San Francisco has variances and/or site-specific discharge standards associated with its wet-weather control facilities (RWQCB(2) Order 94-149 as amended by Order 96-117, Southeast WPCP, and Order 95-039, Northpoint and Southeast Sewerage Zones).

Response to: CTR-090-020

EPA disagrees that a three year time limit for variances is unreasonable. The variance represents a change in the applicable water quality criteria. Variances are optional components of a state's water quality standards. As noted in the preamble, EPA's policy on variances is that variance are granted for a specific period of time and must be rejustified upon expiration but at least every three years. The three year rejustification is derived from the triennial review requirements of CWA Section 303. Section 303 requires States to hold hearings for the purpose of reviewing and, if necessary, revising their water quality standards.

EPA notes that the Agency is not including or establishing a variance procedure for California in this rule. Rather, the preamble of the rule explains minimum requirements for State adopted variance provisions. As previously noted, such provisions are optional policies that states in general adopt to assist in the implementation of their NPDES permit program. See response to CTR-004-007.

Comment: Variances

The City strongly supports the application of variances as an important regulatory procedure to assist the State in implementing its water quality standards program. The City further encourages the State to formally adopt a variance provision that allows variances for individual dischargers. This procedure would provide a valuable tool to allow a permittee to achieve reasonable progress toward attainment of a water quality based effluent limitation without violating applicable water quality standards.

Response to: CTR-092-008

EPA takes no position as to whether the State adopts a variance provisions in its water quality standards.

Comment: There are good things in here regarding the variances and the recognition of the existence of ephemeral streams. And the naturally occurring pollution, you know, has to be taken into account when it actually applies to water quality standards.

I would observe in that regard that the NPDES program recognizes that intake credits may sometimes be appropriately applied to adjust effluent limits. But in the NPDES language it states that that only can occur when you discharge into the same water body that you take the water from.

In our case, of course, we use groundwater. And, as an example, it may contain arsenic. And the arsenic isn't really removed from the water before it is discharged to surface water. We don't fit the mold of being authorized those intake credits, because we're not discharging into the same water body that we draw water from.

Comment: Some of the flexibility that the City highly supports is the water effect ratio investigations to adjust statewide criteria to site-specific conditions; the interim limits concept while special studies are being conducted by the dischargers and other entities; a variance procedure to allow dischargers to achieve progress toward effluent limit attainment without violating applicable water quality standards; dissolved criteria for metals to reflect the toxicological conditions; translators to adjust dissolved criteria to total permit limitations; trading programs to attain and maintain water quality; and a mixing zone that reflects true instream pollutant conditions and that protects beneficial uses.

Response to: CTRH-001-057d

EPA acknowledges the commenter's support for variances, However, EPA is not including a variance procedure in today's rule. See response to CTR-004-007.

Comment: The Victor Valley Wastewater Reclamation Authority (VVWRA) respectfully requests that the comment period deadline be extended for the California Toxics Rule (CTR). The current comment period deadline is September 26, 1997. We request that the latter deadline be extended for at least 60 days so that we can fully evaluate the potential impact on VVWRA

The reasons for our request are as follows:

1. VVWRA discharges to the Mojave River, which is considered by the Lahontan RWQCB as an impaired waterway. Although portions of the Mojave exhibit year-round surface flow, the River directly above VVWRA does not exhibit consistent surface flow. However, the Lahontan RWQCB considers the Mojave an underflow stream, which is often considered as surface flow. Whether an underflow stream would be considered under the CTR for receiving stream dilution has yet to be determined;

2. It is difficult if not impossible to evaluate the impacts of a proposed regulation without considering the mechanism by which it will be implemented. The SWRCB is not expected to release the implementation plan until September 12, 1997. Therefore, VVWRA takes exception to the imposition of a regulation with an undefined implementation plan;

3. Because of the latter unknowns and the complexity of the regulation V has not had sufficient time to evaluate the potential economic impacts, if any, of the proposed regulation.

Comment: PROVISIONS OF THE PROPOSED RULE WE SUPPORT

Not withstanding the above comments, we believe there are certain elements of the proposed rule with respect to establishing water quality standards that we can support:

* Metal criteria expressed in the dissolved fraction rather than expressed in the total recoverable fraction.

* Metal criteria that are developed as a function of the water-effect-ratio (WER).

* The current proposed human health criterion for mercury.

* The current preamble language regarding metal translators and mixing zones.

We believe the above provisions provide a more acceptable, scientific approach to the water quality-based pollution control approach. We recommend these provisions of the current rule remain as proposed.

Comment: D. EPA's Discussion of the Chemical Translator Guidance Should be Clarified

EPA appropriately includes its recently completed Chemical Translator Guidance (The Metals Translator: Guidance for Calculating a Total Recoverable Permit Limit From a Dissolved Criterion (EPA 823-B-96-007, June 1996) (Translator Guidance) in the rulemaking record and notes the importance of having mechanisms to "translate" between dissolved metal in ambient waters and total recoverable metal in effluent. 62 Fed. Reg. at 42,173, col. 2. But EPA's discussion of only certain provisions of the Translator Guidance creates an implication that only those portions of the Translator Guidance are applicable to this rulemaking. For example, the proposal requires use of conversion factors for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved criterion in the water column. The Translator Guidance provides greater flexibility; it states: "[A] translator is required to derive a total recoverable permit limit from a dissolved criterion" but caveats this statement with the following footnote:

As a reasonable worst case, however, it may be assumed that metal in the receiving environment would be biologically available to the same extent as during toxicity testing; and the conversion factors may be used as translators if a site-specific translator is not developed. In that case, the water quality criterion that already has been multiplied by the conversion factor would be divided by the conversion factor.

Translator Guidance, p. 5, n. 6.

Therefore, to avoid any implication that only part of the Translator Guidance is applicable to this rulemaking, UWAG requests that EPA make general reference to the translator Guidance and approve, without reservation, its entire contents.

Response to: CTR-030-008

EPA clarifies that the State in implementing its policy on translators may consider the entire contents of the guidance. EPA did not intend to imply that only a portion of the guidance could be used by the State to implement CTR criteria.

Comment: Regulatory Flexibility and Relief

The District supports EPA's use of "sound science" and current data in developing the proposed criteria in the California Toxics Rule (CTR). The District strongly supports language in the Preamble that references and endorses recommendations of the State Task Forces including use in permitting of:

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Comment: Second, we commend EPA for its inclusion in the CTR of several innovative and flexible regulatory approaches, such as metals criteria expressed as dissolved rather than total recoverable concentrations, and the revised human health criterion for mercury. In addition, in light of the issues surrounding the human health criteria for arsenic we support EPA's decision not to promulgate human health criteria at this time. With respect to implementation issues discussed in the Preamble, we support EPA's policies and guidance regarding the application of mixing zones and dilution credits. the use of interim permit limits while Total Maximum Daily Loads (TMDLs) and other special studies are being

performed, and EPA's guidance to Regional Water Quality Control Boards (RWQCBs) that they may use any of the methods described in EPA's guidance document on the use of translators. We also support EPA's proposal to create a rebuttable presumption for Water Effects Ratios (WERs), allowing the RWQCBs and SWRCB to develop site-specific WERs that can be approved by EPA during the NPDES permit approval process. We believe that this approach will help facilitate the development of appropriate site-specific adjustments for metals criteria.

Comment: p. 42173 -- Translators for Dissolved to Total Recoverable Metals Limits We support EPA's guidance to RWQCBs that they may use any of the methods described in EPA's guidance document on the use of translators (U.S. EPA, 1996b). We believe that the development of site-specific translators should be allowed in those cases where a discharger is willing to conduct the studies in accordance with EPA-approved methods. As such, we believe the recommendation that the State "adopt a statewide policy on the use of translators so that the most appropriate method or methods are used consistently within California" is unnecessary, and this recommendation should be deleted from the Preamble.

Response to: CTR-035-018

EPA believes its recommendation that the State "adopt a statewide policy on the use of translators so that the most appropriate method or methods are used within California" is useful. This recommendation does not preclude the State from allowing dischargers to conduct site-specific translator studies in accordance with EPA methods if the State so chooses within its discretion to write NPDES permits. In fact, in its proposed implementation policy, the State's expressed its acceptance of site-specific translator methods.

Comment: PROVISIONS SUPPORTED

We support a number of provisions of the Rule, including: (1) adoption of metals criteria as dissolved concentrations; (2) expression of the metals criteria as a function of the water-effect ratio; (3) adoption of the proposed new human health criterion for mercury- and (4) the Preamble discussions regarding metals translators and mixing zones. These provisions provide a firmer scientific base for the water quality-based approach to pollution control and are a marked improvement over the old Inland Surface Waters Plan. We would urge EPA to retain these provisions in the final Rule.

Comment: Second, the District supports with reservations EPA's proposals on two subjects directly related to dissolved metals criteria, i.e. the proposed guidance on both (1) translators to convert from dissolved metals criteria to total recoverable permit limits and (2) the water-effect ratio (WER) as the method to compare the bioavailability and toxicity of a pollutant in receiving waters and in laboratory waters. Both of these two proposals must be implemented on a site-specific basis using local data, not statewide or watershed-wide data. Translators, however, should be developed whenever a discharger is willing to conduct studies in accordance with EPA-approved methods. The proposed procedure for a default value of 1.0 for a WER should mean that when a site-specific WER is to be determined, an additional EPA rulemaking process would not be required. Instead, this rule should pre-authorize the use of correctly applied WERs that are approved by the State.

Response to: CTR-041-003a

EPA agrees that translators derived using site-specific methods are generally preferable to a generic method using statewide or regional data. However, the State is the lead authority with respect to NPDES permit implementation and may choose any method that is consistent with the Clean Water Act. In its proposed implementation policy, the State expressed its acceptance of site-specific translator methods.

Comment: We have reviewed the proposed CTR and offer the following comments:

2. The following provisions of the rule are supported:

(1) adoption of metals criteria as dissolved concentrations;

(2) expression of the metals criteria as a function of the water-effect ratio;

(3) adoption of the proposed new human health criteria for mercury; and

(4) the Preamble discussions regarding metals translators, mixing zones, and interim permit limits.

Were the old human health criterion for mercury (0.012 ug/ l) to be adopted, the City would have to remove its discharge from Tule Canal and go to land disposal. The capital cost to do this would be $22.1 million and the total present worth cost would be $23.1 million (see Exhibit B, Required Capital improvements and Costs for Beryllium and Mercury). This would translate to an annual cost of $3.1 million per year (at 7% over 10 years) and would require that monthly sewer service charges be increased by more than 100%.

Response to: CTR-044-003d

See response to CTR-004-004d.

With respect to the comment about the economic impact of the old criterion for mercury of 0.012 ug/l, EPA has not evaluated these costs since the CTR does not promulgate a mercury criteria of 0.012 ug/l.

Comment: BADA supports the Preamble discussions regarding metals translators, mixing zones, and interim permit limits. Translators and mixing zones will provide a better scientific basis for the application of the criteria and will go a long way toward protecting against the imposition of unnecessary or unreasonable controls. Interim permit limits will allow dischargers faced with potential attainability problems to pursue reasonable actions, such as pollution prevention, treatment plant optimization, pollutant trading, TMDLS, etc. prior to being faced with final effluent limitations. BADA endorses the recommendation of the State Plan Public Task Forces on the issue of interim limits.

Comment: PROVISIONS SDG&E DOES NOT SUPPORT

As described in the following comments SDG&E does not support the following provisions:

EPA's chemical translator guidance should be clarified

EPA describes in the preamble (see 62 Fed. Reg. at 42,173, Col. 2) the importance of permitting authorities of having the ability to translate between dissolved metals in ambient waters and total recoverable metal in effluent and refers to its Chemical Translator Guidance document "The Metals

Translator. Guidance for Calculating a Total Recoverable Permit Limit From a Dissolved Criterion"(EPA 823-B-96-007, June 1996) (the "Translator Guidance"). However, the preamble describes only certain provisions of the translator guidance document, implying that other portions may not be applicable to California. EPA should clarify the translator guidance document is applicable in its entirety to California.

Additionally, the preamble should specifically identify, as the Translator Guidance indicates in footnote No. 6 on Page 5, that, in the absence of a site-specific translator, the conversion factor should be used as the translator.

Comment: The draft California Toxics Rule (CTR) is clearly the product of substantial effort by USEPA staff, and we applaud this effort and its intent. On several issues of concern to public utilities, the CTR strikes a good balance between the need to promulgate standards and the need to base those standards on sound science. Examples include the use of dissolved concentrations rather than the total recoverable concentrations for metals, the deferral of human health criteria for arsenic until adequate information is available, and the revision of the human health criterion for mercury. We are also pleased with the

CTR's guidance and flexibility, on mixing zones and dilution credits, total maximum daily loads (TMDLs), compliance schedules, and translators.

Comment: Translators to Convert from Dissolved Metals Criteria to Total Recoverable-Permit Limits

The City supports EPA's discussion of the metals translation process contained in "The Metals Translator, Guidance, for Calculation of a Total Recoverable Limit From a Dissolved Criterion" (EPA 823-B-96-007, June 1996). The City supports the use of EPA's translator methods by Regional Water Quality Control Boards to develop water quality-based permit limits. The Cityalso supports EPA's encouragement for the development of a statewide policy on the use of translators and for the consistency of their use statewide.

Comment: The notion of translators is a scary one to me in terms of what that means for any given permit process. You're talking about a very complicated permit process at that point, and I don't expect certainly the dischargers to pass up that opportunity. I would expect to see a very complicated permit process for every single one of the criteria that you have proposed here, unless you include a total recoverable number.

Response to: CTRH-001-049

EPA believes translators for metals is an appropriate tool for converting from dissolved metals criteria to total recoverable permit limits. Dissolved criteria are applicable only to a subset of priority toxic pollutants and would not be applicable to all criteria in the final rule. While the use of translators may make the permit process somewhat more complex, in some cases, EPA believes this extra effort will be worthwhile and will allow the State to develop the most appropriate effluent limits for metals discharges.

EPA's basis for using dissolved metals is described in the preamble to the proposed CTR at 62 Fed. Reg. 42171 (Aug. 5, 1997), the preamble to the final rule, and in the administrative record to the final rule (PLACEHOLDER FOR DOCUMENT TITLE).

Comment: Some of the flexibility that the City highly supports is the water effect ratio investigations to adjust statewide criteria to site-specific conditions; the interim limits concept while special studies are being conducted by the dischargers and other entities; a variance procedure to allow dischargers to achieve progress toward effluent limit attainment without violating applicable water quality standards; dissolved criteria for metals to reflect the toxicological conditions; translators to adjust dissolved criteria to total permit limitations; trading programs to attain and maintain water quality; and a mixing zone that reflects true instream pollutant conditions and that protects beneficial uses.

Comment: Thank you for the opportunity to comment on the proposed California Toxics Rule. The City's comments are related to five main concepts:

4. The environmental consequences of the necessary treatment facilities and changes in operating practices to meet these discharg5 standards is very significant and has not been addressed in promulgating the proposed rule.

Specifically, the City submits the following comments:

F. A comparison of the Water Quality Standards (WQS) used by its City during the Local Limits Study and the proposed WQS is shown in Table 1. There is a little variation in limits for cadmium, copper, nickel, and zinc as these values are dependent on receiving stream hardness. The values shown in Table I for the City were developed using a hardness of 170 mg/l as CaCO3 while the standards from the CTR are based on 100 mg/l as CaCO3. The WQS from the CTR are actually expressed as dissolved fractions. A factor of I has been used to convert from dissolved to total fractions for the comparison to take place.

Table 1

Comparison of Water Quality Standards

	City Report		WQS		1996		1997	
	Chronic	Acute	Chronic	Acute				
Arsenic, ppb	190.0	360.0	150.0	340.0	Cadmium, ppb	1.7	7.1	2.2
4.3	Chromium, ppb	10.0	15.0	11.0	16.0	Copper, ppb	19.0	29.0	9.0
13.0	Nickel, ppb	250.0	2200.0	52.0	470.0	Zinc, ppb	170.0	180.0	
120.0	120.0	Mercury, ppb	N/A	2.1	.77	1.4			

Table 1 indicates that the City's Local Limits for arsenic, cadmium, chromium, and zinc would have little difficulty meeting the CTR. However, limits for copper, nickel and mercury may be drastically impacted. This impact in developing a stricter local limit may result in an economic hardship to many small business enterprises that currently do metal plating. These businesses may be forced to close down due to the implementation of these limits. Modesto experiences a chronic unemployment rate above 12%, and economic development is critical to this community.

Response to: CTR-096-004a

The commenter has not provided enough information to enable EPA to respond to the assertion that metal plating businesses in Modesto may endure economic hardship and be forced to close down due to implementation of the CTR.

The commenter's derivation of 1997 WQS in Table 1 appears to be based on the CTR criteria. This is a "worst case scenario" since it does not address possible adjustments (all allowable for implementation of the CTR) for dilution, hardness, and translation from dissolved criteria to total recoverable effluent limits, all of which could result in an effluent limit for the POTW that may be less stringent than the levels indicated in Table 1. In addition, the commenter did not provide information on how local limits for indirect dischargers (such as metal plating businesses) would be calculated nor any data on historical discharge levels of pollutants from metal plating businesses. Therefore, EPA cannot come to any conclusion whether the implementation of CTR water quality criteria could have an adverse economic impact on Modesto's metal plating businesses or force the businesses to close.

EPA notes that the comment regarding the stringency of proposed aquatic life mercury criteria is no longer relevant since EPA is not promulgating a final aquatic life mercury criteria in the final CTR.

Comment: ISSUES OF CONCERN

F. 3. Implementation, 62 FR 42185. Total Maximum Daily Load (TMDL's) should not be required if water quality criteria for a water body segment are exceeded due to discharges from upstream dischargers who operate with federal waivers or variances to water quality standards.

F. 3. Implementation, 62 FR 42184. The proposed California Toxics Rule (CTR) does not specifically afford municipal credits for pollutants in the intake water supply. The City of Redding is concerned about how the proposed CTR will be implemented with regard to upstream acid mine dischargers who are operating with federal waivers to water quality standards. If credits for pollutants in the intake water supply were intended, they should be specifically included in the current proposal under F. 3. Implementation, to allow public comment at this time.

BACKGROUND

Previous Task Force and Sacramento River Watershed Program discussions and recommendations to the EPA have focused on acid mine discharges (AMDs) to the Sacramento River, as sources that are largely unregulated and contribute great amounts of metals to the river. The City of Redding has annually commented in our pretreatment program reports, on the deleterious affect of upstream heavy metal discharges from Iron Mountain Mine (IMM) into the Sacramento River and the downstream City water supply.

Prior to classification as a superfund site, IMM had previously been under a NPDES permit issued by the Central Valley Regional Water Quality Control Board. A review of a fact sheet by EPA on Iron Mountain Mine Superfund Site (May 1996) indicates the IMM site: under Superfund law, requires EPA cleanup actions to comply with all federal and state environmental requirements or of applicable or relevant and appropriate requirements" (ARARs), but allows a waiver of those requirements for interim actions such as collection and treatment of IMM Slickrock Creek flows. Although the interim actions will provide an environmental improvement, they are not expected to achieve full compliance with all of these environmental requirements. The fact sheet references that the ARARs waiver for "Interim Measures" is provided for under 40 CFR 300.430 (f)(1)(ii)(C)(1) and invited comment on whether it would be appropriate to rely on a waiver of these standards on the basis of "technical impracticability" under 40CFR 300.430 (f)(1)(ii)(C)(3).

Presently and for an indefinite period of time, IMM will remain without water quality criteria (WQC) compliance requirements. Additionally, it appears that there will be no enforcement actions against IMM

for failure to comply with WQC requirements. Apparently, this will not be the case for municipalities downstream of this and other AMDs on the Sacramento River according to the proposed CTR.

Monitoring of heavy metal concentrations in the Sacramento River by the City of Redding, indicate IMM interim actions implemented to date have produced an environmental improvement; however, the Sacramento River still violates water quality criteria proposed in the CTR. The very fact that the river will continue to experience violations of the proposed water quality criteria makes continuous POTW NPDES compliance impossible during AMDs upstream excursions of these same criteria. It would be unfair and cost prohibitive to require downstream POTW's to comply with increased water quality standards, where the water body quality has been significantly degraded because of the actions or inactions of the federal and state regulators on upstream discharges.

The City of Redding discharges back into the same water source (Sacramento River) from which it receives its primary municipal intake water. Wastewater discharge compliance with the proposed WQC would be very problematic, as ambient Sacramento River concentrations of heavy metals can fluctuate widely and be higher than the proposed WQC during any given river monitoring event. In contrast to theoretical models which assume the worst case scenario occur during low river flows, the upper Sacramento River commonly experiences the highest metal concentrations during high winter flows.

Even though the City of Redding does not have NPDES permit limits for metals at the current time, we must assume it will some day. Therefore, the above issue is significant and in need of comment at this time.

SUMMARY

Federal Regulations contained within the proposed CTR prohibit the discharge of toxic constituents in toxic concentrations. Iron Mountain Mine, as a superfund site discharger to the Sacramento River, will not fall under the proposed CTR due to the federal waiver granted to them in 1996. The proposed CTR should address the issue of effluent limit adjustments based upon intake water concentrations from upstream AMDs and provide a means of implementing a fair and affordable approach to adjust or provide relief to municipalities whose sources of water are already at or above the proposed water quality criteria. The City of Redding believes it is urgent that U.S. E.P.A. include in the preparation of the final California Toxics Rule, effluent limit adjustments based upon intake water ambient concentrations due to AMDs or other upstream toxics for all applicable water bodies found within the State of California.

Therefore, we request that language be added to the proposed rule as follows, "Any discharger downstream of a water body which has been granted a federal or state variance or waiver, and whose primary source of water supply is impaired by such shall be allowed credit in their NPDES discharges by either 1) an extension of that variance or waiver to affected downstream dischargers and/or 2) allowing intake credits to affected downstream dischargers."

If you have any questions, please contact Wastewater Superintendent Stephen Craig at (916) 224-6063 or Industrial waste Supervisor Richard Elliott at (916) 224-6050.

Response to: CTR-084-001

The State has discretion to use implementation tools such as appropriate intake credits to apply to dischargers that have poor intake or receiving water which is beyond their control. Implementation of water quality standards through various regulatory and non-regulatory tools is primarily a State responsibility and is beyond the scope of the CTR. Since the proposed CTR was issued, the State

released a draft Policy for Implementation of Toxic Water Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, September 11, 1997. The draft policy included a provision for intake water credits (See pp. V-60-V-70). EPA has provided a copy of your comments to the State Water Resources Control Board for consideration.

Comment: THE PROPOSED RULE DOES NOT COMPLY WITH THE PAPERWORK REDUCTION ACT

The preamble states at page 42192 that the CTR "requires no new or additional information collection." It is difficult to believe that a rule which, unless modified, may effectively require end-of-pipe treatment of storm water discharges would not require any "additional information collection." For example, simply a demonstration that WQBEL's are infeasible requirements for either municipal storm water permits would necessarily require an significant amount of additional data collection and reporting. USEPA should have conducted a full analysis of the potential information gathering requirements of the CTR before proposing this rule.

The preamble to the proposed rule sets forth in detail the various efforts that USEPA employed to obtain public input on the CTR. However, to our knowledge, none of the cities on whose behalf we are submitting these comments, nor any of the other cities which we represent were contacted by EPA in advance of the proposed rulemaking or given a reasonable opportunity to participate.

In closing, we join in the requests made by other local governmental entities that the proposed rule be modified to exclude any application to storm water discharges to municipal separate storm sewer systems.

RICHARDS, WATSON & GERSHON 333 So. Hope Street, 38th Floor Los Angeles, California 90071

John J. Harris

Response to: CTR-019-004b

EPA disagrees with the commenter that the proposed CTR does not comply with the Paperwork Reduction Act, and that the CTR will impose new, additional requirements on storm water dischargers. The preamble states that the action requires no new or additional information collection subject to the Paperwork Reduction Act. The CTR promulgates water quality criteria for priority toxic pollutants. The State is required to implement water quality criteria through its water quality control programs, specifically through the NPDES permit program. The State implements water quality-based effluent limitations or WQBELs in NPDES permits for any pollutant for which reasonable potential exists. Thus, the CTR does not directly place any requirements on any discharger.

Reporting and monitoring requirements already exist for all NPDES dischargers, including storm water dischargers, under the NPDES regulations. The CTR does not impose any additional reporting or monitoring requirements. As noted above, the CTR promulgates criteria for toxic pollutants, and the State will use the criteria in developing water quality-based effluent limitations in NPDES permits for the pollutants where reasonable potential exists. The rule does not impose any additional reporting or monitoring burden on any discharger.

The CTR poses no direct information collection burden on the State of California. The CTR places an indirect burden for reviewing and revising the toxic pollutants that were promulgated. (See the National Toxics Rule discussion of the Paperwork Reduction Act at 57 FR 60848, Tuesday, December 22, 1992.) The general Water Quality Standards regulations Information Collection Request (ICR) estimated an average indirect burden on respondents (States) for reviewing and revising water quality criteria, and toxics criteria are merely a subset of those criteria. Thus, the CTR poses no direct burden, and any indirect burden on the State for a required triennial review has been estimated and updated in the general Water Quality Standards.

EPA acknowledges the comment concerning EPA's outreach to the public for input. In 1995, EPA sent out a newsletter to all interested parties, including all NPDES permit holders in the State of California, soliciting comments and attendance at public meetings. EPA held two public meetings on August 24, 1995 in San Francisco, where again comments were solicited from the discharger community, including storm water dischargers. In addition, EPA attended each of the State's Task Force Meetings for the development of the new statewide implementation plan; the storm water discharger community was invited to attend all of these meetings. EPA was available to the public for questions and answers on both the CTR and the State's proposed implementation. Reasonable opportunity existed for the storm water community to submit input on the CTR.

Response to: CTR-019-004a

EPA's EA, which uses many conservative costing assumptions, indicates that the cost of the State implementing water quality standards based on the proposed criteria in the CTR is likely to be below $100 million per year. Benefits are also estimated to be below $100 million per year. These estimates indicate that the action is not "significant" under E.O. 12866, under the provision concerning annual effects on the economy.

Criteria, by themselves, do not directly impose economic impacts. Criteria are one of three parts of a water quality standard. A water quality standard is comprised of: a criterion, a designated use, and an

antidegradation requirement. The CTR promulgates criteria for priority toxic pollutants. When these criteria are combined with State adopted designated uses and antidegradation requirements, water quality standards will be created. When the State implements these water quality standards, costs may be imposed. However, in the spirit of the intent of E.O. 12866, EPA prepared the EA which looks at the costs and benefits of the State's implementation of the resulting water quality standards based on the CTR criteria into the NPDES permit program.

The Unfunded Mandates Reform Act of 1995 (UMRA) in general requires federal agencies to assess the effects of their regulatory actions on State and local governments, and on the private sector. The agency must prepare a written statement including a cost-benefit analysis for actions with a "federal mandate" that may result in expenditures to State and local governments, in the aggregate, or to the private sector of $100 million or more in any one year. The CTR does not contain any federal mandate that may result in expenditures by State and local governments, or the private sector, of $100 million or more in any one year. The CTR imposes no direct enforceable duties on the State, local or private sector; rather the rule promulgates water quality criteria which, when combined with State-adopted designated uses and antidegradation requirements, will create water quality standards. The CTR does not directly regulate or affect any entity and therefore is not subject to the requirements of UMRA.

The Regulatory Flexibility Act in general requires federal agencies to describe the impact of their regulatory actions on small entities as part of the rulemaking. If the Administrator certifies that the action will not have a significant economic impact on a substantial number small entities, the agency is not required to prepare the analysis. The Administrator certified in the proposed rule, and is certifying again today that the rule will not have a significant economic impact on a substantial number of small entities. EPA's promulgation of water quality criteria will assist the State in establishing water quality standards. The State will, in turn, implement the resulting water quality standards in its water quality regulatory programs such as the NPDES permit program. The State has discretion in deciding how to meet the water quality standards and in developing discharge limits as needed to meet those standards. While the State's implementation of water quality standards based on federally-promulgated criteria may result in new or revised discharge limits being placed on small entities, the criteria or standards themselves to not apply to any discharger, including small entities. Thus, EPA's action today does not impose any of these as yet unknown requirements on small entities.

As described in EA that accompanied the proposed CTR (SAIC and Jones and Stokes Associates, 1997), EPA assumed that regulatory alternatives such as phased total maximum daily loads/water quality assessments, site-specific criteria modifications, standards variances, metals translators, etc., are considered under certain circumstances. Specifically, under the low-end scenario, regulatory alternatives were assumed necessary if the cost for a sample facility exceeded $200 per toxic pounds-equivalent.

EPA assumes that a facility, when faced with the challenge of meeting water quality-based effluent limitations (WQBELs) based on CTR criteria, will select the most cost-effective controls, including regulatory alternatives. In fact, this has been the case in California, where several major POTWs have performed studies in pursuit of regulatory alternatives such as metals translators and site-specific criteria, rather than install costly controls to comply with WQBELs. EPA acknowledges that the actual cost-effectiveness value will vary by facility depending upon many factors, including the characteristics and volume of discharge, the receiving water, etc. However, EPA disagrees that the cost trigger is unrealistic, as it was reasonably based upon the highest reported cost-effectiveness values for industry categories subject to effluent limitations guidelines and standards.

Nonetheless, in the high-end estimate developed for the cost analysis accompanying the final CTR, no cost trigger was used and, thus, EPA's high-end cost estimate did not include the use of a regulatory

alternative for any sample facility.

Comment: D. EPA's Endorsement of Five-Year Compliance Schedules and Interim Permit Limits for Modifications is Appropriate

UWAG strongly supports EPA's recognition that modifications necessary to comply with new or more stringent effluent limitations may necessitate the use of five-year compliance schedules. 62 Fed. Reg. at 42,187, col. 3. UWAG believes, however, that in certain circumstances a longer compliance schedule may be appropriate. Steam electric facilities that need retrofits to meet water quality-based effluent limits (WQBELS) often require extensive engineering design and testing prior to the actual retrofit. Additionally, nuclear facilities must ensure that any design changes are compatible with Nuclear Regulatory Commission regulations. Therefore, the availability of five-year compliance schedules is certainly well-justified. Further, EPA should consider whether longer compliance schedules should be available, at least in some limited circumstances.

Additionally, UWAG strongly supports EPA's approval of interim permit limits for use in permit modifications. This flexibility will allow dischargers to stay in compliance while necessary process or design changes are carried out.

Response to: CTR-030-004c

EPA dropped its proposed five year compliance schedule from the final CTR. Based on public comments, EPA has determined that, in California, establishment of a compliance schedule is an implementation issue. Thus, the State should have discretion to establish a compliance schedule subject to EPA approval.

Comment: If the proposed rule is carefully and sufficiently modified to affirm a commitment by EPA to effect only its Congressional authorization as established by CWA section 402(p), then EPA's failure to assess municipal storm water dischargers" ability to attain the proposed standards and associated economic and environmental impacts may be set aside at this time. However, if EPA persists in maintaining the CTR as drafted in this regard, the ambiguities presented in the preamble demand serious consideration and analyses as follows.

a. Many of the criteria are not attainable or scientifically valid with regard to municipal stormwater dischargers, nor is the proposed approach consistent with an appropriate delegation of authority to the State.

ii. Scientific Defensibility of Standards

Municipal storm water discharges require a uniquely different scientific as well as regulatory approach. The episodic nature of storm flow events; the huge variances in flow volume, rate, timing, concentrations, and loads; the variability in receiving waters; and organism tolerance for and recovery f rom episodic exposure need to be taken into account in developing standards.

In a July 1992 memorandum addressing a Combined Sewer Overflow/Wet Weather workshop, Tudor Davies, Director of EPA's Office of Science and Technology wrote: "Changes being considered in the aquatic criteria development methodology to enhance the scientific defensibility of the criteria would be applicable to both constant and to wet weather discharges. One such change undergoing consideration is a change in the duration and frequency of exposure assumptions to make criterion more toxicologically realistic.

EPA has begun this work and is apparently nearing completion. With EPA's own Science and Technology office recognizing the inadequacy of the current approach to setting criteria relative to wet weather discharges, it must be concluded any attempt to apply the CTR criteria to municipal stormwater system discharges is ill-founded and likely inconsistent with the CWA.

Response to: CTR-031-004c

EPA believes the CTR is consistent with current State and federal regulatory approaches. Regarding the comment that the CTR is not coordinated with the State Implementation Procedures, the CTR and the State Implementation Plan have been coordinated by EPA and the State in order to be made effective in a similar timeframe. In addition, EPA will review the State Implementation Policy for consistency with the Clean Water Act.

The comment regarding NEPA and ESA review assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in Comment ID CTR-001-002, EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

EPA's interim policy regarding application of the CTR to storm water dischargers is described in response to Comment ID CTR-001-002. The issue raised here is more one of how criteria are implemented for storm water dischargers and not the criteria themselves, which are developed to be protective of aquatic life and human health. In addition, the criteria are biologically based and, as such, if applied with the appropriate duration and frequency for storm water events, reflect a biologically-based approach.

Comment: If the proposed rule is carefully and sufficiently modified to affirm a commitment by EPA to effect only its Congressional authorization as established by CWA section 402(p), then EPA's failure to assess municipal storm water dischargers" ability to attain the proposed standards and associated economic and environmental impacts may be set aside at this time. However, if EPA persists in maintaining the CTR as drafted in this regard, the ambiguities presented in the preamble demand serious consideration and analyses as follows.

a. Many of the criteria are not attainable or scientifically valid with regard to municipal stormwater dischargers, nor is the proposed approach consistent with an appropriate delegation of authority to the State.

iii. State Flexibility and Authority

The CTR states, "The criteria established in this section are subject to the State's general rules of applicability in the same way and to the same extent as are other Federally-adopted and State adopted numeric toxics criteria when applied to the same use classifications..." p. 42206

[INDENT]This language supports State Water Resources Control Board decisions and the San Francisco Basin Plan which have made it clear that municipal storm water dischargers need to address water quality standards only through the implementation, and escalation as necessary, of best management practices. As noted previously, the language of this section must be better supported in the preamble.

Notwithstanding the above statement on page 42206, the CTR actually diminishes state flexibility in implementing the rule and is inconsistent with state compliance schedules. The CTR mandates implementation limits on the state and implies a 5-year limit on compliance.

A five-year compliance schedule for municipal storm water dischargers is entirely inconsistent with the State's, EPA'S, and Phase II stakeholder's understanding of the unique challenges of storm water permitting. The draft Phase II regulation submitted to OMB includes a comprehensive reevaluation of

storm water programs after two permit terms, and recommends no added best management practices or changes in the Phase II program until such evaluation and research are completed.

Response to: CTR-031-005b

See response to CTR-040-004.

EPA believes the CTR is consistent with current State and federal regulatory approaches. Comment: We are concerned that the five-year compliance period for stormwater discharges to meet the criteria is untenable. The linkage between the application of best management practices and water quality benefits is long term and will thus be hard to demonstrate. Even in a direct product substitution situation, such as the removal of leaded gasoline from fuels, data from Orange County shows a very slow and long-term reduction in lead concentrations in our water bodies over multiple years.

Response to: CTR-036-010b

EPA dropped its proposed five year compliance schedule from the final CTR. Based on public comments, EPA has determined that, in California, establishment of a compliance schedule is an implementation issue. Thus, the State should have discretion to establish a compliance schedule subject to EPA approval.

Comment: 4. The CTR criteria are not appropriate for application to storm water discharges.

In addition to the fact that the CTR criteria are not applicable to municipal storm water discharges, the water quality criteria proposed in the CTR are also based on the continuous or steady flows associated with wastewater discharges. As such, these criteria may not be applicable to the intermittent flows associated with storm water discharges. It is Caltrans understanding that EPA Headquarters is currently reviewing the applicability of water quality criteria to wet weather discharges. Currently, there exists no published scientific study assessing the impacts of storm water discharges on the designated beneficial uses of receiving waters. Given the variability of storm water flows, discharge points, pollutant quantities, and quality, EPA might consider a different approach to adopting criteria that takes into consideration this variability.

Requests:

Caltrans requests that the CTR criteria not be applied to municipal storm water discharges.

Response to: CTR-042-004

See response to CTR-040-004.

Every two years, the California State Water Resources Control Board (SWRCB) submits a report on the State's water quality to the U.S. EPA pursuant to Section 305(b) of the Federal Clean Water Act. These reports present water quality assessment information compiled by California's nine Regional Water Quality Control Boards. SWRCB (1996) indicates that urban runoff and storm sewers are major and moderate sources of impairment of beneficial uses in estuaries, lakes and reservoirs, rivers and streams, and wetlands. The extent of this impairment is shown in the table below.

Sizes of Waters Impaired by Urban Runoff and Storm Sewers by Contribution to Impairment

Waterbody Type (Units)	Major^1	Moderate and Minor^2
Estuaries(Acres)	899	52,552
Lakes and Reservoirs (Acres)	120,320	7,985
Rivers and Streams (Miles)	92	1,620
Wetlands, Freshwater (Acres)	1	58,316
Wetlands, Tidal (Acres)	0	184

Source: SWRCB (1996).
1. A major contributor is a source that is either the only one responsible for nonsupport of any designated use or it predominates over other sources.
2. A moderate contributor is a source that is the only one responsible for partial support of any use, predominates over other sources of partial support, or is one of multiple sources of nonsupport that have a significant impact on designated use attainment. A minor contributor is a source that is one of multiple sources responsible for nonsupport or partial support and is judged to contribute relatively little to this nonattainment.

State Water Resources Control Board (SWRCB). 1996. California 305(b) Report on Water Quality. Prepared as Required in Clean Water Act Section 305(b). August.

Comment: Does the California Toxics Rule meet the legal requirements of the Clean Water Act and other federal policies and laws?

Previous municipal stormwater speakers have questioned, as we have, EPA's interpretation of Section 402(p) of the Clean Water Act. In addition, the California Toxics Rule raises significant questions regarding its conformance with other federal policies and laws including Executive Order 12866, the Unfunded Mandates Reform Act, the Regulatory Flexibility Act, and the authority for EPA to adopt blanket criteria without considering the designated uses of such waters as required under the Clean Water Act.

To give you just one example, I'd like to briefly compare the California Toxics Rule with the compliance of Executive Order 12866:

Under Executive Order 12866, any "significant" federal regulatory action must be referred to the Office of Management and Budget for review before it can be approved. In this context, a "significant" action includes one which will "have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy." Though admitting that there "may be a cost to some dischargers" to comply with the water quality standards that will be derived from these toxics criteria, the EPA nonetheless argues that the proposed rule is not a significant action because it "establishes ambient water quality criteria which, by themselves, do not directly impose economic impacts."

First, nothing in Executive Order 12866 indicates that only actions with direct economic impacts are to be considered by OMB. Second, for the EPA to ignore the link between the toxics criteria in the proposed rule and the obligations being imposed is very questionable. Is EPA conceding that State and regional water boards may simply ignore these criteria when promulgating water quality standards and issuing permits? Nothing in the preamble indicates that EPA views these criteria as merely advisory.

Despite stating that Executive order 12866 is not applicable, EPA goes on to include an economic analysis which purports to demonstrate that the proposed rule will result in a net economic benefit. The problem with this analysis is that it completely ignores the enormous cost that municipalities will bear if they are forced to bring their stormwater discharges into compliance with these toxics criteria. For example, a 1990 study conducted for the Sacramento Stormwater Program estimated that it would cost nearly $2 billion to implement a treatment program to achieve the water quality criteria proposed in the former Inland Surface Water Plan. Costs to comply with the proposed toxics criteria would be similar, if not higher, than those proposed in the Inland Surface Water Plan. Ultimately, the costs of compliance may reach into the ten of billions of dollars.

In short, EPA cannot have it both ways. It cannot state that stormwater discharges are subject to the proposed toxics rule and then turn a blind eye toward the costs associated with the implementation of this rule. The costs of the proposed rules are direct and significant, and therefore the rule must be submitted to OMB for review.

We have comparable concerns with the other federal laws that I cited previously, and we will elaborate on them in our written comments.

Response to: CTRH-002-006a

As with all NPDES storm water program rules, the CTR gives operators the flexibility to implement controls and measures as they deam appropriate to achieve the goals of the rule. MS4 operators can employ professional expertise, innovation or industry standards, and their previously-demonstrated legal authoriy (MS4 application, part 2 requirement) to achieve MEP (and to pay for it, if necessary), with the goal being cost-effective compliance with the CTR. WQS are considered in the CTR, as the rule allows the State to develop site-specific criteria when appropriate (see also the response to CTR-020-001 and

CTR-040-004).

Comment: SECTION 402(P) ONLY SUBJECTS MUNICIPAL SEPARATE STORM SEWER SYSTEMS TO MAXIMUM EXTENT PRACTICABLE ("MEP") LEVEL CONTROLS

The implementation approach adopted by the State and Regional Boards is compelled by Section 402(p) of the Clean Water Act, which directs that a distinction to be drawn between industrial and municipal dischargers, and subjects municipal systems only to those controls that reflect pollution reductions to the maximum extent practicable.

Section 402(p)(3)(A) of the Clean Water Act as amended in 1987 provides that:

Permits for discharges associated with industrial activity shall meet all applicable provisions of this section and section (301).

42 U.S.C. 1342(p)(3)(A) (Emphasis Added).

In contrast to Section 402(p)(3)(A), which makes industrial storm water sources subject to "section 301," Section 402(p)(3)(B) provides that MS4 discharges need only satisfy the dual requirements of: (1) effective prohibition of non-storm water discharges, and (2) controls to reduce the discharge of pollutants in storm water to the maximum extent practicable ("MEP"). 33 U.S.C. S 1342(p)(3)(B). That subsection contains no cross reference to Section 301 as is found in the industrial discharge provision.

Section 301(b)(1)(C) sets a "timetable for achievement of objectives" that directs "point sources" to achieve "any more stringent limitation, including those necessary to . . . implement any applicable water quality standard established pursuant to (the CWA (such as the CTR)]" by July 1, 1977. 42 U.S.C. S 1311(b)(1))(C). This section has been cited by EPA as a basis for imposing numeric effluent limitations exceeding MEP-level controls on municipal storm water systems.

Yet, until the addition of Section 402(p) in 1987, municipal storm water systems were not subject to a NPDES permitting requirement. To read Section 301(b)(1)(C) as applying to municipal storm water systems would necessitate the retroactive application of Section 402(p), since under that reading such systems would have been required to address water quality standards ten years before the provision was added to the Act.

An interpretation of the statute resulting in such retroactive application would be strongly disfavored in the absence of clear Congressional intent to establish such retroactivity. N.J. Singer, Sutherland on Statutory Construction, S 41.04 (Sands 5th ed. 1993) ("Sutherland") ("Retrospective operation is not

favored by the courts however, and a law will not be construed as retroactive unless the act clearly, by express language or necessary implication, indicates that the legislature intended a retroactive application.").

However, Section 402(p) avoids this problem by expressly describing the applicability of Section 301, distinguishing between industrial storm water sources (which were always subject to Sections 402 and 301 and are confirmed by the 1987 Amendments to remain subject to Section 301), and municipal storm water sources (which were not subject to Section 402 prior to the 1987 Amendments and are only subject to MEP-level controls). The applicability provisions of Section 402(p) are also accommodated directly in Section 301(b)(1)(C), which only requires the achievement of "applicable" water quality standards. (*3)

The express applicability provisions of Section 402(p) also eliminate any argument that Congress intended to make Section 402(p) retroactively applicable to municipal storm water systems, thereby requiring such systems to have achieved water quality standards ten years previously. Not only is evidence lacking of any Congressional intent to make the provision retroactive, any argument of such intent is definitively rebutted by the clear distinction in Section 402(p) between industrial and municipal storm water systems.

Under standard rules of statutory construction, the more specific provision (402(p)) prevails over the more general provision (301(b)), and the express reference to Section 301 for one category of dischargers (industrial) precludes implication of the same reference for another category of dischargers (municipal) that is specifically addressed and does not contain such a reference. (*4) In other words, while Section 402(p) arguably makes the water-quality-related provisions of Section 301 applicable to industrial discharges, the Clean Water Act establishes a distinct system for MS4s that relies on the prohibition of non-storm water discharges and escalating best management practices.

EPA in the preamble to its 1990 storm water regulations acknowledged the statutory distinction in stating that:

The Act clarified that permits for discharges associated with industrial activity must meet all of the applicable provisions of section 402 and section 301 including technology and water quality based standards. However, the new Act makes significant changes to the permit standards for discharges from municipal storm sewers . . . . The approach is tiered in that storm water discharges associated with industrial activity must comply with sections 301 and 402 of the CWA . . . but permits for discharges from municipal separate storm sewer systems must require controls to reduce the discharge of pollutants to the maximum extent practicable . . . .

55 Fed. Reg. 47992-94 (November 16, 1990).

It is therefore important that the CTR confirm the implementation provisions of the 1995 Basin Plan and corresponding State Board decisions, and conform to the distinction set forth in Section 402(p) of the Clean Water Act. There is no authority under the Act for subjecting municipal storm sewer systems to control obligations exceeding the MEP standard.

(*3) Section 301(a), by reference, also requires compliance with Section 302, which provides that where a discharge:

would interfere with the attainment or maintenance of that water quality in a specific portion of the

navigable waters which shall assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water, effluent limitations (including alternative effluent control strategies) for such point source or sources shall be established which can reasonably be expected to contribute to the attainment or maintenance of such water quality.

33 U.S.C. S 1312(a). Such "alternative effluent control strategies" which "can reasonably be expected to contribute" to this goal are generally comparable in description to the MEP standard.

(*4) In any event, Section 302 expressly allows "alternative effluent control strategies" and only requires limitations "reasonably" anticipated to "contribute" to meeting objectives. Similarly, EPA's regulations for the issuance of NPDES permits simply require the "imposition of conditions [that] ensure compliance with the applicable water quality requirements of all affected States.,, 40 C.F.R. S 122.4(d). For the San Francisco Bay Area, those requirements are expressed in the 1995 Basin Plan, which explicitly states that numerical water quality objectives are infeasible and provides for the sort of escalating management practices required under the NPDES permit for the ACCWP. The approach is also contemplated by EPA's regulations which state that NPDES permits should include " - . . best management practices to control or abate the discharge of pollutants when: . . . (2) Numeric effluent limitations are infeasible . . . . I, 40 C.F.R. S 122.44(k).

Response to: CTR-001-003

This comment is outside the scope of this rule which concerns what criteria should apply to California waters. The rule is distinct from the issue of whether storm water dischargers must comply with water quality standards. The issue raised by the commenter has been addressed by EPA's storm water program in other contexts. EPA disagrees with the comments. For a discussion of EPA's evaluation of studies concerning costs associated with achieving water quality criteria for storm water discharges, see responses to CTR-013-003 and CTR-040-004. For a discussion of the scientific validity of CTR criteria with regard to WQBELs and storm water discharges, see response to CTR-031-004c.

Comment: INCONSISTENT AND AMBIGUOUS LANGUAGE IN THE PREAMBLE SUGGESTING A DIFFERENT RESULT MUST BE REMOVED

Reaffirmation of the provisions in Section 402(p) that make municipal storm water systems subject only to MEP-level controls is critically important since a number of statements in the preamble are either expressly, or ambiguously, overbroad. For example, the preamble states that:

Point source and nonpoint source allocations are established so that predicted receiving water concentrations do not exceed water quality standards.

Page 42185. As discussed above, there is no authority in the Clean Water Act for imposing wasteload allocations on municipal storm water systems that require more than MEP-level controls. Likewise, the following statement could be read to impermissibly substitute numeric effluent limitations for the MEP control standard:

National Pollutant Discharge Elimination System (NPDES) permits for wet weather point source discharges must include limits necessary to implement applicable water quality standards, through application of water quality-based effluent limitations of WQBELS.

Page 42186. Other statements in the preamble are somewhat less direct but nonetheless problematic.

When these proposed federal criteria take effect, they will create legally applicable water quality standards in the State of California for inland surface waters, enclosed bays and estuaries for all purposes and programs under the CWA.

Page 42160. Similarly, the following statement at page 42162 could be read in an overbroad manner as applied to MS4 discharges:

CWA section 301(b)(1)(C) . . . requires NPDES permits to contain limitations required to implement any applicable water quality standard established in the CWA.

So long as this "implementation" occurs through adoption of MEP-level BMPs, the result may be correct, but it is correct only because 402(p) subjects MS4s to the MEP standard, rather than due to the provisions of Section 301(b)(1)(C), which only apply to industrial and not municipal storm water systems under the applicability scheme established in Section 402(p).

Likewise, the apparently broad statement at page 42184 that:

If a discharge causes, has the reasonable potential to cause, or contributes to an excursion of a numeric or narrative water quality criteria, the permitting authority must develop permit limits as necessary to meet water quality standards.

must be qualified as applied to MS4s by the distinction set forth by Congress in Section 402(p). From the same statutory language of Section 402(p) comes the corollary that wasteload allocations reflecting reductions beyond MEP do not apply to municipal storm water discharges. (*6)

Any attempt to subject MS4s to controls exceeding the MEP standard would be unauthorized, and the statements in the preamble suggesting such a result must be removed. (*7)

(*6) The limited time allowed by the proposed rule for compliance schedules also does not adequately accommodate the MEP standard, since it may not be practicable (or even possible) to meet NELs or WLAs within the deadlines allowed under the proposal. The rule should allow compliance schedules for as long as necessary to meet the requirements using MEP-level controls.

We note in this regard that the proposed State Implementation Policy would provide that:

In no event shall a schedule of compliance for point source discharges, including stormwater discharges, exceed 10 years from the date of adoption of this Policy.

Draft SIP at 17. This provision would violate both Section 402(p) of the Clean Water Act and the cost-benefit balancing provisions of the Porter Cologne Act discussed below, to the extent that compliance within ten years could not be achieved through MEP-level controls.

(*7) We recognize that there is useful language in the discussion of "Wet Weather Flows" at page 42186-87, which states:

EPA recognizes that it is commonly infeasible to express (water quality based effluent limitations or] WQBELs as numeric limits for wet weather discharges and that in such cases best management practices ("BMPs") may serve as WQBELs . . . . It is therefore anticipated that WQBELS, including those necessary to meet the criteria set forth in this proposed rule, will be expressed as BMPs in wet weather discharges, NPDES permits, when the permitting authority determines that it is infeasible to express WQBELS as numeric limits.

We agree that MS4 permits should be established on the basis of BMPS. But EPA's discussion at page 42187 still fails to implement Section 402(p) to the extent that the agency would evaluate the feasibility of "expressing" numeric WQBELS rather than "satisfying" or "meeting" WQBELS. Section 402(p) only requires MS4s to adopt controls to the MEP level. It is the practicability of controls that is central to this system, not just the practicability of writing permits. The discussion at page 42187 should therefore be modified to acknowledge directly that MS4s are only required under Section 402(p) to adopt MEP level controls, regardless of whether it would be "feasible" from an administrative standpoint to write permits containing NELs or WLAS.

Comment: CONCLUSION

The most fundamental concern of the ACCWP is that any decision to subject MS4 dischargers to numeric effluent limitations and/or wasteload allocations that could trigger extensive collection and

end-of-pipe treatment facilities should take place directly and openly, rather than implicitly through ambiguously drafted regulation and preamble discussion. The ACCWP believes that it is currently in full compliance with its Clean Water Act obligations, through the adoption and implementation of a Storm Water Management Plan that has won numerous awards.

Only controls to the maximum extent practicable are required under Clean Water Act Section 402(p), and the State and Regional Boards are likewise precluded from adopting draconian control measures under analogous limitations of the state Porter Cologne Act.

These are not just nettlesome roadblocks to EPA action, but instead reflect a considered determination made by the legislative branch of both the state and federal governments that resources need only be devoted to this subject to the extent practicable. Given the magnitude of the public expenditures that would be involved statewide from numeric effluent limitations and/or reductions to meet wasteload allocations more stringent than achievable from MEP-level controls, and the fact that Congress has already addressed the matter in Section 402(p), a decision of this type and magnitude cannot be made administratively.

If EPA's intention is to conform its rule to Section 402(p), it should do so clearly and cleanly and remove the conflicting statements in the proposed rule's preamble that suggest a different result.

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

1. The application of water quality standards to calculate water quality-based effluent limits for NPDES permits for municipal stormwater discharges. As proposed by the USEPA, the numeric water quality standards in the California Toxics Rule will be used to calculate water quality-based effluent limitations for all NPDES permits issued by the State. With regard to stormwater permits, the USEPA states in the preamble that:

NPDES permits for wet weather point source discharge must include limits necessary to implement applicable water quality based standards, through application of water quality-based effluent limitations or WQBELS. When this rulemaking is complete, these (numeric) criteria will be used to determine water quality standards in California and will, therefore, be the basis of WQBELs in NPDES permits for wet weather point sources. (Page 42186)

We believe that this position is inconsistent with the plain language used by Congress in incorporating the "maximum extent practicable" standard for municipal separate storm sewer systems (MS4s) into Section 410(p) (3) (B) of the Clean Water Act. To date, we are unaware of any USEPA regulation which has taken the noted position.

The Preamble goes on to state: "It is ... anticipated that WQBELS, including those necessary to meet the criteria set forth in this proposed rule, will be expressed as BMPs in wet weather discharges' NPDES permits, when the permitting authorities determines that it is infeasible to express WQBELs as numeric limits." Although this statement is intended to soften the earlier position, the difficulty for municipalities is that even with an aggressive BMP-based program, a municipality will likely not be able to comply with the proposed water quality standards. This was found in the analysis conducted by the County of Sacramento and the Fresno Metropolitan Flood Control District. If this is the case, the permitting agency would be required to develop a permit with WQBELs that essentially require end-of-pipe treatment of stormwater and the municipalities would face significant costs for complying with the limits.

We recommend that the USEPA modify the Preamble to clarify that MS4s are not required to comply with water quality standards.

Comment: We recognize that the basic purpose for the proposed rule is to establish water quality criteria for priority toxic pollutants for point source discharges. However, in proposing to extend that criteria to storm water discharges, it is clear that EPA has not fully assessed the potential impact of such an extension on local governmental agencies, nor the complete lack of feasibility of attempting to apply numeric effluent standards to discharges to municipal separate storm sewer systems ("MS4s"), or the enormous cost of such an effort which would potentially require a complete reengineering and if not reconstruction of MS4s in California to include end-of-pipe treatment.

Our comments should be considered in the proper context. The cities which we represent are acutely aware of the problems associated with pollution from... urban runoff. Their residents and businesses share a common concern to preserve and enhance the water quality of our bays, rivers, estuaries and the Pacific Ocean. Our cities are fully committed to doing what they reasonably can to achieve these objectives. Our cities have been working with staff of the State Water Resources Control Board ("SWRCB") and its Regional Water Quality Control Boards ("RWQCB's") to develop effective storm water management programs under current municipal NPDES permits which comply with state and federal law. However, the proposed rule does not appear to reflect or recognize that individual cities' fiscal and administrative resources for implementing unfunded mandates are limited. Of all governmental agencies in California involved in the process, the many small cities which we represent are the least suited to bear the brunt of the responsibility for controlling pollution from urban runoff.

The primary portion of the proposed rule that has caused concern among our cities is the statement at

pages 42186-42187 of preamble that:

"When this rulemaking is complete, these criteria will be used to determine water-quality standards in California and will therefore be the basis of WQBELs in NPDES permits for wet weather point sources. However, EPA recognizes that it is commonly infeasible to express WQBELs as numeric limits for wet weather discharges and that in such cases best management practices ("BMPs") may serve as WQBELS. (Emphasis added.)

Our concern is further heightened by the comment at page 42187 of preamble that:

"It is therefore anticipated that WQBELS, including those necessary to meet the criteria set forth in this proposed rule, will be expressed as BMPs in wet weather dischargers' NPDES permits, when the permitting authority determines that it is infeasible to express WQBELS as numeric limits." (Emphasis added.)

The comments appear to indicate that in any further municipal NPDES permitting situations, the proposed rule potentially can be interpreted to require the implementation of WQBELs unless an analysis is prepared determining the infeasibility of each of the WQBELs as numeric limits.

As applied to storm water discharges, WQBELs are almost by definition infeasible. It should also be kept in mind that it is not the cities themselves that are the sources of stormwater pollution; municipal facilities have not been identified, to our knowledge, as being significant sources of contaminated urban runoff. Rather, the sources of this type of pollution, to the extent they can be identified, appear to be primarily the result of hydrological changes brought about by urbanization. These are activities over which cities have very little practical control. Nevertheless, the cities and counties of California are bearing the full and financially unassisted responsibility of ending stormwater pollution themselves.

We agree with the comments of the County of Los Angeles and the ACCWP that EPA's effort to apply numeric effluent limits to municipal storm water discharges is in direct conflict with the plain language of Congress in adopting the "maximum extent practicable" standard for controlling pollution in storm water discharges to a MS4. The proposed rule as applied to wet weather flows is also clearly inconsistent with both the EPA Is and the SWRCB's approach of addressing this problems through the adoption of Best Management Practices ("BMP's").

As noted in the SWRCB's own Municipal Storm Water Best Management and Practices Guidebook, "the sources of storm water pollution are extensive, ill-defined and highly variable." The State Board previously determined in its order entitled "In the Matter of Petition of Natural Resources Defense Council, Inc. for Review of Waste Discharge Requirements Order No. 90-079," Order No. WQ 91-04 (May 16, 1991), that:

"We find here also that the approach of the Regional Board requiring the dischargers to implement a program of best management practices which will reduce pollutants and runoff and prohibiting non-storm water discharges, is appropriate and proper. We base our conclusion on the difficulty of establishing numeric effluent limitations which have a rational basis, the lack of technology available to treat storm water discharges at the end of the pipe, the huge expense such treatment would entail, and the level of pollutant reduction which we anticipate from the Board's regulatory program. We feel compelled to note here our agreement with the Regional Board that this permit does truly represent a massive undertaking." (Emphasis added.)

As discussed in detail in the technical comments filed in response to the proposed rule, the EPA has not

explained how the proposed numeric effluent guidelines can be achieved through the implementation of BMP's. Under the circumstances, the ultimate result of the application of the rule to storm water discharges would be end of pipe treatment controls.

However, the EPA has already recognized, as the SWRCB, that end of pipe treatment controls for storm water discharges are technically unfeasible and unreasonable. The EPA has recognized that "it was not the intent of Congress to acquire municipal permits to required end of pipe treatment technology but to implement a comprehensive stormwater management program to reduce the discharge of pollutants from municipal storm sewer systems." 55 Fed.Reg., p. 48038 (November 16, 1990).

Each of our cities strongly believe that the proposed rule must be modified to clearly state that numeric effluent guidelines do not and will not apply to discharges to the municipal separate sewer systems.

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and with an expectation that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit and with the same expectation, Sunnyvale would like to make the following points on its own behalf:

3. Failure to Address Important Stormwater-Related Issues. In addition to its POTW, Sunnyvale is the owner of a system of storm drains which contribute wet weather flows to the South Bay. We are concerned that the EA entirely neglects the potential impacts of the proposed CTR on the storm drains. The EA entirely omits any meaningful analysis of the costs of bringing storm drains into compliance with the proposed CTR, thereby significantly understating the overall costs of the CTR. We believe that this omission is violative of the Agency's legal obligations under the authorities cited in the preceding paragraph.

In addition, we join in the comments being filed by the various other operators of stormwater collection systems to the effect that EPA has overstated the legal requirements for storm drains to comply with numerical criteria.

Response to: CTR-021-006e

EPA disagrees with the comments. See response to CTR-001-003. Comment: MAJOR ISSUES

1. The application of water quality standards to calculate water quality-based effluent limits for NPDES permits for municipal stormwater discharges. In the preamble to the proposed rule, US EPA suggests that the numeric water quality standards in the CTR will be used to calculate water quality-based effluent limitations for all NPDES permits issued by the State. With regard to stormwater permits, USEPA states in the preamble that:

NPDES permits for wet weather point source discharge must include limits necessary to implement applicable water quality based standards, through application of water quality-based effluent limitations or WQBELS. When this rulemaking is complete, these (numeric) criteria will be used to determine water quality standards in California and will therefore be the basis of WQBELs in NPDES permits for wet weather point sources. (Page 42186)

We believe that this position is inconsistent with the plain language used by Congress in incorporating the "maximum extent practicable" standard for municipal separate storm sewers systems (MS4s) into section 420(p)(3)(B) of the Clean Water Act. To date we are unaware of any USEPA regulation, which has taken the position in the proposed rule. Furthermore, the basis for USEPA's position is primarily the "Elliot memo". This memo is an internal memorandum and has not been subject to public or judicial review. Further discussion regarding this issue is found in the responses to the CTR by the Alameda Countywide Clean Water Program, County of Orange and County of Sacramento, which are incorporated herein by reference.

The Preamble goes on to state: "It is ....anticipated that WQBELS, including those necessary to meet the criteria set forth in this proposed rule, will be expressed as BMPs in wet weather discharges' NPDES permits, when the permitting authority determines that it is infeasible to express WQBELs as numeric limits." Although this statement appears to soften the earlier position, the difficulty for municipalities is that even with an aggressive BMP based program, a municipality will likely not be able to comply with the proposed water quality standards. We point to the analysis conducted by the County of Sacramento and the Fresno Metropolitan Flood Control District. If this is the case, the permitting agency could likely be required to develop a permit with WQBELs that essentially require end-of-pipe treatment of stormwater and the municipalities would face significant costs for complying with the limits (see following discussion regarding economic analysis).

Recommendation: USEPA should modify the Preamble statement to clarify that MS4s are only required to satisfy the MEP standard, and are not obligated to adopt controls beyond MEP-levels to achieve water quality standards.

Response to: CTR-027-001

Comment: F. EPA Should Provide a Consistent Standard for Application of BMPs to Wet Weather Flows

UWAG applauds EPA's recognition that "it is commonly infeasible to express WQBELs as numeric limits for wet weather discharges and that in such cases best management practices (BMPS) may serve as WQBELS." 62 Fed. Reg. at 42, 186-87. But EPA also obscures the standard for determining when use of BMPs is appropriate by stating:

It is ... anticipated that WQBELS, including those necessary to meet the criteria set forth in this proposed rule, will be expressed as BMPs in wet weather discharges' NPDES permits, when the permitting authority determines that it is infeasible to express WQBELs as numeric limits.

62 Fed. Reg. at 42,187, col. 1. This statement differs from the standard EPA proposed in a recently released question and answer document (61 Fed. Reg. 57,425 (Nov. 6, 1996)) on wet weather flows. According to the question and answer document, permitting authorities may use alternative permit conditions "where numeric water quality-based effluent limitations are determined to be unnecessary or infeasible." Id. at 57,426, col. I (emphasis added). Thus, EPA has narrowed the applicability of BMPs to wet weather flows for purposes of the California proposal. If EPA wants to promote consistent treatment of wet weather flows, it should modify the proposed preamble to the California water quality standards to reflect that the permitting authority may apply BMPs or other alternative permit conditions whenever a numeric WQBEL is unnecessary or infeasible.

Furthermore, EPA should explicitly state that the permitting authority bears the burden of showing that a numeric WQBEL for a wet weather flow is feasible or necessary. Since EPA admits that such limitations are "commonly infeasible," the permittee should not bear the burden of proving numeric limits unnecessary or infeasible.

Response to: CTR-030-010

EPA disagrees with the comments. See response to CTR-001-003. Comment: 1. The preamble of the proposed CTR, and therefore the apparent intended application of the rule, is inconsistent with the Clean Water Act.

Several broad, ambiguous statements in the preamble of the proposed rule imply that Clean Water Act section 301 requirements apply to all dischargers, including municipal stormwater systems. These presumptions must be qualified to recognize the clear intent of Congress and plain language of the CWA, section 402(p) which clearly require municipal storm water dischargers only to adopt controls to reduce pollutants in storm water to- the maximum extent practicable and to eliminate non-storm water discharges. The section's intent is demonstrated through the application of section 301 requirements, and related application of numeric effluent limitations or wasteload allocations in NPDES permits, to industrial stormwater discharges only.

EPA is obviously aware of Congress's intent as to municipal storm water discharge requirements. EPA included in its published draft Phase I municipal storm water regulations a quote from the Congressional Record of October 16, 1986, citing that intent.

Without a clear citation of the provisions of CWA section 402(p), the preamble to the proposed rule appears to be an attempt to codify the Elliot memorandum of January 9, 1991, and to create via this rule a result not authorized by Congress.

In order to eliminate this fundamental legal flaw in the proposed CTR, and eliminate the potential for future misinterpretation and controversy, each of the following statements from the preamble (at a minimum) must be clarified and/or qualified so that they do not appear to override or retract CWA section 402(p).

"When these proposed federal criteria take effect, they will create legally applicable water quality standards ... in California ... for all purposes and programs under the CWA." [p. 42160. This statement must include recognition that for municipal storm water dischargers, the CWA objectives can be addressed through best management practices, implemented to the maximum extent practicable (MEP), as established by CWA section 402(p).]

"CWA section 301(b)(1)(C) ... requires NPDES permits to contain limitations required to implement any applicable water quality standard established in the CWA." [p. 42162. The text should note that section 301 (b) (1) (c) does not apply to municipal storm water dischargers, as established through section 402(p).]

"If a discharge causes, has the reasonable potential to cause, or contributes to an excursion of a numeric

or narrative water quality criteria, the permitting authority must develop permit limits as necessary to meet water quality standards." (P. 42184. Again, for municipal storm water dischargers, the preamble and CTR must make clear the MS4 permits must: address this CWA objective through the MEP requirement.]

"Point source and nonpoint source allocations are established so that predicted receiving water concentrations do not exceed water quality standards." [p. 42185.1; and

"[NPDES] permits for wet weather point source dischargers must include limits necessary to implement applicable water quality standards, through application of water quality-based effluent limitations or WQBELs." [p. 42186. These two statements are only correct as applied to industrial storm water dischargers; numeric effluent limitations or wasteload allocations can not be legally, reasonably, or practically applied to municipal storm water discharges.]

Comment: pp. 42186-42187 -- Wet Weather Flows Consistent with a recommendation by the Permitting and Compliance Issues Task Force, we recommend that EPA include language in the Preamble stating that, for permits such as stormwater permits that do not generally contain quantitative effluent limits but instead require the implementation of control measures and best management practices, compliance shall be determined based on the degree of implementation of the required control measures and the reduction of pollutants to the maximum extent practicable (SWRCB, 1995, Part VI).

Comment: Applicability of Criteria to Municipal Stormwater Discharges

In the preamble to the proposed rule, EPA assumes without discussion that these criteria for priority toxic pollutants apply to municipal stormwater discharges. Specifically, the preamble states, "When this rulemaking is complete, these criteria will be used to determine water quality standards in California and will therefore be the basis of WQBELs [Water Quality-Based Effluent Limitations] in NPDES permits for wet weather point sources." [62 Fed. Reg. 431861.

We note for the record, however, that the applicability of WQBELs to municipal stormwater discharges is an issue which has not yet been resolved. Under Section 402(p)(3)(A) of the Clean Water Act ("CWA"), permits for industrial stormwater discharges must comply with the applicable provisions of the CWA concerning effluent limitations. [33 U.S.C. section 1342(p)(3)(A)]. In contrast, permits for municipal Stormwater discharges are only required to ensure reduction of the pollutant discharges "to the maximum extent possible." [33 U.S.C. section 1342(p)(3)(B)].

In the preamble, EPA acknowledges that it is "commonly infeasible" to express WQBELs as numeric limits for wet weather discharges and that in such cases best management practices (BMPs) "may serve as WQBELS." [62 Fed. Reg. 42186-871.] Implicit in that acknowledgment is the assumption that the application of WQBELs to municipal stormwater discharges remains appropriate and that numeric limits can be imposed on such discharges at some time in the future. We believe such an assumption is wrong and is directly contradicted by the plain language of Section 402(p). The distinction drawn between industrial stormwater discharges and municipal stormwater discharges under that Section are real and cannot be ignored by EPA in adopting the proposed rule.

Conclusions

The proposed California Toxics Rule in its current form has many flaws, with respect to its presumption of applicability to municipal stormwater discharges. The comments provided above indicate a need to substantially revise the rule and assure conformance with federal policies and laws. Consideration should also be given to allowing the State of California to resume control over rule promulgation. As a result, the County of Orange recommends that the rule not be adopted at this time and that discussions be initiated with municipal stormwater dischargers through the California Stormwater Task Force to resolve the many issues raised.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

1. Concern: The Rule, as presently proposed, appears to require discharges from municipal stormwater programs to meet water quality based effluent limits (WQBELs).

* Reference Section--Preamble, page 42186 of the Federal Register under "4. Wet Weather Flows." This language appears to replace the municipal stormwater BMP standard established in the Clean Water Act (CWA) section 402(p)(3)(B), that municipal stormwater programs "shall require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP)..."

* Many of the urban streams in Sacramento County are effluent dominated during storm events. Thus, the flow in these urban streams is primarily stormwater. if WQBELs apply to municipal stormwater, then stormwater discharges to many county urban streams will have to meet the numeric water quality criteria proposed in the Rule.

* If the Rule intends that municipal stormwater discharges will be required to meet WQBELS, the Rule will force the Sacramento Stormwater Management Program to implement end-of-pipe treatment.

Response to: CTR-040-003

EPA disagrees with the comments. See response to CTR-001-003. Comment: The California Department of Transportation (Caltrans) submits the following comments on the proposed California Toxics Rule ("CTR") relative to its status as a NPDES storm water discharge permit holder. As this proposed rule could have serious financial impacts on storm water dischargers, Caltrans welcomes the opportunity to provide comments to EPA that could decrease the impact of this rule while still affording a similar level of environmental benefit. It is our hope that you will give serious consideration to the following comments:

1. The CTR improperly applies water quality-based effluent limits to municipal storm water discharges.

The Preamble to the CTR discusses application of the rule to wet weather discharges by stating:

NPDES permits for wet weather point source discharges must include limits necessary to implement applicable water quality standards, through the application of water quality-based effluent limitations or WQBELS. Section 301(b)(1)(C) of the CWA, 33 U.S.C. 1311(b)(1)(C); see also Memorandum of E. Donald Elliot, Assistant Administrator and General Counsel, to Nancy J. Marvel, Region 9, dated January 9, 1991. When this rulemaking is complete, these criteria will be used to determine water quality standards in California and will therefore be the basis for WQBELs in NPDES permits for wet weather point sources.

62 Fed. Reg. 42,186 (Aug. 5, 1997). The position taken by EPA in this excerpt, namely that WQBELs must be applied to all wet weather discharges, is inconsistent with the plain language of the Clean Water Act ("CWA"). The CWA at section 402(p)(3)(B)(iii) specifically states that permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable." Unlike industrial storm water dischargers, which are required to "meet all applicable provisions of this section and section 1311 of this title" (See section 402(p)(3)(A)), municipal storm water dischargers, such as Caltrans, must only reduce the discharge of pollutants to the Maximum Extent Practicable ("MEP"). The Preamble language mistakenly applies the WQBEL requirements of section 301 to municipal storm water dischargers when it is clear that Congress never intended for municipal dischargers to meet this more stringent standard.

Request: Caltrans respectfully requests that the Preamble be modified to clarify that municipal storm water discharges are not required to meet water quality standards, but must only control discharges to the MEP.

Response to: CTR-042-001

Comment: Third, regarding the criteria being proposed for adoption in the draft CTR, EBMUD recommends that EPA should:

* Should clearly recognize within the CTR that the existing, approved Basin Plan for the San Francisco Bay includes requirements specifically designed to address wet weather overflows and grants provisions for exemptions where an inordinate burden would be placed on the discharger relative to the beneficial uses protected. It should also be acknowledged through inclusion in the CTR that the requirements and applicable exemptions previously justified and approved by EPA and the State should not be affected by the proposed rule.

Response to: CTR-056-015a

The purpose of the CTR is to fill the current gaps in water quality criteria in inland surface waters, enclosed bays, and estuaries. Any existing exemptions in a State Basin Plan that have been approved by the State and EPA would not be negated by the CTR.

Comment: PROVISIONS SDG&E DOES NOT SUPPORT

As described in the following comments SDG&E does not support the following provisions:

Application of effluent limits/BMPs to stormwater

The preamble (see 62 Fed. Reg. at 42,186, Col. 3) states that: 1) NPDES permits "...for wet weather point source discharges must include limits necessary to implement applicable water quality standards,

through application of water quality-based effluent limits or WQBELs"; and 2) "...these criteria will ... be the basis of WQBELs in NPDES permits for wet weather point sources". The preamble further recognizes that "it is commonly infeasible to express WQBELs as numeric limits for wet weather discharges and that in such cases best management practices (BMPS) may serve as WQBELS." (see 62 Fed. Reg. at 42,186-87). However, the standard for determining when the use of BMPs is appropriate is different from that provided in a recent Federal Register notice (see 61 Fed. Reg. 57425-29) "Questions and Answers Regarding Implementation of an Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits" (the "Notice"). Whereas the Notice states that permitting authorities may use alternative permit conditions "where numeric water quality-based effluent limitations are determined to be unnecessary or infeasible." Id. at 57,426, col. 1 (emphasis added), the preamble to the CTR indicates that BMPs may only be used where it is determined that "...it is infeasible to express WQBELs as numeric limits."

EPA should revise the preamble to the CTR to state that BMPs or other alternative permit conditions may be utilized whenever a numeric WQBEL is unnecessary or infeasible.

Furthermore, EPA should explicitly state that the permitting authority bears the burden of showing that a numeric WQBEL for a wet weather flow is feasible or necessary. Since EPA admits that such limitations are "commonly infeasible," the permittee should not bear the burden of proving numeric limits unnecessary or infeasible.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our stormwater program:

1 . The application of water quality standards to calculate water quality-based effluent limits for NPDES permits for municipal stormwater discharges. As proposed by the U.S. EPA, the numeric water quality standards in the California Toxics Rule will be used to calculate water quality-based effluent limitations for all NPDES permits issued by the State. We believe that this position is inconsistent with the plain language used by Congress in incorporating the "maximum extent practicable" standard for municipal separate storm sewer systems (MS4s) into section 41 0 (p) (3) (B) of the Clean Water Act. We

recommend that the U.S. EPA modify the Preamble to clarify that MS4s are not required to comply with water quality standards.

Comment: Members of the SCVURPPP strongly endorse and fully incorporate by this reference, the comments being submitted to you on the California Toxics Rule ("CTR") by the State Storm Water Quality Task Force, the Alameda Countywide Clean Water Program, and other municipal stormwater programs located throughout California. As those comments make clear at greater length, Congress's directive in Clean Water Act section 402(p)(3)(B) requires that the Agency expressly exclude municipal stormwater permits from the scope of proposed section 131.38(e)(1). Specifically, this section of the rule should be modified to state: "It is presumed that new and existing point source dischargers except for municipal stormwater dischargers, will promptly comply with any new or more restrictive water quality-based effluent limitations ("WQBELs") based on the water quality criteria set forth in this [rule]."

As other commenters have made clear, the Agency's current position in the CTR's preamble which "presumes" that municipal stormwater discharges are subject to water quality-based effluent limitations ("WQBELs") flies in the face of the plain language used by Congress in enacting section 402(p)(3)(B) of the Clean Water Act. It also ignores the contrast that Congress drew in the statute between the NPDES permitting requirements specifically delineated for municipal stormwater discharges and those expressly made applicable to stormwater discharges "associated with industrial activities." cf. 33 U.S.C. 1342(p)(3)(B) with 33 U.S.C. 1342(p)(3)(A). While best management practices ("BOPS") are certainly more appropriate tools for permit writers to use in stormwater permits than numeric effluent limitations, when it comes to municipal stormwater permits, Congress clearly required that such permit requirements be derived from section 402(p)(3)(B)(iii)'s maximum extent practicable standard, not through WQBELs based on the type of numeric water quality standards being promulgated in the CTR.

Response to: CTR-087-001

EPA disagrees with the comments. See response to CTR-001-003. Comment: Impacted Facilities - p 42160. Potentially Affected Facilities--- This list should include separate storm water systems and combined sewer systems in addition to POTWS. The preamble is vague as to whether these facilities must eventually comply with water quality criteria. If municipal wet-weather discharges must comply with strict application of the CTR, the potential infrastructure costs of compliance for metropolitan areas will be considerable. San Francisco spent $1 billion to address wet weather pollution. Assuming comparable per capita costs ($1,300 pc), and an urbanized population of 25,000,000 in California, wet weather capital costs could run over $32,000,000,000. Annual amortization costs (I = 5%) would exceed, $2,500,000,000. Even if only 5% of urbanized areas needed to use structural solutions for wet weather discharges, annual costs would be in the order of $125,000,000. It is essential that EPA decide whether it expects wet weather discharges to comply with the numerical standards and then state this assumption explicitly. EPA is doing a disservice to the public ff it maintains this dichotomy in the document: (1) an assumption in its economic analysis that storm water will not need substantial controls to meet the requirements of the rule-making, and (2) the position that this rule-making will promote the attainment of those designated uses adopted by the state.

Comment: Application of Rule to Municipal Stormwater Dischargers

The CTR does not clearly state how the establishment of these criteria is intended to be implemented to municipal stormwater dischargers. The City opposes to any scenario that would directly apply numerical water quality objectives to this permitted program. The Rule needs to be revised to clearly state that the criteria established by the rule will not be used to calculate numeric water quality based effluent limitations for municipal storm water dischargers.

If the Rule were to result in the imposition of numeric water quality based effluent limitations on municipal storm water dischargers, it would be inconsistent with the plain language used by Congress in incorporating the "maximum extent practicable" standard into Section 402(p)(3)(B) of the Clean Water Act. Revision of the Rule to clearly state that it will not result in the imposition of numeric water quality based effluent limits on the Municipal storm water dischargers is also necessary to conform the rule with EPA's Economic Analysis, which assumes that the Rule will have no economic impact on these dischargers. EPA's failure to assess the costs of bringing municipal storm water dischargers into compliance with numeric water quality based effluent limits would represent a substantial violation of its legal requirements under Executive Order 12866, the Unfunded Mandates Reform Act of 1995 (2 U.S.C.A. 1511 et seq.), and the Regulatory Flexibility Act (5 U.S.C.A. 601 et seq.).

Specific areas of the Rule that need to be revised to clarify application of the rule to municipal storm water dischargers are Section F4 of the preamble, relating to wet weather flows and Section 131.38(e)(1). The discussion of the "unfeasibility" of imposing numeric limits for wet weather dischargers in the preamble is not an adequate statement that numeric limits will not be imposed. Moreover, the Rule itself states that it "presumed" that new and existing point source dischargers will promptly comply with any new or more restrictive water quality based effluent limits based on the water quality criteria set forth in this section. In order to be consistent with the Economic analysis, the Rule should explicitly state that it can only be used to establish BMP's as WQBEL's for municipal stormwater dischargers.

Comment: As you heard from speaker after speaker yesterday, the urban stormwater dischargers are justifiably concerned about the confusing situation that exists today where they are being informed by the US EPA that NPDES-permitted urban stormwater runoff will be subject to having to meet water quality standards (objectives) in the receiving waters for the stormwater runoff during the time of runoff and after through a process of ever-increasingly more stringent and expensive BMPS. As I testified at the hearing and as is well understood in the field, the US EPA "Gold Book" water quality criteria, including those being promulgated under the California Toxics Rule, were not designed to address short-term, episodic events of the type that routinely occur in stormwater runoff from urban areas and highways. As a result, administrative exceedances of the California Toxics Rule criteria can readily occur without any real impairment of the designated beneficial uses for the receiving waters for the stormwater runoff. By real impairment I mean an altered number, types and/or characteristics of aquatic life in the receiving waters for the runoff.

There have been a sufficient number of studies conducted now to document that it will indeed be rare that the constituents which occur in urban stormwater runoff from residential and commercial areas are in toxic, available forms for a sufficient duration in the receiving waters for the ninoff to be adverse to aquatic life. As long as the US EPA persists with its improperly developed and adopted Independent Applicability policy, where chemical criteria/standards have to be met, even if appropriately conducted studies show that the constituents of concern such as heavy metals in urban stormwater runoff, are in non-toxic, non-available forms, the urban stormwater dischargers face the situation of ultimately having to spend large amounts of public funds to achieve administrative exceedances of inappropriate criteria/standards for urban stormwater runoff with no expected improvement in the real beneficial uses of waterbodies in which the exceedances occur that are of concern to the public who must ultimately pay for the control programs.

The administrative exceedances arise from well-known, technically invalid, inappropriate approaches that were adopted by the US EPA in the 1980s for implementing the "Gold Book" criteria that the Agency under various administrations has yet to address. Even today, based on discussions at the US EPA's Multi-Regional Water Quality Criteria and Standards meeting that was held at the end of August 1997 in St. Louis, Missouri, the Agency is still unwilling to address in a meaningful way the problems in regulating urban stormwater runoff water quality. For the Agency to announce, as it did at this meeting, that wet weather issues are no longer part of the ANPRM represents a serious deficiency in the Agency's current policy that must be corrected.

Response to: CTRE-002-002

EPA disagrees with the comments. The ANPRM and the scope of section 402(p) are outside the scope of the rule. See response to CTR-001-003. For a discussion of the scientific validity of CTR criteria, see response to CTR-031-004c. Comment: MR. HALE: Good afternoon. My name is Robert Hale and I'm the chairman of the California Stormwater Quality Task Force which is located at 951 Turner Court, Suite 300, in Hayward.

This task force is a statewide organization representing municipal separate storm sewer systems that hold National Pollutant Discharge Elimination System, NPDES, permits to discharge stormwater.

My comments today are on behalf of the -- principally on behalf of that task force. I also am chairman of the management committee of the Alameda Countywide Clean Water Program. I will make some comments with respect to Alameda County.

As proposed by EPA, the preamble language, which is the principal point here in referring to numeric effluent limitations and water quality based effluent limitations, is clearly inconsistent with the plain language used by Congress in incorporating the maximum extent practicable standard into Section 402(p)(3)(B) of the Clean Water Act.

You may argue that this reference is only in the preamble and not in the main text of the rule; but it's my understanding, however, that the preamble itself is supposed to explain and clarify the meaning of the rule and the Clean Water Act. This proposed language would instead appear to be trying to change one of the fundamental points of the Clean Water Act.

The reason I think this point is fundamental is that the cost to society, and to our county in this case and to the states, is an important consideration. Congress considers the entirety of the tasks that the country has to do, rather than going for broke on one issue such as stormwater quality.

In short, the Congress balances the larger picture, and the language in Section 402(p)(3)(B) actually reflects that balance. I believe that Section 402(p) says what it says for a good reason. The only economically feasible means of achieving water quality standards is through best management practices.

To illustrate this point, I work in Alameda County as chairman of the Clean Water Program there, and I did some rough calculations here. We often get storms as much as 2 inches in a 24-hour period. That's several times a winter. If you had a one-day storm, as I figure it, that will work out to 5 billion gallons of runoff water.

To treat this much water, if we were driven to this sort of the extreme case by the language in the preamble -- and I'm not talking about the text of the rule so much as the language in that preamble -- if it were to drive us in this extreme case to have -- to do end-of-pipe treatment for our discharges in order to meet the standards that are there, and to keep up -- basically keep up with the storms, which often come one behind the other within a couple days, it would necessitate building dozens, perhaps more, treatment plants of substantial size and would necessitate the use or acquisition of valuable industrial properties on the margins of the bay. Which I just did a little separate figuring here; I'm figuring it costs about $3 a gallon to treat -- to secondarily treat sanitary sewage and about $4 a gallon to store it.

I estimate that a storm of this size -- to be able to handle a storm of this size would cost between 35 and $50 billion for Alameda County alone. This is for a population of l.35 million residents.

And this does not account for the acquisition of property needed to do this, assuming we could store it in facilities or properties we already own. And it also does not account for the secondary treatment. In fact, we might have some difficulty achieving the standards that are in the rule.

And there's a way you can express this getting down to the nuts and bolts of it, which I like to do. I did some rough estimates of the size of the Oakland Coliseum, and if you were to use structures the size of the Oakland Coliseum for storing this water from one of these storms, I figured it would come out to -- you'd need 50 of them to store the runoff from this one storm that I've got here.

And I know some of you might be thinking about how the A's are doing right now and this might not be a bad idea. We can, say, think about leaving an extra one there for the A's and Raiders and build 50 more of them.

But the point is, we're talking about a tremendous investment in the infrastructure here, and it's very difficult for us to keep up with.

So let's see. Just a few more points here.

So we're not really talking about upgrades to existing delivery and treatment systems. We would have to start from scratch and build pumping systems, conveyance systems, to build an entire infrastructure. The cost would be prohibitive for us in Alameda County. This is a -- sort of one of the worst-case scenarios. And I think that the economic rule -- or the economic analysis in the rule doesn't do this justice.

So --

MR. MORRIS: Have you done any modelling?

MR. HALE: This is strictly back-of-the-envelope type calculations at this point. I don't know whether or not -- what discharges the storm concentrations would result in.

The first question I have on modeling is to see what these discharges of stormwater with these effluent concentrations -- under the storm conditions if we would be -- would have a higher flow than the drought flow condition which was modeled.

When you have a storm event, the stream conditions are different, the hydrology is different, the modeling characteristics. We could work out the scenario. And it's true that when you've got a huge storm, water fires right out the bay and out the Golden Gate. We might even probably need to talk about that and work on that.

Comment: MR. WALTNER: Thank you.

Good afternoon. My name is Alan Waltner and I have served as counsel to the Alameda Countywide Clean Water Program for seven years now, through the first and second rounds of NPDES permits and also the 1995 Basin Plan amendments for the San Francisco Bay area. I'll be following up on Robert Hale's comments he presented about the practical issues we're worried about.

Our concern fundamentally is a set of inconsistent statements in the preamble regarding how this rule would apply to municipal stormwater dischargers. At one point, for example, it states that alternate anticipated criteria may apply through simply best management practices, which is happening currently.

At other points in the preamble it suggests that we would have to do whatever it takes to make wasteload reductions under a waste allocation system or water-based numeric effluent limitations that would be keys to the standards. And depending on which of those interpretations you apply, the difference is significant.

Right now we're doing best management practices under the criteria of Section 402(p), that we have to do all that we can to the maximum extent practicable, and we estimate addressing pollution in stormwater for Alameda County to cost somewhere in the approximate neighborhood of 10 million a year, if I'm right.

It we had to do whatever it took, it -- by initial analysis, if we had to do whatever it took to provide a wasteload reduction that would be a proportionate share -- actually, copper mostly -- by end-of-pipe treatment of the entire stormwater flow of the county to produce the proportionate reductions, and you start coming up with figures in the range of $60 billion from Alameda County.

So it's incredibly important for us that the preamble language be clarified or -- and we think in a way that's consistent with Section 402(p), that the municipal stormwater systems only need to do appropriate MEP level controls.

Now, industrial stormwater dischargers under Section 402(p) may be subject to 301 and the numeric effluent limitations waste water quality standards. There is a clear distinction in Section 402(p) between the treatment of the industrial stormwater dischargers and the municipal stormwater dischargers. We think you need to maintain that distinction.

Now, I've noted that the regulation itself seemed to preserve the existing implementation policy of the State Water Resources Control Board. The policy of the State Water Resources Control Board simply requires implementation of BMPs to comply with 402(p) criteria. And to the extent that the rule keeps that implementation policy in place, then we're simply continuing what we're doing, the implementing of BMPs. That is something that we've already bought into and recognized we're obligated to do.

But if some of the significant statements in the preamble language were to prevail and we should have to do whatever it takes to provide proportionate wasteload reductions, it would lead to significant disruption and other legal problems that violate the description of Section 402(p) review procedures for the 1995 Basin Plan.

In that sense you would be impliedly repealing that implementation which would violate the review of the EPA subject to the 1995 Basin Plan, because it's impliedly repealing the implementation provision that we only have to do best management practices.

I think the bottom line is we're asking for EPA to clarify that Section 402(p) is what controls in this situation when applied to municipal stormwater dischargers, that we are obligated to keep pursuing maximum extent practicable controls, but that Congress has concluded there shouldn't be a requirement that we do whatever it takes, regardless of cost. And again, the costs are substantial to meet these numbers.

Thank you.

Comment: MR. HARRISON: Doug Harrison, General Manager of the Fresno Metro Flood Control District. I also happen to serve currently as a member of EPA's Wet Weather Advisory Committee and as liaison for FACA to the Stormwater Phase II FACA, so I've had the benefit of some additional exposure to some of these issues of concern recently.

I would endorse the comments of concern that Mr. Waltner just described. We're going to address these in written comments, but I wanted to touch verbally today on some that stand out, that flow from those concerns.

We agree with the concern that the preamble appears to try to codify the Elliott memorandum of 1991 and as to produce a result that was not intended by Congress in the 1987 Act amendments.

There are references on pages 42184, 186 and 187 of your preamble where these concerns arise, where you fail to address the clear language spelled out in the Clean Water Act that relates to municipal stormwater systems. We think for the rule to resolve this deficiency that there needs to be some clarification specifically addressed.

We believe that EPA itself is aware of the congressional intent with respect to the language in Section 402(p) as that relates to the municipal systems. In its draft stormwater regulations of October 1986, EPA included specific language that cited quite clearly the congressional intent and the understanding of that intent as it related to municipal systems and the issues around the permittings of those municipal stormwater systems.

Comment: MR. BRENT: Good afternoon.

I thank you for this opportunity to speak on the proposed rule. I'm Dave Brent, vice chairman of the California State Water Quality Task Force and supervisor of the City of Sacramento's stormwater management facility. I've been supervisor of the City of Sacramento's Stormwater Management Program for the past six years.

My comments are representative of at least nine major metropolitan stormwater programs in California, all with active stormwater management programs through the State Water Quality Task Force. You will also be provided with comments down in Los Angeles tomorrow.

We would echo Bob Hale and Doug Harrison. I think it's important that you hear from the state water interests, the State Water Quality Task Force on stormwater and the technical elements of the CTR itself.

This said, there are four major concerns that the State Water Quality Task Force and the Sacramento Stormwater Program have with this proposed CTR.

The first concern is the discussion in the preamble that states that the municipal stormwater permits must include limits necessary to implement applicable water quality standards. This approach continues the erosion of Congress's intent in the 1987 Clean Water Act amendments as implemented in Part 402(p) of 40 CFR, that applied the MEP standard, maximum extent practicable, to municipal stormwater discharges.

While the proposed rule appears as if it may recognize this MEP standard by giving the permit writers flexibility to express effluent limits as best management practices when the permitting authority determines that it is infeasible to express numeric limits, it doesn't come out and say what the regulations clearly require, that municipal stormwater dischargers must effectively control non stormwater discharges and control the discharges of pollutants to the maximum extent practicable.

In short, we believe that the preamble should not mince words and should clearly state that stormwater -- municipal stormwater discharges are subject to MEP.

Comment: MS. RUSSICK: Kathy Russick, speaking on behalf of the Sacramento County Stormwater Quality Section, who is one of four member agencies of the Sacramento Stormwater Management Program, the other agencies being the cities of Sacramento, Galt and Folsom.

And I would like to note that many of the challenges facing the Sacramento Stormwater Program which I raise here are also the same challenges facing other stormwater programs in the state.

Specifically, I will be addressing today the concern raised by these stormwater agencies that the California Toxics Rule will require municipal stormwater programs in California to meet numeric water quality limits.

The interpretation of the rule that we are -- this interpretation of the rule we are concerned with was discussed last week at a state Stormwater Quality Task Force meeting. We discussed it with a representative of the State Water Resources Control Board and he confirmed the interpretation specifically that municipal stormwater programs will have to implement ever-escalating BMPs until the numeric discharge limits are achieved.

Response to: CTRH-001-040

Comment: My name is Chris Crompton and I'm the manager of environmental resources for the Orange County Public Facilities and Resources Department. My office address is 10852 Douglass Road, Anaheim, California.

Today I'm presenting comments on the draft California Toxics Rule on behalf of the County of Orange and the Orange County Flood District. The County of Orange is the principal permittee on municipal stormwater permits for Orange County. These permits cover stormwater discharges for the county, flood district, and 31 incorporated cities.

In the main, the County of Orange supports the comments presented on behalf of the California Stormwater Quality Task Force by Chairman Robert Hale at the public hearing in San Francisco yesterday and by other municipal speakers from Sacramento County and Fresno. The County has been an active participant in the Task Force and in the development of those comments. Today I will be presenting our general concerns regarding the California Toxics Rule as it applies to our municipal stormwater quality management program. More detailed written comments on the proposed rule are being prepared for inclusion in the public record.

Our written comments will focus on challenging a number of basic assumptions in the California Toxics

Rule. In brief, we're going to be questioning the following:

Are the criteria applicable to municipal stormwater discharges?

In the preamble to the proposed rule, EPA assumes that these criteria for priority toxic pollutants apply to municipal stormwater discharges. We note for the record, however, that the applicability of water quality based effluent limits on municipal stormwater discharges has not been resolved. The Clean Water Act only requires dischargers of municipal stormwater to reduce pollutants "to the maximum extent practicable."

As noted in the Task Force testimony yesterday, in the preamble, EPA assumes that the application of water quality based effluent limits to stormwater discharges is appropriate and that the numerical limits can be imposed on such discharges sometime in the future. We believe that this assumption is incorrect and is directly contradicted by the plain language of Section 402(p) of the Clean Water Act.

Response to: CTRH-002-001

EPA disagrees with the comments. See response to CTR-001-003. Comment: THE ELLIOT MEMORANDUM SHOULD BE RESCINDED, RATHER THAN CODIFIED, IN THE CALIFORNIA TOXICS RULE

As support for much of the problematic language in the preamble to the CTR, EPA cites a January 9, 1991, memorandum from E. Donald Elliot to Nancy J. Marvel, Region 9 ("Elliot memorandum") which concluded that water quality based numeric effluent limitations apply to storm water discharges.

The Elliot memorandum contains a number of critical flaws and should be rescinded. Any attempt to rely on the Elliot memorandum in the proposed CTR, or to codify the Elliot memorandum, would subject the CTR to challenge based on these flaws.

The Elliot memorandum acknowledges that: "Section 402(p)(3) is clearly intended to draw a distinction between the requirements on industrial and municipal storm water discharges." Elliot memorandum at page 3. (*8) However, the memorandum derails by assuming an erroneous and contrary conclusion:

Section 402(a)(1) requires that all NPDES permits comply with the applicable provisions of section 301. This includes compliance with appropriate technology-based standards and effluent limits (sections 301(b)(1)(B), 301(b))2)). Permits must include "any more stringent limitation" necessary to meet WQS. Section 301(b)(1)(C).

Elliot memorandum at page 2. The critical flaw in this conclusion is that Section 402(p) establishes the applicability of Section 301, making Section 301 applicable only to industrial, and not municipal, storm water systems. Section 402(a) does not override, or conflict with, the applicability provisions of Section 402(p). In fact, by referring only to "applicable requirements under section 301," Section 402(a) acknowledges that not all "requirements" of Section 301 are applicable to all NPDES permits issued under Section 402. Among the limitations on such applicability are those set forth in Section 402(p).

The analysis in the Elliot memorandum also ignores a number of critical rules of statutory construction. First, as discussed above, the Elliot memorandum's reading of the statute would result in the retroactive application of Section 301(b)(1)(C) to municipal storm water systems, despite the absence of any evidence of Congressional intent to have created a retroactive system (and, in fact, despite the evidence in Section 402(p) to the contrary).

Second, the Elliot memorandum ignores the maxim that expresio unius est exclusio alterius ("to express one thing is to exclude all others"). Sutherland, supra, at S 47.23. The maxim applies to the interpretation of Section 402(p) in at least two ways. First, by making MEP-level controlsthe standard for municipal

storm water systems, other control approaches (such as water quality based effluent limitations) are excluded. Second, by making Section 301 applicable only to industrial storm water discharges, the application of Section 301 to municipal storm water discharges is excluded.

The maxim is closely related to the "plain meaning" rule. Here, Section 402(p) plainly states that MS4s are only subject to MEP-level controls. Section 402(p) does not leave open any possibility that MS4s might be subject to more stringent water quality based effluent limitations.

The Elliot memorandum also violates the plain meaning rule by applying the broad principles of the Act to override the statute's express provisions in Section 402(p). Likewise, extrinsic factors not appearing on the face of a statute cannot be used to override the express statutory language or create an ambiguity. Sutherland, supra, at Section 46.04.

The Elliot memorandum vainly seeks salvation by citing Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc., 467 U.S. 837, 842-43 (1984) ("Chevron") in support of its flawed analysis. However, only where the statute is ambiguous does the doctrine described in Chevron come into play. Yet Section 402(p) is unambiguous and exclusive in its application of MEP-level controls to MS4s.

As summarized by the D.C. Circuit in American Petroleum Inst. v. EPA, 52 F.3d 1113, 1119 (D.C. Cir. 1995):

Under the Chevron doctrine, a court reviewing an agency's interpretation of a statute it administers must first determine whether Congress has directly spoken to the precise question at issue. If the intent of Congress is clear, the review ends there for the court must give effect to the unambiguously expressed intent of Congress. Id. at 842-43. If the court determines that Congress has not directly addressed the precise issue, however, it then goes to the second step of the review to determine whether the agency's interpretation is based on a permissible construction of the statute. Id. at 843.

52 F.3d at 1117. Here, the precise issues of: (1) the control technology standard to be met by MS4s, and (2) the applicability of Section 301, have been addressed in the statute. EPA is not, as the Elliot memorandum argues, free to substitute its preferred result for the approach selected by Congress. (*9)

Rather than addressing these critical flaws in its analysis, the Elliot memorandum spends considerable time pursuing a red herring, arguing that the plain meaning of Section 402(p) (limiting MS4 control standards to the MEP level) would impliedly repeal Section 301 (which EPA argues makes all dischargers subject to more stringent water quality based effluent limitations). The Elliot memorandum argues that this would "read Section 402(p)(3)(B) as overriding 301(b)(1)(C)." Elliot memorandum at page 4. Yet Section 402(p) did not "impliedly repeal" or "override" Section 301; Section 402(p) actually confirmed the operation of Section 301 as applied to industrial storm water systems. The fact that Section 402(p) created a distinction between two categories of dischargers is perfectly ordinary. Congress routinelydelineates the applicability of statutes without resulting in "implied repeals" of the delineated provisions. EPA's argument (that making MS4s subject to water quality based effluent limitations exceeding MEP-level controls is necessary to avoid an implied repeal of Section 301) is specious.

The analysis in the Elliot memorandum is flawed and the memorandum's conclusion is only arguably correct as applied to storm water discharges associated with industrial activity. Municipal dischargers need only address water quality standards through MEP-level reductions (*10) The Elliot memorandum should not be relied upon or codified by EPA in the CTR, but instead should be expressly revoked given its demonstrated lack of merit.

(*8) The Elliot memorandum also states that:

Section 402(p) also specified the levels of control to be incorporated into storm water permits. Permits for discharges associated with industrial activity are to require compliance with all applicable provisions of Sections 301 and 402 of the CWA, i.e., all technology-based and water quality-based requirements. Section 402(p)(3)(A). By contrast, permits for discharges from municipal separate storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable" ("MEP"). Section 402(p)(3)(B)(iii).

Elliot memorandum at page 2.

(*9) Moreover, the protection of the Chevron doctrine cannot be invoked without including the agency interpretation in a regulation. In Chevron, the Supreme Court found that Congress had left a gap for EPA to fill through rulemaking on the technical definition of "stationary source" under the Clean Air Act, and that EPA's regulations filling that gap were within the permissible range of discretion intended by Congress. Chevron held that where a statute includes a broad definition, the very breadth of the definition implies a delegation to the agency to fill the gap in a manner consistent with the goals and purposes of the statute. Yet the position in the Elliot memorandum has never been incorporated in a regulation; agency staff pronouncements of lesser stature are ineligible for the deference that Chevron would provide.

Finally, EPA's interpretation is inconsistent, both as between the Elliot memorandum and the Interim Permitting Policy, and even within the Elliot memorandum. In a closing footnote EPA acknowledges that:

There may be some municipal separate storm sewer systems which are unable to meet even the three-year compliance date in their permits. The Agency retains the discretion to issue an administrative order fixing a schedule for compliance if compliance is not achieved in that three-year period.

Elliot memorandum at 5. The basis for this inconsistent position contemplating discharges in excess of water quality based effluent limitations is not stated. More importantly, any deference under Chevron is limited where EPA's own interpretation has been inconsistent.

(*10) The ACCWP also objects to the indirect way in which this issue is being presented. The Elliot memorandum was issued without benefit of any public comment, and no EPA regulation has ever put forward for judicial review the positions taken in the Elliot memorandum. EPA owes it to the state and local agencies that will be affected by this rule to act in a more straightforward manner. If EPA is going to put the position taken in the Elliot memo forward as official policy binding on permit decisions, the agency should do Bo in a judicially reviewable form so that government agencies that would be affected by the positions taken in the memorandum have a fair opportunity to seek a judicial determination of the validity of that approach.

Comment: 1. The preamble of the proposed CTR, and therefore the apparent intended application of the rule, is inconsistent with the Clean Water Act.

Several broad, ambiguous statements in the preamble of the proposed rule imply that Clean Water Act section 301 requirements apply to all dischargers, including municipal stormwater systems. These presumptions must be qualified to recognize the clear intent of Congress and plain language of the CWA, section 402(p) which clearly require municipal storm water dischargers only to adopt controls to reduce pollutants in storm water to- the maximum extent practicable and to eliminate non-storm water discharges. The section's intent is demonstrated through the application of section 301 requirements, and related application of numeric effluent limitations or wasteload allocations in NPDES permits, to industrial stormwater discharges only.

EPA is obviously aware of Congress's intent as to municipal storm water discharge requirements. EPA included in its published draft Phase I municipal storm water regulations a quote from the Congressional Record of October 16, 1986, citing that intent.

Without a clear citation of the provisions of CWA section 402(p), the preamble to the proposed rule appears to be an attempt to codify the Elliot memorandum of January 9, 1991, and to create via this rule a result not authorized by Congress.

In order to eliminate this fundamental legal flaw in the proposed CTR, and eliminate the potential for future misinterpretation and controversy, each of the following statements from the preamble (at a minimum) must be clarified and/or qualified so that they do not appear to override or retract CWA section 402(p).

"When these proposed federal criteria take effect, they will create legally applicable water quality standards ... in California ... for all purposes and programs under the CWA." [p. 42160. This statement must include recognition that for municipal storm water dischargers, the CWA objectives can be addressed through best management practices, implemented to the maximum extent practicable (MEP), as established by CWA section 402(p).]

"CWA section 301(b)(1)(C) ... requires NPDES permits to contain limitations required to implement any applicable water quality standard established in the CWA." [p. 42162. The text should note that section 301 (b) (1) (c) does not apply to municipal storm water dischargers, as established through section 402(p).]

"If a discharge causes, has the reasonable potential to cause, or contributes to an excursion of a numeric or narrative water quality criteria, the permitting authority must develop permit limits as necessary to

meet water quality standards." (P. 42184. Again, for municipal storm water dischargers, the preamble and CTR must make clear the MS4 permits must: address this CWA objective through the MEP requirement.]

"Point source and nonpoint source allocations are established so that predicted receiving water concentrations do not exceed water quality standards." [p. 42185.1; and

"[NPDES] permits for wet weather point source dischargers must include limits necessary to implement applicable water quality standards, through application of water quality-based effluent limitations or WQBELs." [p. 42186. These two statements are only correct as applied to industrial storm water dischargers; numeric effluent limitations or wasteload allocations can not be legally, reasonably, or practically applied to municipal storm water discharges.]

Comment: RECOMMENDED MODIFICATIONS

To address our concerns, we recommend the following modifications which do not undermine the toxic pollutant control actions envisioned in EPA's economic analysis (e.g., BMPs for stormwater and source control). In fact, some of these recommendations would provide incentives for greater movement toward achieving the water quality criteria than would occur under the Rule as it is currently proposed.

I. Recommendation: Modify the Preamble statement that indicates municipal wet weather discharges must comply with water quality standards or WQBELs (Preamble pages 42186-42187).

* It is not a requirement of the CWA or EPA that wet weather discharges must meet water quality criteria. If it were, the adverse economic impact on municipal stormwater programs would be enormous. The CWA, at best, is ambiguous on this issue; EPA regulations do not address it; and the Elliott memorandum, which appears to be the primary basis for EPA's position on this issue, is not a legitimate basis for such a position. The Elliott memorandum is an internal EPA memorandum and; therefore, is not an independent interpretation of the CWA. The Elliott memorandum does not constitute EPA policy and is based upon a false premise and an inaccurate reading of the preamble to EPA's 1988 proposed stormwater regulations. The Elliot memorandum contains other erroneous conclusions that have never been applied to municipal stormwater permits (e.g., that municipal stormwater dischargers must comply with water quality standards within three years of permit issuance).

* EPA has routinely approved municipal stormwater NPDES permits that have not included requirements to comply with water quality standards (e.g., Tulsa, OK; Greesnboro, NC; Denver, CO; Portland, OR; Cedar/Green (Seattle), WA; Sarasota County, FL; and Phoenix, AZ).

* If EPA does not modify the Preamble statement to clarify that municipal stormwater dischargers are not required to comply with these water quality standards, then EPA must include the cost of the structural controls necessary for compliance in its economic analysis and, using these costs, address the requirements of Presidential Executive Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act.

Comment: I represent the Alameda Countywide Clean Water Program ("ACCWP") in a variety of matters regarding the ACCWP Storm Water Management Plan ("SWMP") and associated National Pollutant Discharge Elimination System ("NPDES") permit. The ACCWP is a consortium of the fourteen cities in Alameda County, the County, the Alameda County Flood Control and Water Conservation District, and Zone 7 of the Alameda County Flood Control District. Those agencies have joined together in a coordinated approach to storm water management and control, and are the co-permittees under an NPDES permit that recently was reissued by the San Francisco Bay Regional Water Quality Control Board ("RWQCB").

This letter provides comments of the ACCWP on legal issues raised by the August 5, 1997, proposed rule regarding "Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California." 62 Fed. Reg. 42160 ("California Toxics Rule" or "CTR"). By copy of this letter to the State Water Resources Control Board ("SWRCB"), we also provide comments on the SWRCB's parallel implementation rule, proposed September 12, 1997. Comments on the scientific and technical issues raised by the proposed CTR will be submitted separately. (*1)

BACKGROUND

Local governments recognize that they have a key role in addressing the contribution of municipal storm water discharges to water quality problems and the ACCWP takes that role very seriously. During the first five years of the program, for example, ACCWP members adopted comprehensive storm water management ordinances and have undertaken a broad range of initiatives to reduce storm water pollution. This program has won numerous awards, including EPA's 1994 National Second Place Award for the Outstanding Municipal Storm Water Control Program.

However, important practical constraints are faced by municipal dischargers which, unlike most industrial sources, cannot simply cease discharging. First is the chronic problem of limited resources, which has been exacerbated by the recent passage of Proposition 218 in California constraining the fee-based revenue sources upon which the ACCWP members generally have relied.

Second, municipal discharges have limited authority over the products and activities that contribute to storm water pollution. For example, home garden care pesticides have been identified as a significant contributor to toxicity in storm water runoff, but municipalities are preempted from regulating those pesticides directly and must rely instead on public information campaigns. Similarly, copper from brake linings is also of concern, but local governments cannot direct the formulation of brake linings.

Third, there are limited opportunities for end-of-pipe storm water discharge controls, and such controls would be both costly and environmentally damaging. See, In re Citizens for a Better Environment, et al, SWRCB, WQ 91-03, at 51-52 ("Treatment techniques such as wet-detention basins also require large land areas to contain high volume, variable storm flows. These techniques therefore result in extremely high costs . . . . The impacts of holding large amounts of storm water for treatment may also pose potential adverse environmental impacts".)

Since such storm water treatment plants generally would need to be constructed at the downstream end of storm water flows, they would need to be located adjacent to the San Francisco Bay. However, many of the undeveloped sites adjacent to the Bay are constrained by wetland and endangered species concerns, as well as presenting potentially significant open space, energy, visual, odor, noise and other impacts. Given siting constraints in the substantially developed inner San Francisco Bay Area, it may not even be possible to site the substantial storm water collection, transportation, storage and treatment facilities that might be needed to produce pollutant reductions of the magnitude assumed by EPA in the proposed rule.

As a result of the constraints faced by municipal storm water systems, existing water quality criteria in the San Francisco Basin Plan historically have been implemented in the context of NPDES permits for storm water systems through escalating best management practices ("BMPs"), rather than through numeric effluent limitations ("NELs") or wasteload allocations ("WLAs"). The reason for this is that NELs and WLAs currently are infeasible for municipal separate storm sewer systems ("MS4s").

This implementation policy was first embodied in the 1986 Basin Plan, which retained considerable permitting discretion for nonpoint source controls, and did not require municipal permittees to meet numerical water quality objectives. See, In re Citizens for a Better Environment, et al, SWRCB, WQ 91-03, at ii.

The 1995 Basin Plan, at pages 4-14 and 4-15, continued and clarified this implementation policy, stating that:

Since both the sources of pollutants in stormwater discharges and the points of dischargeare diffuse, and the methods of reducing pollutants in stormwater discharges are in the development stage, water quality-based numerical effluent limitations are not feasible at this time. Instead, stormwater permits will include requirements to prevent or reduce discharges of pollutants that cause or contribute to violations of water quality objectives . . . . If this first phase does not result in attainment of water quality objectives, the Regional Board will consider permit conditions that may require implementation of additional control measures.

This implementation policy has also been recognized by the State Board, "Storm water permits for MS4s must achieve compliance with water quality objectives, but they may do so by requiring the implementation of BMPS." SWRCB Order 96-13 at 11.

The Basin Plan's approach is consistent with EPA policy, reflected in EPA's August 26, 1996, "Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm water Permits" published at 61 Fed. Reg. 43761 et seq. ("EPA Interim Permitting Policy"). The EPA Interim Permitting Policy:

uses best management practices (BMPS) in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards.

Numeric effluent limitations are not required under the EPA Interim Permitting Policy (*2)

The current NPDES permit for the ACCWP was developed under this approach, by requiring the dischargers to carry out the SWMP while providing for annual improvements through a work plan process.

Any attempt to make water quality standards for San Francisco Bay directly applicable to municipal storm water dischargers as numeric effluent limitations would conflict with these carefully considered provisions of the Basin Plan and State Board implementation policy.

(*1) As you know, several storm water systems have requested additional time to comment on the proposed rule, a request in which the ACCWP has joined. Additional time is particularly important given the interdependence between the CTR and the recently proposed "Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California," ("State Implementation Policy" or "SIP") released by the SWRCB on September 12, 1997, just two weeks before the comment deadline an the CTR. The way in which the CTR is implemented is central to its effects on storm water dischargers, as discussed below. Unfortunately, the State Implementation Policy does not fully correct or moderate the critical problems created by the proposed CTR.

(*2) See also, EPA, May 3, 1996, "Draft Language for Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits." EPA also indicates in the draft policy that neither the statute nor EPA regulations require numeric effluent limitations in municipal storm water permits, and that BMPs can substitute for such numeric limitations.

Comment: THE REGULATION SHOULD MORE CLEARLY CONFIRM THE CURRENT IMPLEMENTATION POLICY, AND CONFLICTING LANGUAGE IN THE PREAMBLE SHOULD BE REMOVED

At the outset, we note that the actual language of the proposed regulation appears to be appropriately qualified, stating that:

The criteria established in this section are subject to the State's general rules of applicability in the same way and to the same extent as are other Federally-adopted and State adopted numeric toxics criteria when

applied to the same use classifications . . . .

Page 42206, Proposed Section 131.38(c). As discussed above, State Board decisions in California and the San Francisco Basin Plan have made clear that MS4s need address WQS only through the implementation of escalating BMPS, all within the framework of the MEP standard.

Unfortunately, the recently proposed State Implementation Policy ("SIP',) is inconsistently drafted regarding this point. The state policy does, in Section 5.1, state that:

It is the intent of the SWRCB, in adopting this Policy, that the implementation of priority pollutant criteria/objectives and other requirements of this Policy through NPDES permits for storm water shall be consistent with the requirements of the existing SWRCBand RWQCB storm water program.

Draft State Implementation Policy at 5.1. In Chapter 5.1 of the Functional Equivalent Document ("FED") supporting the SIP, existing policy is correctly described as follows:

The RWQCBs have adopted NPDES storm water permits for MS4s . . . The MS4 permits require the discharger to develop and implement a Storm Water Management Plan whose goal is to reduce the discharge of pollutants to the maximum extent practicable (MEP). KEP is the performance standard specified in Section 402(p) of the Clean Water Act. Components of the storm water management plan address public education and outreach; illicit connection/illegal discharge detection and elimination; fiscal resources; monitoring; and the best management practices (BMPS) which will be utilized. To date, the efforts of the municipalities subject to MS4 permits have been focused on implementation of BMPs to reduce pollutants, rather than on treatment of storm water to remove pollutants.

FED at V-117 (Emphasis Added, Italics in Original). The FED goes on to state that:

Because of the nature of storm water discharges and the typical lack of information on which to base numeric water quality based effluent limitations, it has not been feasible for the SWRCB to establish numeric effluent limitations for storm water permits.

FED at V-118. The policy alternative selected in the proposed SIP is described as follows:

The existing NPDES storm water permits contain narrative objectives, rather than the numeric limits found in the more conventional NPDES permits. Compliance with these narrative objectives is a function of the dischargers' timely and effective implementation of the management practices and programs identified in the storm water management plan (MS4 permits) or the storm water pollution prevention plan (industrial/construction permits).

FED at V-119.

Despite this carefully drafted language in the FED, general statements included in the SIP suggest that WQS may need to be translated into NELs or WLAS, regardless of whether those NELs or WLAs can be satisfied by MEP-level controls. Draft SIP at 2, 910. This would violate the approach of Clean Water Act Section 402(p), as well as requirements of the Porter Cologne Act described below. (*5)

We request confirmation of the statements in the proposed rulemaking that MS4s only need to address WQS through the adoption of BMPs reflecting MEP-level controls, and that EPA does not intend that the state apply the proposed WQS as numeric effluent limitations or as the basis for wasteload allocations. Specifically, we request that EPA include language similar to that quoted above from the FED in the final

rule, and/or the preamble to the final rule.

(*5) The SIP at page 10 has particularly problematic language which states that:

Regardless of which method is used for deriving water quality-based effluent limitations, the calculated water quality-based effluent limitations shall be compared to the technology-based effluent limitations for the pollutant, and the most protective of the two types of limitations shall be included in the [permit].

This language could be read to suggest that NELS or WLAs could override the MEP standard of Section 402(p), which would violate both the Clean Water Act and porter Cologne Act.

Comment: City of Stockton, California Comments on the Proposed "California Toxics Rule" 62 Fed. Reg. 42160-42207 (August 5, 1997)

The City of Stockton (the "City" or "Stockton") operates both wastewater and storm water facilities which discharge to waters of the United States. Consequently, the City is directly impacted by the Environmental Protection Agency's ("EPA" or the "Agency") proposed rulemaking. The following provides the City of Stockton's comments on the California Toxics Rule ("CTR" or the "rule") (62 Fed. Reg. 42160-42207).

As was the case with the prior National Toxics Rule ("NTR"), this proposal only addresses toxic pollutants listed pursuant to Section 307(a) of the Clean Water Act ("CWA") (approximately 126 pollutants). Conventional and non-conventional pollutants (such as ammonia, chlorine, iron, aluminum and color) are not addressed under this rule proposal. In addition, this proposal does not address whole effluent toxicity. The CTR addresses not only applicable water quality criteria (acute, chronic and human health) but also implementation methodologies such as the appropriate design instrearn flows to apply in developing permit limits (e.g., 7/Q/10, 30/Q/5, harmonic mean). Based upon the preamble to the proposed rule, the proposed water quality criteria will apply to both point source and non-point source discharges such as storm water. Due to the qualifying language contained in the rule, it is not apparent that criteria application will be uniform throughout the state and will depend somewhat on existing Basin Plan provisions.

Contrary to the rule preamble, the City does not believe that this regulatory proposal reflects the latest scientific information regarding proper application of the proposed criteria. Due to the expansive application of human health-related criteria to all streams designated as MUN (which is a default use designation under the Basin Plans) and the failure to allow site-specific modification to reflect actual use conditions, the potential receiving waters classified as exceeding human health criteria will be greatly exaggerated (e.g., stringent water ingestion and fish consumption-based criteria will be applied to ditches and intermittent streams). Consequently, the cost impact associated with this rule will be significantly greater than it otherwise should be.

In particular, the application of the criteria to storm water discharges will produce widespread non-compliance with the proposed criteria for common metals such as zinc, copper, and lead and will trigger the need for extensive implementation of costly technologies, unrelated to actual environmental needs. Therefore, the City respectfully submits that the CTR needs to be restricted in scope, updated to include more recent information regarding the expected impact of pollutants on the environment, and revised to allow utilization of relevant site-specific information to avoid misapplication of limited local resources. The following presents an overview of the proposed rule and identifies issues of concern from both storm water and wastewater discharge perspectives.

Comment: VI. Application of Criteria to Wet Weather Flows is Inappropriate

The CTR specifically states that all toxies criteria apply to wet weather flow events and storm water discharges. EPA further states that it is unlikely that specific effluent limits will be established because such limits are "infeasible." Regardless of EPA's position concerning the ability to establish specific effluent limits, it is apparent that application of the proposed criteria to storm water discharges either through effluent limits or receiving water limits will place virtually all storm waters in violation of the CTR. Thus, municipalities and water conservation districts will be exposed to citizen suits and civil penalties under state and federal law. As a result, major expenditures of local resources would be required to eliminate violations of the proposed criteria, even where it is apparent that there is no actual environmental harm. Because the rule fails to assess the significant economic impact associated with application of the criteria to storm waters and there is no information in the record supporting that it is necessary to meet the criteria in storm waters to adequately protect the environment, the CTR should specifically exempt storm waters from the criteria application. The legal and technical basis for this request is discussed below.

Few, if any, of the EPA criteria were designed to apply to storm water-related events, The criteria assume that extended exposure to the pollutants of concern will occur, that sensitive organisms are present, and that the form of pollutant and water chemistry used to conduct the laboratory studies underlying the criteria are similar to the receiving water conditions. All of these assumptions are known to be in error for storm water discharges, as follows:

* Exposures will be intermittent, variable and generally far shorter than the exposure used to establish the acute criteria (96 hours) and certainly far less than any chronic or human health based criteria (30 days to 70 years). EPA's "fast acting toxicant" evaluations confirm that short duration exposures may often be an order of magnitude higher than longer term exposures without causing adverse impacts (see, Section II.A.4.a.1 above). Thus, direct application of the criteria (with or without a mixing zone) will produce unnecessarily restrictive requirements.

* Water chemistry in storm water is dramatically different than the typical pristine water used to assess pollutant impacts in the criteria tests (e.g., Lake Superior water). EPA has routinely acknowledged that water chemistry significantly impacts the effect of pollutants in the environment, and elevated TOC and TSS levels will significantly mitigate the toxicity of a wide range of metals and organics. (See, 62 Fed. Reg. 42175). The National Guidelines require modification of the criteria when it is apparent that the criteria will be overprotective as is the case in this circumstance.

* Sensitive organisms such as daphnids and salmonids, which often drove the criteria document calculations (e.g., metals criteria) cannot inhabit most receiving waters and certainly will not be present in intermittent streams. Turbulent high flow conditions alone would destroy fragile daphnids. Applying criteria to protect species that cannot possible exist in the receiving waters is clearly unnecessary.

* Guidance documents related to the translation of water quality criteria into permit limitations are not designed to address intermittent wet weather conditions. Criteria modification procedures mandated to apply to metals (WER Guidance) cannot be applied to short term, highly variable, intermittent exposure conditions without a major restructuring of the guidance documents.

* Permitting guidance recommended for usage with the CTR (e.g., (1991) TSD) does not have a wet weather analysis component and the statistical procedures are not applicable due to the lack of continuous discharge and infrequency of discharge conditions. The only comparable information contained in the TSD relates to mixing zones wherein the TSD states that environmental impacts cannot be properly assessed unless the time period of exposure is accurately considered due to the known dose/response relationships of various pollutants. EPA has also acknowledged that "[T]he human health risks of a substance cannot be determined with any degree of confidence unless a dose/response relationship is quantified" (62 Fed. Reg. 42175). As data on the short term dose/response is not included in the published criteria and the TSD procedures do not specify how to assess intermittent short term pollutant exposures to compare such exposures to longer term criteria, there is no objective basis upon which to apply even the acute criteria to storm water events.

Given the lack of experience of permitting authorities in properly applying water quality criteria to short term events, it is essential that EPA clarify that the proper application of criteria to wet weather events must account for the time period of exposure, the organisms present, and the different characteristics of the water in comparison to EPA laboratory studies. Absent the establishment of specific procedures to ensure that the criteria will be properly applied to the unique circumstances of storm events, EPA should not extend application of the criteria to wet weather events.

Application of metals criteria to storm water discharges will be particularly problematic as EPA is now recommending that the actual hardness of the receiving water be used and there is no assurance that dilution with receiving waters will be considered. Most of EPA's metals criteria assume that a metal becomes infinitely toxic as hardness approaches zero. This is not based on a detailed database of organism sensitivity at low hardness but is an artifact of the hardness/toxicity model that reasonably reflects the toxicity of metals under typical hardness conditions (50-200 mg/l). Storm water events, however, do not fit within the typical conditions that formed the basis of the current metals criteria.

The hardness of rain water is quite low and will result in extremely low limits if applied to storm waters. Hardness levels increase as the storm water contact time with the ground increases. However, prior to mixing with surface waters, it is not unusual to encounter hardness values in the 20 mg/l range. This produces extremely low acute and chronic criteria for a host of metals, most notable copper, zinc, and lead. For these parameters, the calculated criteria will range from less than 1 ppb to 30 ppb. Thus, application of the CTR criteria to storm waters would lead to the conclusion that most storm waters are an acute toxicity threat to the environment even though a more accurate application of the criteria would lead to an opposite conclusion for metals. This is not a minor difference in results and, unless corrected, will trigger the need for expensive biological testing to prove the obvious -- metals in storm waters are not toxic.

In addition to the concerns regarding application of metals criteria, it is apparent that there is no rational basis for applying long term human health criteria to short term storm water events. EPA should clarify that long term human health-based criteria (which assume 30 day to 70 year exposures) often based on long term bioaccumulation do not apply to short term storm water discharge events. This will prevent misapplication of the criteria that would otherwise occur under the Agency's proposal.

In summary, EPA should revise the scope of the CTR to specify that the criteria do not apply to storm water situations and that site-specific decisions on the need for reduction of pollutants in storm waters will be conducted.

Comment: Moreover, the Agency's position on the application of WQBELs to municipal stormwater discharges rests on a flawed internal opinion circulated from the General Counsel's office to Region 9's legal counsel in January 1991 (the so-called "Elliot Memo") which ignores the plain language of the statute and simply assumes that Congress's clear language was ambiguous. It has never before been

endorsed by the Administrator or been subjected to public comment process or the potential for judicial review. Therefore, if EPA wishes to try to make the Elliot Memo the law through the CTR, it first needs to go to Congress to amend the Act's unambiguous NPDES permitting requirements for municipal stormwater discharges.

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

5. The proposed criteria were established based on typical, steady flow wastewater discharges, and may not be applicable to wet weather flows. The USEPA in Washington is currently reviewing the applicability of present water quality criteria to wet weather discharges. Given the quantity of stormwater discharges, flow conditions in the receiving waters, the numerous discharge points, and variability in discharge quality, there is no published scientific approach for assessing the impacts of such discharges on designated uses.

We recommend that the rule not apply to MS4s until the USEPA has completed its study on the applicability of water quality criteria to MS4 discharges.

Comment: If the proposed rule is carefully and sufficiently modified to affirm a commitment by EPA to effect only its Congressional authorization as established by CWA section 402(p), then EPA's failure to assess municipal storm water dischargers" ability to attain the proposed standards and associated economic and environmental impacts may be set aside at this time. However, if EPA persists in maintaining the CTR as drafted in this regard, the ambiguities presented in the preamble demand serious consideration and analyses as follows.

a. Many of the criteria are not attainable or scientifically valid with regard to municipal stormwater dischargers, nor is the proposed approach consistent with an appropriate delegation of authority to the State.

i. Attainability of Standards

The statutory premise of the CWA is to provide water quality for protection and propagation of aquatic life, wildlife, and recreation wherever attainable. The CWA therefore establishes a reality test in that objectives must be attainable.

The proposed CTR criteria can not be attained by municipal storm water dischargers. The District treats through detention and retention all but 1% of its urban runoff on an annual average basis. Nonetheless, its urban runoff discharges, after detention, would exceed proposed dissolved copper, lead, and zinc criteria. Concentrations would need to be reduced by 67%-95% to meet the proposed chronic criteria. No storm water best management practices, including conventional end-of-pipe storm water treatment facilities (i.e., detention systems), are believed to be able to achieve these levels of reductions for these constituents.

Comment: 8. EPA states that NPDES permits for wet weather point source discharges must include limits in order to implement water quality standards, and that the water quality criteria presented in the rule will be used to develop WQBELs in NPDES permits for these sources. EPA does not address the exposure issues associated with using surface water quality standards developed using tests lasting 2-60 or more days to draw conclusions on discharges lasting minutes to hours. WERF has conducted research recently which shows clearly that the impact due to exposure of minutes is orders of magnitude less than the impact observed following days of exposure. Use of water quality standards to regulate most stormwater discharges is overly stringent and protective, which will ultimately result in the expenditure of resources on controls which offer no benefit. EPA should be responsible for justifying the use of water quality standards with stormwater discharges with data and illustrating why they are necessary to protect and support designated uses. The use of these standards under these conditions is arbitrary, at best.

Comment: Additional Comments

Presented below are some specific comments on statements made in the proposed CTR Federal Register.

Page 42160, third column, near the bottom, municipal stormwater dischargers should be added to the list of NPDES dischargers who have an interest in this rule. If anything, they probably will be affected more than any other entity.

Page 42161, third column, first paragraph, states,

"Numeric criteria for toxic pollutants allow the State and EPA to evaluate the adequacy of existing and potential control measures to protect aquatic ecosystems and human health. Numeric criteria also provide

a more precise basis for deriving water quality-based effluent limitations in National Pollutant Discharge Elimination System (NPDES) permits to control toxic pollutant discharges."

That statement is somewhat unreliable and misleading.

While it is bureaucratically simpler for regulatory agencies to numerically compare concentrations found in an effluent or in ambient waters with a chemical concentration-based water quality criterion, the claim made in the quoted statement is not necessarily true. In fact, rarely is the exceedance of numeric criteria a reliable basis for assessing the impacts of constituents on human health or the environment. While it may be more precise, it can be highly inaccurate. This is one of the areas that needs to be corrected by the US EPA where biological effects-based approaches are used, rather than chemical-based approaches for regulating such impacts as aquatic life toxicity for potentially toxic constituents.

Comment: Thank you for the opportunity to comment on the proposed California Toxics Rule. The City's comments are related to five main concepts:

1. The numerical standards are ambiguous or incomplete to address the variety of operating conditions under which discharges to waters of the United State occur.

Specifically, the City submits the following comments:

A. California's receiving waters have a very wide diversity of hydraulic and environmental conditions. The numerical standards do not take into account the wide range of rainfall patterns, storm durations, irrigation flows and power generation flows that are the current aquatic habitat. California's rivers are highly regulated, highly managed. The proposed regulations neither address this variety, nor provide a means by which numerical standards can be readily developed to address such variety.

B. The California Toxic Rule presents new water quality standards for the State of California. This rule

presents water quality standards for all water bodies within the state. Water quality standards as presented in this rule would apply to all environmental conditions (dry and wet weather). During wet weather, conditions in the receiving streams can be extremely variable due to the quality and quantity of stormwater. Treatment plants generally have hydraulic capacity to process twice the average dry weather flow received. Water quality standards were developed based on dry weather conditions. Therefore, numerical water quality standards should not need to be achieved during storm events. If water quality standards need to be achieved during storm conditions, it is suggested that new standards be developed to account for the changes in environmental conditions.

Comment: As you may or should know, the urban stormwater dischargers are not claiming that there are no water quality problems associated with their discharges. It appears that there may be real water quality problems in urban stormwater discharges due to chemicals, such as the organophosphate pesticides principally known at this time, diazinon and chlorpyrifos, which the US EPA either, in the case of chlorpyrifos for which there is a water quality criterion, has failed to implement a criterion or, for diazinon, has yet failed to develop a criterion. I understand that finally after years of delay where it has been well known by the US EPA that diazinon was causing widespread aquatic life toxicity, the Agency is now beginning again to formulate a water quality criterion for this chemical.

Even with the development of these criteria, however, it does not mean that they would be enforced. The chlorpyrifos situation is a prime example of where there is well-known aquatic life toxicity in many communities' stormwater runoff, yet the Agency, including US EPA Region 9, has failed to admit publicly that there is a problem, much less act to control the problem. A situation could readily develop where stormwater dischargers are required under CTR to spend massive amounts of public funds building "50 Oakland Coliseums" just to store stormwater runoff in Alameda County from a storm magnitude that occurs more frequently than once in three years because of administrative exceedances of several CTR-regulated heavy metals in the stormwater runoff which have been repeatedly found to be in non-toxic, non-available forms, including the dissolved forms. yet could have the treated stormwater discharge to San Francisco Bay be highly toxic due to unregulated or inadequately regulated

organophosphate pesticides. This is an artifact of the inappropriate approaches used by the Agency of focusing on chemicals, rather than chemical impacts, i.e. potential toxicants rather than toxicity.

Response to: CTRE-002-004

The scope of today's rule is to establish numeric criteria to bring California into compliance with CWA Section 303(c)(2)(B): Section 303(c)(2)(B) requires adoption of numeric criteria for priority toxic pollutants contained in CWA Section 307(a) for which EPA has issued Section 304(a) criteria guidance if those pollutants could reasonably be expected to interfere with the designated uses of state waters. The promulgation, implementation, and control of pollutants that are not identified as priority toxic pollutants (i.e, those pollutants that are not contained in CWA Section 307(a)) are outside of the scope of today's rule. Diazinon and chloropyrifos, the pollutants referenced by the commenter, are not contained toxic pollutants under CWA Section 307(a) and are thus outside of the scope of this rulemaking.

However, EPA notes that the CWA and Water Quality Standards Regulation requires all states, including California, to adopt water quality standards (which includes water quality criteria) sufficient to protect the designated uses of their waters. This requirement necessitates State adoption of criteria that are not included in the CWA Section 307(a) list. In addition, states may also use their narrative criteria to prevent toxic effects caused by pollutants that are not identified as priority toxic pollutants, such as those pollutants mentioned by the commenter, in instances where a state does not have numeric criteria in place or to supplement the numeric criteria

Comment: Even if it could be successfully argued that the CTR as drafted is applicable to the stormwater dischargers, we believe that the criteria is flawed. During one recent meeting of the Water Quality Standards Work Group of FACA, EPA headquarters staff made a presentation that reminded us of the language of the Act, which seems to establish a test of attainability -- a reality test, if you will -- that the objectives must be attainable.

We also have extensive data from the NURP program and the NPDES permits that suggest that through monitoring it was demonstrated that the criteria are not attainable, the concerns that you heard from the

two previous speakers. It is documented that episodic stormwater flows vary greatly the ability to handle -- in things like recovery times and so forth.

And I would also note a 1992 memo that was produced by Tudor Davis of the Office of Science and Technology, reporting on the CSO Wet Weather Panel that focused on some of these, and the fact that while they concluded it was not necessarily appropriate to produce a separate set of criteria just for wet weather conditions, that what the criteria did have to do is to be applied to both duration and the frequency and magnitude -- frequency and magnitude.

The EPA began this work shortly thereafter and brought to the Urban Wet Weather FACA the individual who is doing this work of application to the aquatic life criteria of these variables. The criteria analysis was to have been completed by September/October of this year.

We have to conclude that if the criteria as proposed in the current CTR proposal is in fact to be interpreted to include stormwater, that there are these inconsistencies that need to be addressed.

Certainly there's awareness at EPA of the limitations of BMP programs regarding attainment of CWA objectives and criteria.

The Phase II draft rule that is now before OMB for review provides for a complete comprehensive stormwater program evaluation in 13 years from the date of the adoption of that final rule, which is scheduled for March of '99. And that program definition included Phase I to Phase II programs, and goes on to state that there should be no additional BMPs required until that evaluation is completed.

It appears to limit flexibility -- would tend to limit state flexibility. We have concern about that, and also that it appears to limit the compliance schedule to 5 years. EPA has already cited the need to go to a 10-year evaluation after two permit terms for the entire stormwater program.

We have run models in our community FMFCD stormwater system. We capture 90 percent of all runoff in the community and keep it. It never gets to the waters of the U.S. The remaining 10 percent, we treat 90 percent of it through extensive detention.

Comment: MR. LEE: My name is Fred Lee, L-E-E.

I want to focus on one aspect of the discussions today, and that is the urban stormwater and highway stormwater runoff issues. These are of concern to me. I'm particularly concerned about this issue in applying these criteria to regulating stormwater runoff and the ultimate goal mandated by the Clean Water Act.

I have been involved in criteria and standards development since the 60s, I helped EPA develop its current approach as a peer reviewer for agencies for the so-called gold book criteria, which is still basically the approach being used today to promulgate these criteria.

There is no question, if you understand how the current criteria were developed, that they tend to significantly over regulate urban stormwater runoff. This will result in massive expenditures as we approach the goal of achieving water quality standards in stormwaters.

This is a well-known problem. Everyone knows this is a problem, but everybody says, "Well, apply BMPs for a while." And that's no man's land. what's that really mean and what's MEP mean and so forth?

When I looked at that rule, I said we really missed the boat by not discussing what it's going to cost to apply these criteria to urban stormwater as an ultimate goal where you have no measure for exceedence for five years. That's Clean Water Act requirements.

We've got to get these figures on the table and we've got to start to understand where we're heading for as a goal with respect to applying these criteria as ultimate goals for urban stormwater.

It's -- there may be situations it's 1 to 2 dollars per person per day in the regulated communities. That's the kind of cost we're talking about for achieving Clean Water Act requirements, with no more than one exceedence for constituents, as we've heard, such as copper and lead, zinc, et cetera -- 1 to 2 dollars per person.

We don't have lands to store this water in order to provide treatment, so it's -- to me, it's a matter for EPA as part of this rule to do a proper economic analysis of what it's going to cost the public actually to process ever-increasing BMPs until we get to the goal.

It's a serious mistake. We're talking about a massive bill for this country. And what are we going to get? We'll get a lot of over regulation because criteria are not applicable to this kind of situation.

We need different kind of criteria, and this has been well discussed; we understand that needs to be done obviously.

Response to: CTRH-001-061

Comment: My name is Gary Hildebrand. I'm with the Los Angeles County Department of Public Works, and I'm the stormwater permit program manager for Los Angeles County. I'm here representing the principal permittee for the L.A. County Municipal Stormwater Permit Program which is the largest municipal stormwater permit program in the nation. We have over 86 permittee cities in our program. We cover over a 3,000-square-mile watershed which contains like 9 million people. We also have a 3,000-mile-plus urban storm drain network that permittees must maintain.

First, I'd like to express our support and agreement with the comments expressed at the public hearing yesterday in San Francisco by Mr. Bob Hale, the chairman of the California Stormwater Quality Task Force, and also the other municipal stormwater program representatives, both there and at the hearing today.

Then I would like to provide some additional comments that are concerned to our municipal stormwater program. First off, compliance with the proposed criteria for stormwater discharges may be impractical. The proposed criteria was established for typical steady flow point source discharges and are not applicable to the wet weather flows. Quantity of stormwater discharges, slow conditions and receding waters, the numerous discharge points and the variability in discharge quality, there is no published scientific approach to determine the compliance with water quality criteria for stormwater runoff from a municipal storm drain system. Until such an approach is accepted and published by a regulatory agency, it should not be applicable to municipal stormwater discharges.

Response to: CTRH-002-024

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

6. The proposed criteria will apply to all inland surface waters and enclosed bays and estuaries, regardless of the designated or attainable uses for a water body. This is of particular concern for waters that only have flows during wet weather events or that are point source effluent dominated water bodies. Blanket application of water quality criteria to all waters without designated uses is inconsistent with Federal and State water quality laws. Water quality standards are made up of two components--designated uses and the appropriate criterion to ensure the designated use can be achieved. Assigning criteria to a water body without first considering the designated uses is inappropriate and could result in over restrictive, unnecessary permit limits potentially resulting in significant compliance costs to a discharger.

It is common in California for urban stormwater runoff discharges to be the primary or only source of waters to urban creeks and waterways, that is, there would be little or no flow during most of the year were it not for urban stormwater or other point source discharges. Given the potential compliance problems for stormwater discharges forcertain constituents (even after a fully implemented BMP program), a municipality could be forced to remove stormwater discharges from the creek. The costs would be significant and the benefit little, if any. In fact, the removal of these discharges would be environmentally damaging to aquatic life and wildlife that were supported by the effluent/runoff dependent waters.

Therefore, the proposed rule should be revised to avoid blanket application of the proposed criteria to all surface waters and to require appropriate beneficial and attainable uses of all waters be determined prior to imposing water quality criteria in the water body. The rule should also be revised to implement separate and distinct water quality criteria for water bodies that are primarily effluent or runoff-dependent.

Comment: 7. The proposed criteria will apply to all inland surface waters and enclosed bays and estuaries regardless of the designated or attainable uses for a water body. This is of particular concern for waters that only have flows during wet weather events, or that are point source effluent dominated water bodies. Blanket application of water quality criteria to all waters without designated uses is inconsistent with federal and state water quality laws. Water quality standards are made up of two components - designated uses and the appropriate criteria to ensure the designated use can be achieved. Assigning criteria to a water body without first considering the designated uses is inappropriate and could result in overly restrictive, or unnecessary permit limits, potentially resulting in significant compliance costs to a discharger.

It is common in California for urban stormwater runoff discharges to be the primary or only source of waters to urban creeks and waterways; that is, there would be little or no flow during most of the year were it not for man's activities. Given the potential compliance problems for stormwater discharges for certain constituents (even after a fully implemented BMP program) a municipality could be forced to remove stormwater discharges from the receiving water. The costs would be significant and the benefit little, if any. In fact, the removal of these discharges would be environmentally damaging to aquatic life and wildlife that were supported by the effluent/runoff dependent waters.

Recommendation: The proposed rule should be revised to avoid blanket application of the proposed criteria to all surface waters, and to require appropriate beneficial and attainable uses of all waters be determined prior to imposing water quality criteria in the water body. The rule should also be revised to implement separate and distinct water quality criteria for water bodies that are primarily effluent or runoff dependent waters. An example of such flexibility is the use of a less stringent cancer risk factor such as 10E-4 or 10E-5 for the human health criteria for effluent dominated streams.

Comment: The next and the proposed criteria will apply to Inland Surface Waters, Enclosed Bays, and Estuaries regardless of the designatable or attainable uses for water -- this is a particular concern that only flows during wet weather events or that are dominated water bodies.

There are many situations in our area where early stormwater runoff discharges to local creeks and waterways are the primary or only source of waters. There would be flow under most of the year were it not for discharges. Given the stormwater discharges and compliance problems with certain decisions, this would be even after a fully implementing BMP program. The municipality could be forced to remove the discharge from the creek constantly without benefit. In fact, removal of these discharges could be environmentally unsound given the wildlife that are supported by the effluent and/or runoff-dependent waters.

Response to: CTRH-002-025

The commenter feels that in situations where a municipality is unable to achieve compliance with CTR in an intermittent stream, they will be forced to continuously remove the discharge from the stream. EPA does not mandate removal of runoff as part of a storm water management plan, rather the upgrading / addition of BMPs to lower pollutant loadings. Commenter is right in that wildlife may be dependent on the intermittent flows which are totally of storm water origin. But it must be noted that the flora and flauna may also be similarly imperiled by toxics contained in the storm water effluent.

Comment: In addition, we would like to emphasize the following concerns for which greatly impact the Los Angeles County Stormwater Program:

7. The proposed rule provides only a five-year compliance schedule to achieve compliance with the proposed water quality criteria. Again, setting aside the issue of whether water quality standards actually apply to municipal stormwater discharges, municipal stormwater programs are long-term, BMP-based programs. Because of this, it will take many years for a municipality to realize any water quality benefits in the receiving waters. The preamble to the proposed rule addresses all wet weather discharges together in one discussion. Municipal stormwater programs should be discussed and treated separately from all other wet weather and point source discharges. These are unique programs and cannot be placed in a "one-size fits all" regulatory program. The proposed rule needs to account for the nature of stormwater discharges by allowing more time for the MS4 long-term, BMP, source control program approach to take place for controlling pollutants in stormwater discharges.

We recommend that the rule be revised to provide a longer compliance schedule and to provide more flexible regulatory relief for MS4 dischargers who have fully complied with the MEP discharge standards but cannot achieve compliance within the established compliance schedule. At a minimum, the CTR should follow the recommendation of the State Task Force on the Inland Surface Water Plan to provide a 15-year compliance schedule.

Comment: 8. The proposed rule provides only a five-year compliance schedule to achieve compliance with the proposed water quality criteria. Again setting aside the issue of whether water quality standards actually apply to municipal stormwater discharges, municipal stormwater programs are long term BMP based programs. The proposed rule fails to recognize this, addressing all wet weather discharges together in one discussion. Municipal stormwater programs should be discussed and treated separately from all other wet weather and point source discharges. These are unique programs and cannot be placed in a "one-size fits all" regulatory program. The proposed rule needs to account for the nature of stormwater discharges by allowing more time for the MS4 long-term, BMP, source control program approach to take place for controlling pollutants in stormwater discharges.

The compliance schedule in the proposed rule discourages a watershed approach to improving water quality. The development and implementation of a watershed plan requires many years and many stakeholder involvements. However, the short compliance schedule in the CTR would actually encourage the discharger to forgo the watershed approach and address its toxicity issues separately and more expeditiously.

Recommendation: The rule should allow the State to establish compliance schedules. Short of this flexibility, the rule should be revised to provide a longer compliance schedule and to provide more flexible regulatory relief for MS4 dischargers who have fully complied with the MEP discharge standards but cannot achieve WQBELs compliance within the established compliance schedule. At a minimum, the CTR should follow the recommendation of the State Task Force on the Inland Surface Water Plan to provide a 15-year compliance schedule. Also provisions should be made for a longer compliance schedule when dischargers use a watershed approach to control toxic pollutants.

G-03

Comment: Thirdly, I'd like to touch upon implementation of the rule. My understanding is that the state's Inland Surface Waters and Enclosed Bays and Estuaries Plan will address implementation of the CTR. With this in mind, the CTR should serve as an enabling rule and allow the state and the dischargers flexibility in the implementation of objectives contained in the rule.

As I touched upon earlier in my opening remarks, EPA has included some enabling provisions in this rule that we support, such as use and determination of mixing zones and water effects ratios. From the

stormwater perspective, we believe other important enabling provisions must be included to allow for regional flexibility in the implementation of our stormwater programs.

For example, enabling provisions should be included to allow flexibility in establishing compliance schedules for stormwater discharges and should allow flexibility for site-specific establishment of low-flow conditions and wet weather standards, and ranges of human health criteria depending on the use of individual receiving waters.

Response to: CTRH-001-034b

With respect to compliance schedules see response to CTR-030-004c.

The final CTR also provides flexibility for site-specific flow conditions. EPA notes that the State of California may develop alternative design flows for its waters provided that those alternative flows are scientifically defensible and protective of the designated uses of State waters. Such alternative flows will be subject to EPA review and approval. However where the State has not adopted low flow provisions, the design flows specified in today's rule shall be implemented to ensure that the criteria will be implemented appropriately to provide environmental and human health protection.

As noted in the preamble of today's rule, EPA's Technical Support Document for Water Quality-based Toxics Control (the TSD) also recommends the use of dynamic models to perform wasteload allocations. EPA is clarifying that today's rule provides the State of California with the flexibility to utilize dynamic models in establishing low flow designs. The dynamic modeling techniques, as outlined in the TSD, will enable the determination of wasteload allocations that will meet the criteria in today's rule without using a single, worst-case concentration based on a critical condition.

EPA disagrees that it must or should establish ranges of criteria depending on the use of individual receiving waters. In establishing water quality criteria for California, EPA is implementing section 303(c)(2)(B) of the CWA which requires adoption of criteria for all priority toxic pollutants for which EPA has issued criteria guidance and for which the discharge of such pollutants could reasonably be expected to interfere with the designated uses adopted by the state. EPA based the criteria contained in the CTR on its recent national criteria guidance, which are designed to protect aquatic life and human health. As long as a waterbody currently has a designated use for the protection of aquatic life and/or human health, application of the section 304(a) criteria is appropriate for fulfilling section 303(c)(2)(B). As a policy matter, EPA believes that the CTR, a massive undertaking in and of itself, is an essential first step toward reinstating a strong water quality program in California. Under the CWA, EPA has no obligation to develop such site-specific criteria or the data upon which such site-specific criteria would be based. If, however, the State wishes to develop site-specific criteria or to change the uses of the waterbody, pursuant to the regulations at 40 CFR Part 131, EPA would consider and possibly approve such a site specific criterion.

Comment: The last thing, the proposed rule provides only a five-year compliance schedule for a discharger to achieve the proposed criteria. Municipal stormwater programs are long-term programs that could take many years to fully implement and to realize any water quality benefits. Limiting municipal stormwater discharges to a five-year compliance schedule is inappropriate and impracticable.

The preamble to the proposed rule addresses all wet weather discharges. This should be discussed and treated separately from all other weather and point sources charges. These are unique programs and cannot be placed in a one size-fits-all category. The proposed rule needs to account for the nature of stormwater discharges but needs to allow a longer compliance schedule to account for the long-term BMP source control program approach. The proposed rule and corresponding compliance schedule discourages a watershed approach to improving water quality. The development and implementation of a watershed plan requires many years and various involvement. However, the CTR with a short compliance schedule would actually encourage the watershed approach and address toxicity issues separately and a little more expeditiously. The CTR should follow the recommendations of the State Task Force on the Inland Surface Water Plan than propose a 15-year schedule for full compliance.

Again, we'll be following up with written comments covering our oral testimony today. Thank you.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

1. Concern: The Rule, as presently proposed, appears to require discharges from municipal stormwater programs to meet water quality based effluent limits (WQBELs).

* Attaining sufficient pollutant reduction through source control and other reasonable measures can be infeasible because many sources of pollutants are extremely difficult or impossible to control. This situation is illustrated by the Sacramento Stormwater Management Program's recent experience in evaluating sources of lead in Sacramento County. This past year the Sacramento Stormwater Program conducted an intense effort to evaluate lead, an identified high priority stormwater constituent of concern for the Program. A major part of the effort was to identify all potential sources of lead to stormwater. Approximately 50 individual sources of lead were identified. The next step was to determine which of these sources could be controlled considering the nature of the sources, practicality of controlling the sources, legal jurisdiction of the permittees, etc. Only a portion of the sources identified could be addressed through source control and BMPs. Some examples of sources that are difficult or impossible to control are: naturally occurring lead in soil, aircraft fuel (which does not come in unleaded form), automobile emissions (which still contain some lead), abrasion of road striping paint, and abrasion of tires.

Comment: Thank you for the opportunity to comment on the proposed California Toxics Rule. The City's comments are related to five main concepts:

2. Scientific data is lacking to show that impairments to waters of the United States are occurring during storm events.

Response to: CTR-096-002

Every two years, the California State Water Resources Control Board (SWRCB) submits a report on the State's water quality to the U.S. EPA pursuant to Section 305(b) of the Federal Clean Water Act. These reports present water quality assessment information compiled by California's nine Regional Water Quality Control Boards. SWRCB (1996) indicates that urban runoff and storm sewers are major and moderate sources of impairment of beneficial uses in estuaries, lakes and reservoirs, rivers and streams, and wetlands. The extent of this impairment is shown in the table below.

Sizes of Waters Impaired by Urban Runoff and Storm Sewers by Contribution to Impairment

Waterbody Type (Units)	Major^1	Moderate and Minor^2
Estuaries(Acres)	899	52,552
Lakes and Reservoirs (Acres)	120,320	7,985
Rivers and Streams (Miles)	92	1,620
Wetlands, Freshwater (Acres)	1	58,316
Wetlands, Tidal (Acres)	0	184

Source: SWRCB (1996).
1. A major contributor is a source that is either the only one responsible for nonsupport of any designated use or it predominates over other sources.
2. A moderate contributor is a source that is the only one responsible for partial support of any use, predominates over other sources of partial support, or is one of multiple sources of nonsupport that have a significant impact on designated use attainment. A minor contributor is a source that is one of multiple sources responsible for nonsupport or partial support and is judged to contribute relatively little to this nonattainment.

Comment: EPA SHOULD ADDRESS ALL OF THE FACTORS THAT THE STATE WOULD ADDRESS UNDER THE PORTER COLOGNE ACT IN ESTABLISHING AN IMPLEMENTATION POLICY FOR MS4S

In promulgating water quality standards, EPA "is subject to the same policies, procedures, analyses, and public participation requirements established for States . . . ." 40 C.F.R. Section 131.22(c). If EPA is to stand in the shoes of the State Board in this activity, it needs to address the fundamental statutory criteria for basin plan amendments, which limits the Regional Board to adopting only those objectives that "will ensure the reasonable protection of beneficial uses and the prevention of nuisance . . . [taking into account] . . . economic considerations . . . [and] the need for developing housing within the region." Water Code Section 13241.

Under state law, the definition of water quality objectives incorporates this requirement of reasonableness, by defining objectives to mean "the limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area." Water Code Section 13050(h).

All basin plans must implement the basic policies of Water Code Section 13000, which states that "activities and factors which may affect the quality of the waters of the state shall be regulated to attain the highest water quality which is reasonable, considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible."

At the permitting stage, water code Section 13263(a) provides for the case-by-case consideration of site specific beneficial uses and objectives in every instance: "(discharge requirements] shall take into consideration the beneficial uses to be protected, the water quality objectives reasonably required for that purpose . . . and the provisions of Section 13241."

Even if EPA considers itself exempt from the application of these provisions of the Porter Cologne Act when it adopts water quality standards for California, by including inflexible standards that do not allow for the future consideration of costs as required by Section 13241, EPA is putting the Regional and State Boards on a collision course with these requirements when future Basin Plan and permitting decisions are made. Adequate flexibility must be included in the regulation, at minimum by preserving existing basin plan and State Board implementation policies, so that these state law requirements can be satisfied when basin planning and permitting decisions are made in the future.

Response to: CTR-001-010

EPA disagrees with this comment. EPA must adopt criteria in accordance with the requirements of the CWA. The quoted regulation means that EPA will follow the same policies, procedures, analyses, and public participation requirements as it requires for states under the CWA. The regulation does not mean that the CWA's provisions are negated by state law. As EPA explained in the CTR response to CTR-042-007a, while economic factors may be considered in designating uses, they may not be used to justify criteria that are not protective of those uses. As a Federal agency, EPA is not subject to the requirements of the Porter-Cologne Act.

The CTR does not interfere with the State's discretion to develop implementation policies including basin planning activities and permitting decisions. Federal law does allow the State to consider economics in decisions regarding changes in designated uses and variances.

Comment: Please find enclosed an original and two copies, and a computer disk, of my comments on the draft "US EPA 40 CFR Part 131 Water Quality Standards for the State of California" as proposed on Tuesday, August 5, 1997. As indicated, I find significant problems with the proposed approach set forth in the draft CTR for regulating some "toxics" in California waters. I also find problems with some of the criteria in that they do not represent the information on the constituents' potential impacts on the beneficial uses of waterbodies. If adopted as proposed, the CTR will lead to massive waste of public and private funds in the construction of unnecessary treatment works for domestic and industrial wastewaters and especially urban and highway stormwater runoff, in an effort to try to meet water quality standards based on the CTR proposed criteria in discharges and ambient waters without a significant improvement of real water quality/beneficial uses of waterbodies of concern to the public who must pay for the over-regulation. The proposed CTR fails to address the most important cause of real ambient-water toxicity in California, organophosphate pesticides in urban and agricultural stormwater runoff. The Agency needs to shift its toxics control program from control of chemical constituents that in some situations can be toxic, to the control of ambient water toxicity in ambient waters.

Response to: CTR-061-001

EPA disagrees. The CTR establishes the pollutant levels in ambient waters necessary to protect beneficial designated uses. Establishing numeric criteria for ambient water bodies does not limit the discretion of the permit writer to use appropriate and flexible tools such as mixing zones or translators for dissolved metals in establishing effluent limits. In addition, if a discharger believes the CTR criterion is inappropriately restrictive or overprotective of the designated use, the discharger can request the State and EPA to approve a site-specific criterion or to downgrade the designated use.

Comment: SIGNIFICANT ECONOMIC IMPACTS WOULD RESULT FROM THE APPLICATION OF WATER QUALITY STANDARDS AS NUMERIC EFFLUENT LIMITATIONS OR WASTELOAD ALLOCATIONS

If EPA intends that the WQS have a more direct effect on the permitting for MS4s, the implications are significant. in particular, the economic analysis supporting the proposed CTR would be dramatically incomplete. Massive expenditures would be required if storm water systems essentially were required to meet the same numerically based treatment standards as being considered for POTWs. The expenditures that would result from such an approach are being addressed in more detail in other MS4 comments, and will not be repeated here.

However, we note that the economic impact analysis that EPA prepared to support the proposed rule assumes that the regulation would have no economic impact on MS4s. (*11) If MS4s are subjected to NELs or WLAs as a result of the rule, significant economic impacts would result. Even if water quality based effluent limitations are based on BMPS, they would have an economic impact if they represent controls more extensive than the maximum extent practicable criteria of Section 402(p). EPA's economic analysis also provides no basis for estimating the costs to MS4s, since the "representative" dischargers analyzed in the economic analysis do not include any storm water systems. The economic analysis does not include these costs and it would be arbitrary to adopt a rule that would have these implications without considering those costs. (*12)

(*11) Likewise, the economic analysis supporting the State Implementation Policy excluded consideration of the costs to municipal storm water systems, on the theory that "the proposed Policy does not impose new regulatory requirements and, therefore, no additional costs are anticipated (i.e., . . . storm water . . .)" SIP at VIII-33. Elsewhere the SIP urges that: "The SWRCB is making no changes in the existing storm water program at the SWRCB and RWQCB. For these reasons, this cost analysis did not consider the storm water proposed Policy issue." Id. at VIII-43. These municipal costs were excluded even though the benefits calculations assumed that the proposed water quality standards would be achieved and that, with respect to San Francisco Bay, the share of toxic loadings attributable to nonpoint sources is estimated to range from 90% to 99% of the total. SIP at VIII-25. It is fundamental that "you can't get something for nothing" and the conflicting assumptions in the SIP, which parallel assumptions in the economic analysis of the CTR, are simply arbitrary.

(*12) Also, since EPA stands in the shoes of the state in adopting these criteria the action would violate the cost balancing elements of the Porter Cologne Act, as discussed below. At minimum, to the extent

that the rule creates an inflexible obligation to implement the criteria with respect to MS4s without complying with Porter Cologne Act requirements, it would set the State and Regional Boards on a collision course with those requirements at the Basin Plan and NPDES permitting phases.

Response to: CTR-001-007

EPA did not ascribe benefits or costs of controlling storm water discharges in the proposed or final Economic Analysis. EPA believes that many storm water dischargers can avoid violation of water quality standards through application of best management practices that are already required by current storm water permits. This conclusion is supported by EPA's analysis of the data submitted by several commenters (see response to CTR-040-004). EPA articulated its position on the use of BMPs in storm water permits in the Interim Permitting Approach for Water Quality Based Effluent Limitations in Storm Water Permits (61 FR 43761, August 19, 1996).

The commenter claims that even with the application of current BMPs, its storm water dischargers would still violate water quality standards due to the CTR criteria. The commenter appears to assume that the storm water discharge would be subject to numeric water quality based effluent limits which would be equivalent to the criteria values and applied as effluent limits never to be exceeded, or calculated in the same manner that effluent limits are calculated for other point sources, such as POTWs. The commenter then appears to assume that such WQBELs would then require the construction of very costly end-of-pipe controls.

EPA contends that neither scenario is valid with regards to developing WQBELs for storm water discharges or establishing compliance with WQBELs. EPA acknowledges that wet weather discharges are technically difficult to model and evaluate financially, because they are intermittent and highly variable. Wet weather discharges also occur under more diverse hydrologic or climatic conditions than continuous discharges from industrial or municipal facilities, which are evaluated under critical low flow or drought conditions. If the EPA had enough data to completely characterize all the conditions and do the necessary modelling, WQBELs would be developed using dynamic models to account for the intermittent loadings and exposures from the storm water discharges. In the absence of this data, EPA will continue to advocate the use of BMPs, as discussed in the CTR preamble. Therefore, EPA believes there is inadequate information at the current time to conclude whether the CTR will have any cost impact on storm water dischargers. Until that information is available, it is premature to project that storm water dischargers would be subject to strict numeric WQBELs and would incur any costs beyond those for which they are already legally responsible under the Clean Water Act. EPA will continue to work with the State to implement storm water permits that comply with water quality standards with an emphasis on pollution prevention and best management practices rather than costly end-of-pipe controls.

See also response to CTR-040-004.

EPA disagrees that the CTR must meet the requirements of the Porter Cologne Act. As a Federal agency, EPA is not subject to the requirements of the Porter-Cologne Act, which is State law. See also response to CTR-020-002 (Category C-21; Legal Issues).

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

3. The economic analysis used by The USEPA is flawed and inadequately addresses the impacts of the CTR on the stormwater-regulated community. Again, setting aside the issue of WQBELS for MS4s, the economic analysis is inadequate. Under Executive Order 12866, the USEPA must determine whether the CTR is "significant" and subject to OMB review. One of the criteria in assessing whether a proposed regulation is significant is to determine if it has an adverse affect resulting in an annual cost of $100 million or more. To address this criterion, the USEPA estimated the cost and benefit of the proposed regulations. Based on this analysis, the USEPA determined that the CTR was not a "significant regulatory action."

In its economic analysis, the USEPA's entire focus of the compliance cost was on the point sources which included Public-Owned Treatment Works (POTWs), industrial treatment facilities, and industrial users discharging to POTWS. A major omission in the USEPA analysis is the cost for the stormwater program to comply with the proposed criteria.

In its analysis, the USEPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP Program (over and above what an MS4 has in place already). This assumption appears to be applied to both municipal and industrial stormwater interests. We point to studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control district which show this to be incorrect, i.e., a BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost for a BMP program is significant and would increase substantially if an MS4 was required to construct end-of-pipe treatment for compliance.

It may be argued that an MS4 would seek regulatory relief from the criteria before incurring the cost of end-of-pipe treatment. While this is probably a reasonable assumption, the economic analysis failed to address the cost for either treatment, BMP program, or regulatory relief for MS4s. As a result, the overall cost for compliance is significantly underestimated. By assigning zero cost to the MS4s for compliance, the cost benefit analysis is severely flawed.

We recommend that the USEPA not implement the proposed criteria to MS4 discharges without an adequate economic analysis addressing the true impacts to MS4 dischargers is conducted and assessed.

Response to: CTR-013-003

EPA disagrees with the comment that its economic analysis is flawed or incomplete.

EPA did not include benefits or costs of controlling storm water discharges in the proposed or final Economic Analysis. EPA believes that many storm water dischargers can avoid violation of water quality standards through application of best management practices that are already required by current

storm water permits. This conclusion is supported by EPA's analysis of the data submitted by several commenters (see response to CTR-040-004). EPA articulated its position on the use of BMPs in storm water permits in the Interim Permitting Approach for Water Quality Based Effluent Limitations in Storm Water Permits (61 FR 43761, August 19, 1996).

The commenter claims that even with the application of current BMPs, its storm water dischargers would still violate water quality standards due to the CTR criteria. The commenter appears to assume that the storm water discharge would be subject to numeric water quality based effluent limits which would be equivalent to the criteria values and applied as effluent limits never to be exceeded, or calculated in the same manner that effluent limits are calculated for other point sources, such as POTWs. The commenter then appears to assume that such WQBELs would then require the construction of very costly end-of-pipe controls.

EPA contends that neither scenario is valid with regards to developing WQBELs for storm water discharges or establishing compliance with WQBELs. EPA acknowledges that wet weather discharges are technically difficult to model and evaluate financially, because they are intermittent and highly variable. Wet weather discharges also occur under more diverse hydrologic or climatic conditions than continuous discharges from industrial or municipal facilities, which are evaluated under critical low flow or drought conditions. If the EPA had enough data to completely characterize all the conditions and do the necessary modelling, WQBELs would be developed using dynamic models to account for the intermittent loadings and exposures from the storm water discharges. In the absence of this data, EPA will continue to advocate the use of BMPs, as discussed in the CTR preamble. Therefore, EPA believes there is inadequate information at the current time to conclude whether the CTR will have any cost impact on storm water dischargers. Until that information is available, it is premature to project that storm water dischargers would be subject to strict numeric WQBELs and would incur any costs beyond those for which they are already legally responsible under the Clean Water Act. EPA will continue to work with the State to implement storm water permits that comply with water quality standards with an emphasis on pollution prevention and best management practices rather than costly end-of-pipe controls.

With respect to the studies conducted by the County of Sacramento and Fresno Metropolitan Flood district see response to CTR-040-004.

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

8. The proposed rule applies to all current and future MS4 dischargers, including small communities.

The small communities will be significantly impacted by the proposed rule. In Los Angeles County, 77 of the 85 co-permittee cities are communities with a population of less than 100,000. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies, however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities, however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule(*2), it indicates that there are no small entities to be impacted by the rule and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Therefore, unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: 3. The economic analysis used by the USEPA is flawed and inadequately addresses the impacts of the CTR on the stormwater-regulated community. The USEPA's economic analysis focused entirely on the compliance cost of point sources, which included Public Owned Treatment Works (POTWs), industrial treatment facilities, and industrial users discharging to POTWs. A major omission in the USEPA analysis is the cost for the stormwater program to comply with the proposed criteria.

In its analysis, the USEPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP Program (over and above what an MS4 has in place already). Studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control district shows this to be incorrect, i.e., a BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost for a BMP program is significant and would increase substantially if an MS4 was required to construct end-of-pipe treatment for compliance. The USEPA should not implement the proposed criteria to MS4 discharges until such time as an adequate economic analysis addressing the true impacts to MS4 dischargers is conducted and assessed.

Comment: 4. The proposed rule applies to all current and future MS4 dischargers, including small communities. These small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule(*1) it indicates that there are no small entities to be impacted by the rule, and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase 11. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Thank you for this opportunity to comment on the proposed CTR. Respectfully,

Lisa Ann Rapp Director of Public Works

Comment: I would like to take this opportunity to submit in writing the specific concerns of the municipal stormwater program in Ventura County that I expressed on September 18, 1997 at the Public Hearings on the subject proposed rule.

In August of 1994, a countywide municipal NPDES permit was issued to the Ventura County Flood Control District, the County of Ventura and the ten cities in Ventura County. We are now entering the fourth year of our permit term.

At the time the eleven municipalities in Ventura County applied for the stormwater permit, only three were actually required to do so. The other eight entered the program voluntarily. In reality, five of these co-permittees would not even be required to be covered under Phase II, since their populations range from 8 to 30,000.

The Ventura Countywide Stormwater Quality Management Program was formulated to achieve compliance with the maximum extent practicable discharge standard through the use of Best Management Practices (BMPs). While the primary goal and driving force of the program is to achieve compliance with water quality standards, the economic and technological feasibility of achieving all of the proposed criteria is not practical given the diverse nature of an urbanized area, the number of discharge points and the numerous sources of pollutants for urban runoff.

Under our monitoring program, we have collected urban runoff water quality data for the past four years. The attainability analysis-using this data has indicated that even if a BMP program was fully implemented at exorbitant expense, we may not be able to achieve compliance with proposed criteria for copper, lead, zinc, thallium, nickel, and silver.

The alternative to BMP implementation would be to collect and treat stormwater discharges. Stormwater regulations make it clear that municipal stormwater permits are to implement programs to address the sources of pollutants, not to provide end of pipe treatment.

Although the cost of compliance with this rule will significantly impact all communities, the cost could be even more significant and prohibitive for the smaller ones that have made a proactive choice to apply for permit coverage. Currently, in Ventura County, we are spending approximately $5.00 per capita to implement a BMP based program. Yet the economic analysis concludes that the maximum cost of implementing the California Toxics Rule in California, for all dischargers, will be approximately $2.50 to $3.00 per person. We believe that the economic analysis for the proposed rule has not accurately evaluated the financial impact to municipalities, particularly the smaller ones.

Thank you for the opportunity to provide comments to the proposed rule. If you have any questions or would like to discuss these comments further, feel free to call me at (805)654-2040,

Comment: We recognize that the basic purpose for the proposed rule is to establish water quality criteria for priority toxic pollutants for point source discharges. However, in proposing to extend that criteria to storm water discharges, it is clear that EPA has not fully assessed the potential impact of such an extension on local governmental agencies, nor the complete lack of feasibility of attempting to apply numeric effluent standards to discharges to municipal separate storm sewer systems ("MS4s"), or the enormous cost of such an effort which would potentially require a complete reengineering and if not reconstruction of MS4s in California to include end-of-pipe treatment.

Our comments should be considered in the proper context. The cities which we represent are acutely aware of the problems associated with pollution from... urban runoff. Their residents and businesses share a common concern to preserve and enhance the water quality of our bays, rivers, estuaries and the Pacific Ocean. Our cities are fully committed to doing what they reasonably can to achieve these objectives. Our cities have been working with staff of the State Water Resources Control Board ("SWRCB") and its Regional Water Quality Control Boards ("RWQCB's") to develop effective storm water management programs under current municipal NPDES permits which comply with state and federal law. However, the proposed rule does not appear to reflect or recognize that individual cities'

fiscal and administrative resources for implementing unfunded mandates are limited. Of all governmental agencies in California involved in the process, the many small cities which we represent are the least suited to bear the brunt of the responsibility for controlling pollution from urban runoff.

The primary portion of the proposed rule that has caused concern among our cities is the statement at pages 42186-42187 of preamble that:

"When this rulemaking is complete, these criteria will be used to determine water-quality standards in California and will therefore be the basis of WQBELs in NPDES permits for wet weather point sources. However, EPA recognizes that it is commonly infeasible to express WQBELs as numeric limits for wet weather discharges and that in such cases best management practices ("BMPs") may serve as WQBELS. (Emphasis added.)

Our concern is further heightened by the comment at page 42187 of preamble that:

"It is therefore anticipated that WQBELS, including those necessary to meet the criteria set forth in this proposed rule, will be expressed as BMPs in wet weather dischargers' NPDES permits, when the permitting authority determines that it is infeasible to express WQBELS as numeric limits." (Emphasis added.)

The comments appear to indicate that in any further municipal NPDES permitting situations, the proposed rule potentially can be interpreted to require the implementation of WQBELs unless an analysis is prepared determining the infeasibility of each of the WQBELs as numeric limits.

As applied to storm water discharges, WQBELs are almost by definition infeasible. It should also be kept in mind that it is not the cities themselves that are the sources of stormwater pollution; municipal facilities have not been identified, to our knowledge, as being significant sources of contaminated urban runoff. Rather, the sources of this type of pollution, to the extent they can be identified, appear to be primarily the result of hydrological changes brought about by urbanization. These are activities over which cities have very little practical control. Nevertheless, the cities and counties of California are bearing the full and financially unassisted responsibility of ending stormwater pollution themselves.

We agree with the comments of the County of Los Angeles and the ACCWP that EPA's effort to apply numeric effluent limits to municipal storm water discharges is in direct conflict with the plain language of Congress in adopting the "maximum extent practicable" standard for controlling pollution in storm water discharges to a MS4. The proposed rule as applied to wet weather flows is also clearly inconsistent with both the EPA Is and the SWRCB's approach of addressing this problems through the adoption of Best Management Practices ("BMP's").

As noted in the SWRCB's own Municipal Storm Water Best Management and Practices Guidebook, "the sources of storm water pollution are extensive, ill-defined and highly variable." The State Board previously determined in its order entitled "In the Matter of Petition of Natural Resources Defense Council, Inc. for Review of Waste Discharge Requirements Order No. 90-079," Order No. WQ 91-04 (May 16, 1991), that:

"We find here also that the approach of the Regional Board requiring the dischargers to implement a program of best management practices which will reduce pollutants and runoff and prohibiting non-storm water discharges, is appropriate and proper. We base our conclusion on the difficulty of establishing numeric effluent limitations which have a rational basis, the lack of technology available to treat storm water discharges at the end of the pipe, the huge expense such treatment would entail, and the level of

pollutant reduction which we anticipate from the Board's regulatory program. We feel compelled to note here our agreement with the Regional Board that this permit does truly represent a massive undertaking." (Emphasis added.)

As discussed in detail in the technical comments filed in response to the proposed rule, the EPA has not explained how the proposed numeric effluent guidelines can be achieved through the implementation of BMP's. Under the circumstances, the ultimate result of the application of the rule to storm water discharges would be end of pipe treatment controls.

However, the EPA has already recognized, as the SWRCB, that end of pipe treatment controls for storm water discharges are technically unfeasible and unreasonable. The EPA has recognized that "it was not the intent of Congress to acquire municipal permits to required end of pipe treatment technology but to implement a comprehensive stormwater management program to reduce the discharge of pollutants from municipal storm sewer systems." 55 Fed.Reg., p. 48038 (November 16, 1990).

Each of our cities strongly believe that the proposed rule must be modified to clearly state that numeric effluent guidelines do not and will not apply to discharges to the municipal separate sewer systems.

Comment: UNFUNDED MANDATED PROGRAMS

One of the express purposes of the Unfunded Mandates Reform Act of 1995 is "to end the imposition, in the absence of full consideration of Congress of Federal mandates on State, local and tribal governments without adequate Federal funding, in a manner that may displace other essential State, local and tribal governmental priorities." 2 U.S.C. section 1501(2). The proposed rule in its current form seems to have been drafted without regard to its fiscal impact on cities. The rule could require treatment of storm water discharges, despite the fact that no funding mechanism, nor any assistance, financial or otherwise, is being provided to the cities by either USEPA or the State of California. If the USEPA wishes to impose these treatment programs, it needs to provide funds to pay for their implementation.

We believe that USEPA's analysis under the Unfunded Mandates Reform Act of 1995 that the CTR will not result in an expenditure in the aggregate of more than $100,000,000.00 a year is wrong. As pointed

by other local government entities which have submitted comments, the USEPA appears to assume that a BMP program will lead to compliance with numeric effluent guidelines and that there will be no associated additional costs for the BMP program. However, the economic analysis does not appear to analyze the potential cost of end of pipe treatment controls and analyze in any sort of detail what sort of BMP's would be necessary to achieve numeric effluent guidelines for the toxic pollutants. The economic analysis itself acknowledges that under its existing NPDES stormwater permit, the cities and counties of the Los Angeles area plan to spend $15,000,000 annually on public education in a program to curb illegal dumping. That cost estimate was based upon the analysis by the SWRCB of the 1990 permit. The actual costs of implementing all of the programs under the 1990 permit have been considerably more. For example, the cost estimates prepared by the San Gabriel Valley COG in connection with the LA. County permit, estimated implementation costs at $8.98 per person per year. The City of Long Beach estimated that it was already spending, as of early 1996, $12.4 million a year and that the estimated costs of implementing the programs under the current permit adopted in July 1996 would be another $3.4 million or about $16.1 million total. That number extrapolated to approximately $38.35 per person per year. The comparative cost numbers prepared by the Santa Monica Bay Restoration Project in connection with the existing Los Angeles permit estimated an average cost of dedicated stormwater program funding of $3.34 a month per household or approximately $13.36 per person per year. Using that number as a base, a city with a population of approximately $40,000 people can expect to spend $500,000 a year under its current stormwater programs. Extrapolating those numbers over the State of California, it is quite clear that the costs of implementing the existing stormwater program are in the hundred of millions of dollars a year.

Considering these economic analyses, it is quite clear that the financial impact of requiring end of pipe treatment controls or other means to achieve numeric effluent guidelines would quite easily exceed $100 million a year.

The foregoing numbers, of course, do not include potential increased costs to residents, business and industry complying with the discharge prohibitions and other requirements under the City's current municipal permits nor does the EPA's economic analysis calculate the potential costs to regulated dischargers, that is, business and industries required to either obtain an individual NPDES stormwater permit or who are covered under a general permit by filing a notice of intent.

Necessarily, the expenditure of such large amounts of money is an important public policy question, particularly in a situation where neither the State of California nor the federal government has been willing to provide any meaningful source of funds to local agencies to carry out these programs.

Comment: THE PROPOSED RULE DOES NOT COMPLY WITH THE REGULATORY FLEXIBILITY ACT

USEPA's analysis under the Regulatory Flexibility Act and Executive Order No. 12866 that the CTR will not affect a significant number of small entities is simply wrong. Most of the cities which we represent have populations of less than 20,000; many have less than 10,000. As noted by the County of Los Angeles, 77 of the co-permittee cities have populations of less than 100,000. Many of these cities are primarily residential and with limited tax revenues. Nevertheless the proposed CTR would impose the same financial requirements on these cities as would be imposed on larger entities. These cities do not receive funds from either the State of California or the federal government for their storm water programs or other urban runoff control measures.

Response to: CTR-019-003a

EPA believes it properly described the potential impact of the implementation of the CTR on storm water discharges in the preamble to the proposed CTR and in its Economic Analysis (for further discussion see responses to CTR-013-003 and CTR-040-004). EPA believes it is in full compliance with its legal obligations under Executive Order 12866 (see response to CTRH-002-006a; Category I: Stormwater/Wet Weather Flows), the Regulatory Flexibility Act (see response to CTR-013-008b).

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and with an expectation that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit and with the same expectation, Sunnyvale would like to make the following points on its own behalf:

3. Failure to Address Important Stormwater-Related Issues. In addition to its POTW, Sunnyvale is the

owner of a system of storm drains which contribute wet weather flows to the South Bay. We are concerned that the EA entirely neglects the potential impacts of the proposed CTR on the storm drains. The EA entirely omits any meaningful analysis of the costs of bringing storm drains into compliance with the proposed CTR, thereby significantly understating the overall costs of the CTR. We believe that this omission is violative of the Agency's legal obligations under the authorities cited in the preceding paragraph.

In addition, we join in the comments being filed by the various other operators of stormwater collection systems to the effect that EPA has overstated the legal requirements for storm drains to comply with numerical criteria.

Response to: CTR-021-006a

EPA believes it properly described the potential impact of the implementation of the CTR on storm water dischargers in the preamble to the proposed CTR and in its Economic Analysis (for further discussion see responses to CTR-013-003 and CTR-040-004). EPA believes it is in full compliance with its legal obligations under Executive Order 12866 (see response to CTRH-002-006a; Category I: Stormwater/Wet Weather Flows), the Regulatory Flexibility Act (see response to CTR-013-008b), and the Unfunded Mandates Act (see preamble to the final rule).

Comment: 3. The economic analysis used by The USEPA is flawed and inadequately addresses the impacts of the CTR on the stormwater-regulated community. The USEPA Is economic analysis focused entirely on the compliance cost of point sources, which included Public Owned Treatment Works (POTWs), industrial treatment facilities, and industrial users discharging to POTWs. A major omission in the USEPA analysis is the cost for the stormwater program to comply with the proposed criteria.

In its analysis, the USEPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP Program (over and above what an MS4 has in place already). Studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control district shows this to be incorrect, i.e., a BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost of a BMP program is significant and would increase substantially if an MS4 was required to construct end-of-pipe treatment for compliance. The USEPA should not implement the proposed criteria to MS4 discharges until such time as an adequate economic analysis addressing the true impacts to MS4 dischargers is conducted and assessed.

Comment: 4. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule(*1), it indicates that there are no small entities to be impacted by the rule, and therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: 3. The economic analysis used by USEPA is flawed and inadequately addresses the impacts of the CTR on the stormwater-regulated community. Again setting aside the issue of WQBELs for MS4s, the economic analysis is inadequate. Under Executive Order 12866 USEPA must determine whether the CTR is "significant" and subject to OMB review. One of the criteria in assessing whether a proposed regulation is significant is to determine if it has an adverse effect resulting in an annual cost of $100 million or more. To address this criterion USEPA estimated the cost and benefit of the proposed regulations. Based on this analysis USEPA determined that the CTR was not a "significant regulatory action".

USEPA used two different economic models in assessing the CTR. The model that proved more applicable consisted of an analysis that focused on direct compliance costs (such as capital costs and O&M for end-of-pipe control, indirect source control, (e.g. pretreatment programs) pollution prevention, monitoring and costs for pursuing alternative methods of compliance). However, the entire focus of the compliance cost was on the point sources with individual NPDES permits, which included Public Owned Treatment Works (POTWs), industrial treatment facilities, and industrial users discharging to POTWS. A major omission in USEPA's analysis is the cost for the stormwater program to comply with the proposed criteria.

In its analysis USEPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP program (over and above what an MS4 has in place already). This assumption appears to be applied to both municipal and industrial stormwater interests. We point to studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control District which show this to be incorrect, i.e. an aggressive BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost for an aggressive BMP program is significant and would increase much more substantially if an MS4 was required to construct end-of-pipe treatment for compliance.

It may be argued that an MS4 would seek regulatory relief from the criteria before incurring the cost of end-of-pipe treatment. Even assuming such relief would be forthcoming, the economic analysis failed to address the cost for treatment, or for a BMP program, or for seeking regulatory relief for MS4s. As a result the overall cost for compliance is significantly underestimated. By assigning zero cost to the MS4s for compliance, the cost benefit analysis is severely flawed.

Recommendation: USEPA should not implement the proposed criteria until such time an adequate economic analysis addressing the true impacts to MS4 dischargers is conducted and assessed.

Comment: 9. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems if the proposed criteria are adopted. While most small communities have not conducted discharge characterization studies; it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless EPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule (*3), USEPA indicates that no small entities are impacted by the rule, and, therefore, USEPA did not need to complete an analysis required under the Act. USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. USEPA should have conducted an analysis on the economic impacts to smaller communities.

Recommendation: Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be promulgated until USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: 10. The proposed rule failed to address the economic impacts it may have on industrial stormwater dischargers. Industrial stormwater dischargers that are currently regulated by a stormwater permit, and all future industrial dischargers that will come into the program under Phase II will be required to comply with the proposed criteria. Cost of compliance with the proposed criteria for certain industries may be prohibitive, yet USEPA did not address this potential impact in its economic analysis. In addition many of these industries are small entities that should be addressed under the Regulatory Flexibility Act.

Recommendation: The proposed rule should not be promulgated until USEPA conducts an adequate economic analysis that addresses the economic impact the rule may have on industrial stormwater dischargers, including the impact to small industries.

Response to: CTR-027-010

EPA believes it that it has conducted an adequate analysis which addresses industrial stormwater dischargers and that the CTR must be promulgated under the Clean Water Act. For further discussion see responses to CTR-013-003 and CTR-013-008b.

Comment: The City is a small community with a population of less than 50,000. We volunteered to participate in the Sacramento Stormwater Management Program as a co-permittee on the NPDES permit because we understood that it was a BMP-based program aimed at reducing the discharge of pollutants to the maximum extent practicable. We are very concerned with the CTR's Preamble statement that municipal stormwater agencies must comply with effluent limitations based on water quality criteria. As the County has stated in its comments, this will result in enormous costs without producing significant environmental benefits.

We are also concerned that the EPA Administrator has certified that the CTR will have no effect on small entities such as the City. Based on the estimated compliance costs prepared by the County and the statewide estimates prepared by the California Storm Water Quality Task Force, the CTR will have significant economic effects on small communities throughout the State. For example, our proportional share of the countywide costs to comply with effluent limitations, based on the proposed water quality criteria, could be over $10 million per year.

We urge EPA to reconsider its position that municipal stormwater discharges must comply with water quality standards. EPA should remove the Preamble statement or clarify that municipal stormwater

discharges are only required to reduce the discharge of pollutants to the maximum extent practicable.

Alternatively, EPA must revise its economic analysis to include the costs to municipal stormwater agencies and the EPA Administrator must withdraw her certification and, pursuant to the requirements of the Regulatory Flexibility Act, assess the economic impacts of the CTR on small entities.

Comment: 2. Since the preamble implies that CTR criteria may be applied in NPDES permits for municipal storm water dischargers as numeric effluent limitations, the proposed rule is flawed with regard to: a) setting attainable, scientifically valid criteria in a manner consistent with state and federal regulatory approaches; b) assessing the potential economic impact on the public served by municipal storm water dischargers; c) assessing environmental impacts pursuant to the National Environmental Policy Act and the Endangered Species Act; and d) providing for the coordinated review and evaluation of the proposed CTR in conjunction with the proposed State Implementation Plan.

Comment: b. If the CTR as proposed in the current draft is applied to municipal storm water dischargers so as to require numeric effluent limitations in municipal stormwater permits, the cost to the public will be phenomenal. In the economic analysis of the CTR, EPA failed to consider these costs, and failed to consider the costs to industrial storm water dischargers as well.

The District Is urban storm water drainage system captures through retention 90% of its annual average runoff, and discharges 90% after detention (1% is directly discharged without treatment). The system cost in 1997 dollars is estimated at $500 million.

The only option available to the District to mitigate violations of the proposed criteria would be to expand system storage to capture 100% of average annual runoff. Increasing system storage by 20,000 acre feet (estimated additional storage required for average years), at the current cost of $11,000-$20,00 per acre foot of storage, would result in a capital expenditure of $220,000,000 to $400,000,000.

Even with this exorbitant investment, in approximately half of the rain seasons storage would be exceeded, and 100% of the discharges would be expected to exceed the dissolved metals criteria noted above.

Smaller cities (under 50,000) in California are currently subject to NPDES municipal storm water discharge permits, and many more will be included upon implementation of the Stormwater Phase II program. EPA's failure to assess economic impacts on small cities would appear to be contrary to the requirements of the Federal Regulatory Flexibility Act.

The District includes in its constituency industrial businesses. The District serves these businesses and assists in the oversight of their pollution prevention and storm water permit compliance efforts. Regardless of EPA' s approach to applying the CTR to municipal storm water permits, industrial storm water dischargers are directly and seriously affected by application of the CTR. EPA's failure to assess these economic impacts on our communities is short-sighted and a breach of good public policy.

Response to: CTR-031-006a

E-01b
E-01e
E-01v

Comment: * In general, we are pleased that EPA prepared an analysis of the economic impacts of the proposed CTR, and that a major portion of EPA's work focused on determining the potential impacts on POTWs. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Detailed comments can be found in Attachment 2. A few of the areas of concern are listed below:

* Small facilities appear to be under represented in EPA's sample of POTWS, especially for minor dischargers.

* The cost triggers used as regulatory relief thresholds are unrealistic, and are not consistent with EPA regulations and policies.

* The assumptions used to determine cost estimates for indirect dischargers appear to omit a large proportion of potentially affected industries.

* The Economic Analysis does not take into account projected population and industrial growth over time, which may influence effluent quality and quantity. Statewide, the population is projected to grow by nearly 50% by 2020.

* The use of average cost estimates masks economic impacts on individual dischargers, which may be particularly acute for small communities.

* The economic Analysis ignores the costs that may be incurred by stormwater dischargers and nonpoint sources to reduce loadings so that CTR criteria may be met in ambient waters.

Response to: CTR-034-014e

For analysis of the final CTR, EPA updated its Economic Analysis to reflect the most recent data and information for each sample facility and also increased the sample size for minor facilities. Based on this revised analysis, EPA estimated that minor POTWs will incur costs of approximately $5,000 per facility per year under the low cost scenario and $7,800 per facility per year under the high cost scenario.

EPA acknowledges that evaluating the impact of each individual direct discharger to inland waters, enclosed bays, and estuaries within the State of California would be the most accurate method to determine impacts of the CTR. However, the resources that would be required to perform such an analysis for each of the over 1,241 direct dischargers are beyond the resources typically available for development of environmental regulations. Therefore, in developing the methodology for estimating the compliance costs for the proposed CTR, time and budget constraints limited EPA's costing review to a subset of the regulated community. However, EPA believes that the sample selected adequately represents the various types of direct dischargers in the State.

EPA acknowledges that minor dischargers were sampled less frequently as compared to the major dischargers. However, by definition, under the NPDES permit program, facilities classified as minor would not be expected to discharge toxic pollutants in toxic amounts. Since the CTR addresses only

toxic pollutants, EPA would not expect significant, if any, impact to minor dischargers.

In analyses of the final CTR, EPA increased the sample of minors by five randomly selected facilities to bolster its analysis. EPA estimated costs of $872 per minor facility under the low scenario, and $2,682 per minor facility under the high scenario due to the CTR.

EPA also replaced Silvergate with South Bay in the sample in order to improve the estimate of the impacts of the CTR on the electric utility industry. The draft CTR cost analysis included costs for Silvergate, but the facility had closed and the data available was over five years old. The addition of South Bay, an electric utility facility with no costs, to the sample results in a more realistic, lower overall cost estimate for the electric utility industry.

As described in EA that accompanied the proposed CTR (SAIC and Jones and Stokes Associates, 1997), EPA assumed that regulatory alternatives such as phased total maximum daily loads/water quality assessments, site-specific criteria modifications, standards variances, metals translators, etc., are considered under certain circumstances. Specifically, under the low-end scenario, regulatory alternatives were assumed necessary if the cost for a sample facility exceeded $200 per toxic pounds-equivalent.

EPA assumes that a facility, when faced with the challenge of meeting water quality-based effluent limitations (WQBELs) based on CTR criteria, will select the most cost-effective controls, including regulatory alternatives. In fact, this has been the case in California, where several major POTWs have performed studies in pursuit of regulatory alternatives such as metals translators and site-specific criteria, rather than install costly controls to comply with WQBELs. EPA acknowledges that the actual cost-effectiveness value will vary by facility depending upon many factors, including the characteristics and volume of discharge, the receiving water, etc. However, EPA disagrees that the cost trigger is unrealistic, as it was reasonably based upon the highest reported cost-effectiveness values for industry categories subject to effluent limitations guidelines and standards.

Nonetheless, in the high-end estimate developed for the cost analysis accompanying the final CTR, no cost trigger was used and, thus, EPA's high-end cost estimate did not include the use of a regulatory alternative for any sample facility.

Reference: SAIC and Jones and Stokes Associates, Inc. 1997. Analysis of Potential Costs Related to the Implementation of the California Toxics Rule. Prepared for U.S. EPA, Office of Science and Technology and U.S. EPA Region IX, May 5.

EPA disagrees with the commenter's assertion that the costs for San Jose and Sunnyvale cannot be used to extrapolate costs to indirect users at other POTWs. The procedures for identifying indirect sources contributing specific pollutants to POTWs and developing and implementing a source control plan to minimize these discharges are similar for all types of pollutants. Additionally, similar to San Jose and Sunnyvale, metals were the primary pollutants of concern for POTWs evaluated in the cost analysis. Apart from these studies, EPA has no data upon which to establish facility-level compliance costs for indirect dischargers. To account for this uncertainty, EPA has revised its assumption regarding the percentages of indirect dischargers that may incur these costs. The percentage of facilities that may incur these costs was revised from the initial estimate of from 10% to 30% to a new estimate of from 30% to 70%. EPA believes that these new estimates are highly conservative (i.e. tend to overestimate costs).

Average per facility investment costs for industrial participants were estimated using the mass audit studies for copper and nickel pollution prevention projects with paybacks of less than five years. The average cost per indirect discharger was estimated to be $61,526 or $15,000 per year at an interest rate of

7 percent and over a period of five years. The total annual costs to the indirect discharger population in California then were estimated by multiplying the annualized cost ($15,000) by the total number of potentially affected indirect dischargers.

Under the MAS, the pounds removed by the pollution prevention projects with paybacks of less than five years were 560 pounds per year for copper and 148 pounds per year for nickel. Since neither San Jose nor Sunnyvale required nickel reductions, EPA did not consider pounds removed. Both San Jose and Sunnyvale did require copper reductions under the high-end cost analysis. For San Jose, required reductions equaled approximately 746 non-toxic-weighted pounds per year, however, for Sunnyvale, required reductions equaled 87 pounds per year. Since the industrial facilities to which the MAS results were applied are not as large as the San Jose facility (160 million gallons per day) whose reduction requirements exceed the MAS results, EPA estimated that load reductions from implementing the pollution prevention projects would be adequate.

EPA estimated annual (steady state) benefits and annualized costs. EPA also compared, 20- and 30-years streams of benefits and costs to account for differences in the schedule for experiencing benefits and costs (up-front capital cost and a phase-in of benefits). EPA did not forecast economic, demographic, or policy changes over these time periods. However, EPA does not expect changes in these variables to negatively impact the anticipated ratio of benefits and costs. Instead, EPA believes that increased population and economic activity in the future would likely increase the benefits of achieving standards for toxic pollutants in California waters compared to the cost of controls.

EPA selected sample facilities in order to represent different industry categories, but also various facility sizes with different flow magnitudes. For example, EPA analyzed POTW facilities which fell into three flow categories representing facilities serving very large, medium, and small communities. Costs were averaged for the sample facilities within each flow category for an industry type and then extrapolated to the universe of facilities which matched the industry type and the range in flow for that flow category. Thus, costs calculated for facilities operating in very large communities would not be applied to facilities serving very small communities.

EPA did not include benefits or costs of controlling nonpoint sources or storm water dischargers in its estimates of benefits and costs of the CTR. EPA believes that the final rule will not have a direct effect on sources not permitted under the NPDES program (e.g., nonpoint sources) or NPDES sources not typically subject to numeric water quality-based effluent limits (e.g., wet weather discharges). Any potential indirect effect on nonpoint sources and wet weather discharges, such as runoff from farms, urban areas, and abandoned mines, and contaminated sediment, is either unknown at this time or not a result of this rule. Many of the programs developed to control nonpoint sources and wet weather discharges are already in place. Costs due to these programs have already been incurred or will soon be incurred owing to existing federal, State, and local environmental programs that are distinct from the CTR.

EPA also acknowledges that nonpoint sources and wet weather discharges are technically difficult to model and evaluate costs because they are intermittent and highly variable. Nonpoint source and wet weather discharges also occur under different hydrologic or climatic conditions than continuous discharges from industrial and municipal facilities, which are evaluated under critical low flow or drought conditions. Thus, evaluating agricultural nonpoint source discharges and storm water discharges and their effects on the environment is highly site-specific and data intensive. Until this information is available, it is premature to project that the sources would incur any costs beyond those for which they are already responsible under current regulations of the Clean Water Act.

Comment: pp. 42188-42189 - Potential Costs Do Not Meet the $100 Million Threshold Under E 0. 12866 (also see discussion above) As noted on p. 42188, one component of the definition of a "significant regulatory action" is that the rule may have an annual effect on the economy of $100 million or more. EPA states on p.42189 that "the annualized potential costs that direct and indirect dischargers may incur as a result of State implementation of permit limits based on water quality standards using today's proposed criteria are estimated to be between $15 million and $87 million." We believe that this range significantly underestimates the potential costs that may be realized from the implementation of this rule. This belief is based on the numerous assumptions used by EPA that would have served to underestimate potential costs, including assumptions about regulatory flexibility that are clearly contradicted in the Preamble to the rule itself. These issues are further enumerated in Attachment 2, which contains an analysis prepared by the environmental economics firm, M. Cubed. Furthermore, we strongly believe that EPA has a duty to look at a full range of potential costs that may be incurred, and not just to look at the costs under optimistic assumptions. This duty is especially acute in light of the uncertainties of how the CTR will be implemented by the State.

We examined the potential costs for the POTW sector to determine the reasonableness of EPA's cost estimates. Our preliminary analysis indicates that for 23 major POTWs the annualized costs could reach $400 million.(*3) This estimate includes the cost to construct and operate end-of-pipe treatment processes where these would be necessary to achieve projected effluent limits. Unlike the EPA cost estimates, we have assumed that regulatory relief options may not be available, and that, based on the pollutants causing compliance problems, pollution prevention and treatment plant optimization might not be sufficient to reliably achieve compliance. Thus, we feel that this estimate reflects a more accurate depiction of the potential POTW "high-end" compliance costs that could result from the draft CTR. Based on this analysis, we believe that EPA should re-analyze the potential costs for POTWs to meet water quality-based effluent limits based on the criteria in the CTR.

As noted on p. ES-2 of the Economic Analysis (U.S. EPA, 1997a), EPA estimated only the costs to point sources, and did not estimate the potential costs for compliance for nonpoint source dischargers, despite the fact that the majority of water bodies in California are impaired due to nonpoint source discharges (SWRCB, 1996). In addition, EPA failed to estimate the costs of compliance for wet weather dischargers, such as municipal and industrial stormwater dischargers. These omissions also lead us to believe that the potential total costs of the rule are far greater than $100 million. EPA must correct these deficiencies and redo the Economic Analysis.

(*3) Backup information for these cost estimates is available upon request.

Response to: CTR-035-044c

In response to comments received by EPA on the economic analysis that accompanied the proposed CTR, EPA collected additional data for the sample facilities. EPA also revised its estimate of potential compliance costs attributable to the CTR.

EPA's low estimate of total annualized costs of the final CTR is $33.5 million per year and its high estimate is $61.0 million per year. The low and high estimates vary based on whether effluent data or permit limits are used to assess the need for additional controls. They also vary based on whether or not alternative regulatory approaches, such as phased total maximum daily loads/water quality assessments, site-specific criteria modifications, standards variances, metals translators, etc., are considered under certain circumstances. EPA believes that its estimates of costs and benefits are sound.

EPA believes that several general observations can be made regarding studies submitted by commenters and how they differ from the EPA cost study for the final CTR. Many commenters assumed that the mere presence of a pollutant would result in costs to comply with a CTR-based WQBEL. It should be noted that the presence of a pollutant in an ambient inland water, enclosed bay, or estuary does not require permitting authorities to establish a WQBEL for that pollutant. The establishment of a permit limit is appropriate only where the permitting authority determines that a pollutant is likely to be present, and that the pollutant concentration has a "reasonable potential" to cause or contribute to an exceedance of the applicable water quality standard. Where the pollutant is not likely to be present, or is not present at levels that have reasonable potential to cause or contribute to a water quality standard exceedance, a WQBEL may not be necessary.

The majority of cost estimates provided by commenters include the costs for the addition of end-of-pipe treatment to achieve proposed CTR-based WQBELs. This was particularly the case when WQBELs were expected to be below analytical detection levels. EPA disagrees that end-of-pipe treatment is necessary to achieve CTR-based WQBELs in all cases. As discussed in SAIC (1995), there are documented cases where waste minimization or source control techniques have been used to comply with existing permit limits established below detection levels. Other examples include the Western Lake Superior Sanitary District (WLSSD), who after evaluating the costs involved to meet more stringent WQBELs for mercury with end-of-pipe treatment, concluded that pollution prevention techniques were the preferable control strategy. As a result, WLSSD published a guide designed to "assist wastewater treatment plant staff with creating and implementing their own mercury reduction projects." As a result of the efforts of WLSSD, effluent mercury levels were found to decrease from 0.58 parts per billion (ppb) to 0.015 ppb.

Although waste minimization or source controls are not always applicable, EPA assumes in its low estimate of costs that a facility would first evaluate whether process changes or modifications are feasible, prior to incurring costs for adding treatment.

In addition, many commenters assumed that compliance would be based on the WQBEL, regardless of whether it is below the analytical method detection level (MDL). This is not consistent with current practice. Instead, the State may use the "minimum level" (ML) (as defined in 40 CFR Part 136) as the required compliance point where a permit limit is established at a value below the MDL. The ML is a value at which the limited parameter can be accurately quantified, and is always greater than or equal to the MDL. To ensure that its cost estimates were conservative (i.e., erring on the side of higher costs),

EPA used the MDL as the compliance level. Although EPA used the pollutant MDL for costing purposes, the Agency acknowledges that estimating treatment costs for WQBELs below the MDL is speculative and likely unrealistic.

Finally, many of the commenters included costs related to installation of treatment for storm water discharges. As further described in the responses to CTR-021-008, CTR-013-003 and CTR-040-004, EPA believes that the final CTR will not significantly affect the current storm water program being implemented by the State, which includes the requirement to develop best management practices to control pollutants in storm water discharges. As such, EPA believes that inclusion of end-of-pipe treatment costs for storm water are inappropriate.

With respect to EPA's analysis of nonpoint source dischargers see response to CTR-034-014e.

Comment: Cost to Implement the Proposed Rule

The inclusion of municipal stormwater discharges under the proposed rule renders the economic analysis invalid, noting municipal studies that show that stormwater discharges cannot comply with all of the proposed criteria with anything short of major national or regional product substitutions, or end-of-pipe treatment:

The Fresno Metropolitan Flood Control District conducted an attainability analysis on stormwater discharges from its urbanized area detention basins. The analysis showed that even with pollutant reductions in the basins, the proposed criteria would not be met.

The Sacramento Stormwater Program conducted an attainability analysis and found that even with an aggressive BMP program the urbanized area would not achieve certain of the water quality criteria, and that the cost of treatment would be on the order of $2 billion.

A preliminary attainability analysis conducted by Orange County, based on a limited dataset, indicates similar findings to Fresno and Sacramento in spite of the implementation of a significant BMP program over a multi-year period (see Attachment 2).

A nationwide attainability study, conducted by American Public Works Association in 1992, estimated capital costs and annual operations costs to be $406,734,900,000 and $542,036,700,000. Significantly, these estimates omitted the costs associated with engineering, administration, permitting and land acquisition.

Even if end-of-pipe treatment were to be implemented for all urban stormwater, the contribution of toxic pollutants from this source is so minor (less than 3% according to the economic analysis) that they could not be justified by the marginal water quality benefits achieved. Clearly a rule that is known from the outset to inevitably result in massive expenditures which provide little water quality benefit or inevitable municipal noncompliance is not appropriate for California.

The rulemaking process of the federal government is obligated to fully explore the economic implications of the proposed regulatory action through compliance with Executive Order 12866, the Unfunded Mandates Report Act, of 1995 (the "Reform Act"), and the Regulatory Flexibility Act (the "RFA"). In its economic analysis EPA appears to have understated costs and circumvented these requirements resulting in a lack of disclosure of the true impacts of the Rule.

Executive Order 12866 requires any "significant" federal regulatory action to be referred to the Office of Management and Budget for review before it can be approved. In this context a "significant" action includes one which will "have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy". Though admitting that there "may be a cost to some dischargers" to comply with water quality standards which will be derived from these toxics criteria, EPA nonetheless argues that the proposed rule is not a significant action because it "establishes ambient water quality criteria which. by themselves, do not directly impose economic impacts." [62 Fed. Reg. 42188].

First nothing in E.O. 12866 indicates that only actions with direct economic impacts are to be considered by OMB. Second, for EPA to ignore the link between the toxics criteria contained in the proposed rule and the obligations they impose is unfounded.

In short, EPA cannot have it both ways. It cannot indicate that stormwater discharges are subject to the proposed toxics rule and then turn a blind eye toward the costs associated with implementation of this rule. The costs of the proposed rule are direct and significant, greatly exceeding the annual % 100 million threshold, and therefore the rule must be submitted to OMB for review.

Response to: CTR-036-002a

EPA believes it properly described the potential impact of the implementation of the CTR on storm drains in the preamble to the proposed CTR and in its Economic Analysis (for further discussion see response to CTR-013-003). With respect to the analyses by the Fresno Metropolitan Flood District and the Sacramento Stormwater program see response to CTR-040-004. EPA believes it is in full compliance with its legal obligations under Executive Order 12866 (see response to CTRH-002-006a; Category I: Stormwater/Wet Weather Flows), the Regulatory Flexibility Act (see the preamble to today's rule, response to CTR-013-008b, and CTR-050-007a), and the Unfunded Mandates Act (see the preamble to today's rule and response to CTR-036-006a).

Comment: EPA also has failed to meet its obligations under the Unfunded Mandates Reform Act of 1995 (the "Reform Act"). As with E.O. 12866, the Reform Act requires federal agencies to assess the effects of their regulatory actions on state, local and tribal governments, and on the private sector [U.S.C. section 1531]. Among other things, the Reform Act requires the preparation of a cost-benefit analysis and the examination of a range of alternatives, whenever the proposed action may result in expenditures in excess of $100 million [2 U.S.C. sections 1532, 1535]. In addition, the Reform Act contains a number of specific requirements where an action may significantly or uniquely impact small governments [2 U.S.C. section 1533].

EPA asserts again that it does not have to comply with the Reform Act because the proposed rule "imposes no direct enforceable duties on the State or any local government or on the private sector." [62 Fed. Reg 42160, 42191]. For the reasons discussed earlier, this assertion is without merit. As EPA acknowledges, these criteria will serve as the basis for any water quality standards promulgated by the State, which in turn will be binding on. local government and private industry. Unless EPA is prepared to view these criteria as being optional, it therefore cannot in good conscience state that they do not create an enforceable duty. Given this, EPA must comply with the mandates of the Reform Act

Response to: CTR-036-003b

Comment: Finally, EPA has not met its duties under the Regulatory Flexibility Act (the "RFA"). Under the RFA, federal agencies are required to conduct an initial regulatory flexibility analysis ("IRFA") describing the impact of a proposed regulatory action on small entities. Once more relying on the claim that the proposed rule does not establish criteria that are directly applicable to small entities, EPA states that the mandates of RFA do not apply [62 Fed. Reg. 41160, 42191-92].

This position is contrary to both the letter and the spirit of the RFA. The fact that the toxics criteria contained in the proposed rule must be translated into water quality standards and, in turn, NPDES permit effluent limitations, does not negate the fact that the burden of complying and implementing such toxics criteria ultimately will be borne by individual municipalities and business entities. As noted above, the costs to municipalities alone could run into billion of dollars placing a severe strain on their budgets and forcing them to divert funds currently allocated to other important municipal services, including public safety.

Moreover, EPA's statement that "California will have a number of discretionary choices associated with permit writing" is disingenuous and ironic in light of EPA's rationale for issuing the proposed rule. The toxics criteria will necessarily narrow the State's discretion in issuing NPDES permits and in establishing effluent limits for such permits. If EPA had meant for the State to have any serious discretion, it would not be promulgating these criteria in the first place.

Response to: CTR-036-004a

The purpose of the CTR is to fill the current gaps in water quality criteria in inland surface waters, enclosed bays, and estuaries. EPA disagrees that the State will not have substantial discretion in issuing NPDES permits under the rule. The CTR establishes pollutant levels necessary to protect designated uses. Establishing numeric criteria in the CTR does not limit the discretion of permit writers to use appropriate and flexible tools such as mixing zones or translators for dissolved metals criteria in establishing effluent limits. In addition, if a discharger believes the CTR criterion is inappropriately overprotective of the designated use, the discharger can request the State and EPA to approve a site-specific criterion or to downgrade the designated use.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

1. Concern: The Rule, as presently proposed, appears to require discharges from municipal stormwater programs to meet water quality based effluent limits (WQBELs).

* The enclosed attainability analysis (See Attachment A) demonstrates that implementation of an

aggressive BMP-based program will cost on the order of $20 million per year. And, despite the implementation of ever escalating BMPs, the Sacramento Stormwater Management Program will not achieve several of the proposed aquatic life criteria (for copper, lead, and zinc) and human health criteria (for PAHs).

Response to: CTR-040-004

EPA disagrees with the commenter's interpretation of the language regarding wet weather discharges in the proposed CTR, and has clarified the language in the section of the CTR that discusses the applicability of the rule to wet weather discharges. EPA believes that the CTR language allows the practice of applying maximum extent practicable (MEP) to MS4 permits, along with best management practices (BMPs) as effluent limits to meet water quality standards where infeasible or insufficient information exists to develop WQBELs.

Section 402(p)(3)(B) requires municipal separate storm water systems to 1) prohibit non-storm water discharges, and 2) reduce the discharge of pollutants in storm water to MEP. The Agency has purposely not defined MEP to allow municipalities flexibility in designing pollution control measures. MEP is a dynamic performance standard which requires the municipality to demonstrate permit compliance in many ways including the use of BMPs, proper maintenance of their BMPs, and ongoing assessment of BMP performance in reducing pollutant discharges. EPA has determined that, where sufficient information does not exist on which to base WQBELs, or where infeasible, the use of BMPs is consistent with the requirement that municipal storm water programs require controls to reduce the discharge of pollutants to MEP in order to attain and maintain water quality standards.

EPA articulated its position on the use of BMPs in storm water permits in the Interim Permitting Approach For Water Quality-Based Effluent Limitations In Storm Water Permits signed by the Assistant Administrator for Water, Robert Perciasepe on August 1, 1996 (61 FR 43761, August 19, 1996). The policy focuses on the question of the applicability of WQBELs to MS4 permits, and whether or not numeric effluent limitations are required, or could be represented by other control mechanisms such as BMPs. The policy affirms the use of best management practices as a means to attain water quality standards in storm water permits. The policy reads as follows:

In response to recent questions regarding the type of water quality-based effluent limitations that are most appropriate for National Pollutant Discharge Elimination System (NPDES) storm water permits, the Environmental Protection Agency (EPA) is adopting an interim permitting approach for regulating wet weather storm water discharges. Due to the nature of storm water discharges, and the typical lack of information on which to base numeric water quality-based effluent limitations (expressed as concentration and mass), EPA will use an interim permitting approach for NPDES storm water permits.

The interim permitting approach uses best management practices (BMPs) in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards. In cases where adequate information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate.

This interim permitting approach is not intended to affect those storm water permits that already include appropriately derived numeric water quality-based effluent limitations. Since the policy only applies to water quality-based effluent limitations, it is not intended to affect technology-based limitations, such as those based on effluent guidelines or the permit writer's best professional judgement, that are incorporated into storm water permits.

Each storm water permit should include a coordinated and cost-effective monitoring program to gather necessary information to determine the extent to which the permit provides for attainment of applicable water quality standards and to determine the appropriate conditions or limitations for subsequent permits. Such a monitoring program may include ambient monitoring, receiving water assessment, discharge monitoring (as needed), or a combination of monitoring procedures designed to gather necessary information.

This interim permitting approach applies only to EPA; however, EPA also encourages authorized States and Tribes to adopt similar policies for storm water permits. This interim permitting approach provides time, where necessary, to more fully assess the range of issues and possible options for the control of storm water discharges for the protection of water quality. This interim permitting approach may be modified as a result of the ongoing Urban Wet Weather Flows Federal Advisory Committee policy dialogue on this subject.

EPA also reviewed the attached report entitled "Technical Report Assessing the Attainability of Water Quality Criteria Proposed in the California Toxics Rule," a report prepared for Sacramento County Stormwater Management Program by Larry Walker Associates (LWA). In response, EPA has the following concerns and comments regarding various aspects of the report and its conclusions.

General Limitations of the Analysis

* LWA do not provide the raw data upon which they base their conclusions regarding potential compliance problems with the proposed CTR water quality criteria. Without the raw data, EPA could not fully assess the validity of the analysis.

* The data may not be representative of the storm water discharges to the American and Sacramento Rivers. Most samples were collected for first-flush events, usually one hour or less in duration. As a result, the in stream exposure period is probably one hour at most, which corresponds to the exposure period for acute criteria, not chronic criteria as used in the LWA analysis.

* LWA report that applying BMPs to storm water would not result in attainment of criteria as proposed in the CTR. However, LWA focus on the most stringent (and unlikely) scenario for attainability of criteria (i.e., applying chronic criteria with no allowance for dilution). According to LWA's own analysis, BMPs would nearly achieve compliance under the scenario of applying acute criteria and dilution factors to storm water flows. If mathematical errors in LWA's Table's 11 and 12 are corrected, the analysis demonstrates compliance with acute criteria for even the 99.91 percentile values of copper, lead, and zinc in the Sacramento River, and for lead in the American River, with no additional treatment.

* The analysis also may not be reflective of the compliance scenario for other California waters. The metals criteria are based on a low hardness value for the American River (25 mg/l as CaCO3). This hardness value is lower than any of the hardness values observed for the economic analysis of sample facilities throughout California. As a result, the criteria for the American River are very stringent (i.e., criteria become more stringent with lower hardness) compared to criteria for California waters in general.

* LWA compare the concentration of the dissolved fraction of metals in the discharge to the instream criterion values expressed as dissolved metals to assess compliance. This approach may be overly stringent because it does not account for the partitioning of dissolved metals present in the discharge to suspended solids present in receiving waters (particularly during a storm event when suspended solids are elevated). Thus, less dissolved metals may be available in the water column than LWA's analysis

would estimate. In addition, this is not the approach that is used to determine compliance under the NPDES program. The NPDES regulations require all permit limits for metals to be expressed in terms of "total recoverable metals" [40 CFR 122.45]. In order to determine whether a discharge would meet NPDES permit limits developed to protect water quality, the instream criteria should not be used directly, but should be converted to a water quality-based effluent limit (WQBEL) using the EPA standards-to-permits procedures. The development of WQBELs expressed as total recoverable metals accounts for the partitioning of dissolved metals (present in the discharge) to suspended solids that are present in the receiving water. EPA used this approach in its cost evaluations.

* Cost estimates provided in the LWA analysis for complying with the CTR appear to mix BMP implementation costs to comply with Sacramento's storm water permit with new compliance costs resulting from the CTR. EPA's economic analysis only evaluates the incremental impact of the water quality standards for toxics compared to the baseline program to avoid a double counting of costs (and benefits).

Specific Data and Sampling Issues

* LWA calculated average event mean concentrations (AEMC) to represent the entire urbanized drainage area of Sacramento County. Samples were combined to calculate AEMCs (based on contributions of 95% commercial/residential and 5% industrial) utilizing three sampling locations. Although LWA indicate that both grab and composite samples were collected to estimate the AEMCs, as well as annual loadings, it is unclear how the different sample types were used. According to the EPA's Guidance Manual For The Preparation of Part 2 of the NPDES Permit Applications for Discharges From Municipal Separate Storm Sewer Systems (EPA 833-B-92-002), an event mean concentration (EMC) is determined from analyses of flow-weighted composite samples. In order to qualify as a valid sample, the storm event must be sampled for at least three hours, or for the entire storm if the event lasts less than three hours. Of great importance in such derivations is consistency in methodology, i.e., the first method employed must always be employed to ensure that results can be compared. LWA do not provide any information to confirm the consistency of sampling procedures.

* LWA completed a discharge characterization project (DCP) for storm water discharges in 1996 (not included as part of commenter's submission). LWA state that the DCP evaluated all urban runoff monitoring data available. However, it is not clear whether the data set used for the DCP was the same as that analyzed for the current report, or whether it was more extensive. LWA state that the DCP used "statistical modeling" (unnamed methodology) to "characterize and estimate" mass loadings. They also state that data on heavy metals, conventional and non-conventional pollutants were "updated for 1996/1997 data. However, they do not report which procedures governed the "update," whether the data sets were consistent, or under what circumstances they were sampled and analyzed. EPA believes that this lack of information makes it impossible to evaluate the methodologies used to extrapolate the data set and draw conclusions as to its appropriateness in demonstrating nonattainability of toxic criteria. In addition, LWA cite a "robust statistical method" for deciding whether to use detection limit values for nondetect data. This method is not described.

* It appears from Charts 1 through 5 presented in the report, that LWA use a limited data set (not included as part of commenter's submission) for each of the pollutants of concern, and use statistical projections to predict "worst case" (i.e., 95th, 99th, and 99.91th percentiles) discharge values. These predicted discharge concentrations are then used to assess whether instream criteria would be met. This is an extremely conservative approach that would not be used by EPA to establish compliance with water quality-based effluent limits or water quality criteria. To assess the potential for metals and organics to exceed aquatic life and human health criteria during intermittent, high flow, storm water episodes, a

complex dynamic modeling effort would be required. This procedure is highly data intensive, and is beyond the scope of this costing analysis; nevertheless, it should have been employed in the LWA analysis to accurately determine the potential for exceedances of criteria. The generalized technical approach for assessing compliance with the applicable criteria is described in EPA's Technical Support Document for Water Quality-Based Toxics Control (March 1991). For typical point sources, this is performed by developing wasteload allocations (using steady-state models, under low flow conditions) and developing WQBELs based on these wasteload allocations. The process of developing wasteload allocations and WQBELs that would be protective of applicable criteria during storm events is significantly more difficult, and is not described in current EPA guidance. The EPA Center for Exposure Assessment Modeling (CEAM), located at the National Exposure Research Laboratory in Athens, Georgia, maintains and distributes environmental simulation models and databases for urban and rural nonpoint sources. Information on dynamic models and their use for storm water modeling can be obtained through CEAM.

Cost Methodology Issues

* It is unclear why Tables 7 and 7a were included in the analysis. These tables appear to present costs associated with the implementation of the BMPs required by the current Sacramento MS4 permit. They are, therefore, distinct from any incremental attainment costs associated with treatment of storm water due to water quality criteria. The potential costs resulting from the alternative of collecting and treating all storm water prior to discharge are summarized in Figure C, however, no details, explanatory notes, or assumptions are presented in support of this estimate.

* Figure B states that capital costs range from $160 to $187 million. However, EPA notes that only the higher value is presented in the summary. The choice to use only the higher value is not explained. It appears that the difference in the values results from the assumed level of engineering and other costs (50% of capital costs, as opposed to 30%, see Table 7). Other published sources have traditionally used a percentage more consistent with the lower of the two values referenced in Table 7 (see, for example, Estimating Costs for the Economic Benefits of RCRA Noncompliance, U.S. EPA, March 1997, page 1-4, where the percentage increase due to engineering and inspection, contractor's overhead and profit, and contingency is 35%).

Other Methodological Issues

* LWA do not clearly state what proportion of the County's runoff enters the American River versus the Sacramento River. LWA base their presentation largely on discharges to the American River which has a two-fold lower hardness concentration, resulting in the most stringent metals criteria. As noted above, a hardness value of 25 mg/l (as CaCO3) is on the very low end of the range for receiving waters considered in the CTR analysis.

* LWA focus their presentation on the "no dilution" scenario. However, both the American and Sacramento Rivers provide substantial dilution (reducing runoff concentrations by 51% and 86%, respectively). The analysis developed in the LWA report summarizes the results of this evaluation in Tables 11 and 12. In presenting the data, the LWA evaluation incorrectly calculates the dilution provided by the Sacramento River. When correctly calculated, the analysis indicates that the acute criteria for all of the metals would be met at the 99.91 percentile value in the Sacramento River. In addition the acute criterion for lead would be met for the American Rivers. Furthermore, compliance with copper and zinc criteria would practically be achieved assuming dilution and implementation of BMPs (i.e., 70% reduction of copper and zinc by BMPs). In their assessment of instream mixing, the LWA analysis used ambient background pollutant concentrations presented in Tables 11 and 12. While

all other values are indicated as "dissolved" concentrations, no such note is provided for the background data. If these values are expressed as total metals it would overestimate the background load and thus underestimate the available assimilative capacity of the stream.

* Similarly, the LWA does not account for in-stream dilution in its evaluation of the potential for PAH compounds and pentachlorophenol to exceed human health criteria. In its evaluation, LWA again projects worst case (i.e., 95th, 99th, and 99.91th percentile) storm water concentration values and compares these values directly to ambient human health criteria. This approach significantly overestimates the potential for exceeding these criteria. Human health criteria are developed assuming a lifetime exposure to the pollutant at a daily ingestion rate of 2 liters of drinking water and ingestion of an assumed mass of aquatic organisms. To account for such long term exposures, EPA permitting procedures recommend using typical stream flows (e.g., harmonic mean) in developing wasteload allocations. The calculated wasteload allocations are also assumed to represent long-term averages (i.e., average monthly permit limits) rather than maximum daily values. Depending on the available dilution, this approach generally results in WQBELs much higher (i.e., less stringent) than the actual criterion values. Based on LWA projections, it appears that even a small allowance for dilution would resolve the compliance concerns or pentachlorophenol. The potential for compliance concerns identified by LWA for PAH compounds could only be accurately determined based on the results of the dynamic modeling assessment previously discussed.

* In calculating the allowable discharge concentration (Ce) for lead and zinc, LWA used detection level values for ambient background concentrations even though no lead or zinc were measured. Since background concentrations may actually be significantly lower than the detection level, this may result in an overly stringent Ce (and thus more costly to achieve).

Comments from the Fresno Metropolitan Flood Control District (Fresno) and the California Department of Transportation (Caltrans)

EPA also reviewed comments submitted by the Fresno Metropolitan Flood Control District (Fresno) and the California Department of Transportation (Caltrans) on the CTR provisions relating to storm water. In response, EPA has the following concerns and comments regarding various aspects of the submissions and their conclusions. Some of these issues are addressed in the above review of LWA's submission and are so referenced.

General Limitations of the Analysis

* Neither Fresno nor Caltrans provide the raw data upon which they base their conclusions regarding potential compliance problems with the proposed CTR water quality criteria. Without the raw data, EPA could not fully assess the validity of the analysis.

* Caltrans' data came from eight storm events at three urban freeway sites in the Los Angeles area, but the sampling methodology is not specified (i.e., first flush, peak, outfall, street, etc.). The data may not be representative of the storm water discharges for all Caltrans facilities. Fresno does not specify the sampling methodology nor the number of sites or storm events sampled.

* Fresno reports that applying BMPs (including end-of-pipe) to storm water would not result in attainment of criteria as proposed in the CTR. However, Fresno presents a stringent (and unlikely) scenario for attainability of criteria (i.e., applying chronic criteria).

* Caltrans reports that applying source reduction and nonstructural BMPs will not provide the reduction

necessary to meet the criteria. End-of-pipe treatment would be required. Although acute criteria are used in this analysis, no data or estimates are provided to demonstrate that BMPs would not result in reductions needed to comply with properly developed WQBELs.

* The analysis also may not be reflective of the compliance scenario for other California waters.

* Fresno and Caltrans compare the concentration of the dissolved fraction of metals in the discharge to the instream criterion values expressed as dissolved metals to assess compliance. See the response to LWA for EPA's discussion of the problems with this approach.

* Cost estimates provided in the Fresno and Caltrans analysis for complying with the CTR may mix BMP implementation costs to comply with local storm water permits with new compliance costs resulting from the CTR. EPA's economic analysis only evaluates the incremental impact of the water quality standards for toxics compared to the baseline program to avoid a double counting of costs (and benefits).

Specific Data and Sampling Issues

* Caltrans specifies that consistent procedures were used at all three sampling sites, but it does not specify the exact methodology (i.e., sampling duration, first flush, etc.). Of great importance in data analysis is consistency in methodology, i.e., the first method employed must always be employed to ensure that results can be compared.

Fresno does not describe its sampling procedures or methodology.

* Caltrans uses a limited data set (not included as part of commenter's submission) for each of the pollutants of concern, and uses statistical projections to predict "worst case" (i.e., 99.91th percentile) discharge values. These predicted discharge concentrations are then used to assess whether in stream criteria would be met. This is an extremely conservative approach that would not be used to establish compliance with water quality-based effluent limits or water quality criteria because compliance is based on measured values and not on statistically derived worst case values.

Summary and Recommendations

The LWA report was based on storm water data collected at outfalls discharging to the American and Sacramento Rivers. The report did not provide the raw data, nor did it provide detailed information on how these data were collected. The primary scenario described in the report (i.e., comparing projected worse case discharge concentrations directly to chronic aquatic life and human health criteria with no allowance for dilution) is highly conservative in comparison with the water quality-based permitting and compliance procedures that would be implemented by EPA. The LWA analysis also did not consider the equilibrium partitioning of dissolved and total metals that may occur instream during a storm event. An ancillary analysis summarized in the LWA report compared the maximum projected discharge concentrations (99.91 percentile values) of copper, lead, and zinc to the acute aquatic life criteria accounting for dilution. If errors are corrected in the LWA spreadsheet, the LWA data indicate that there would be no compliance problems for these parameters in the Sacramento River, and that BMPs would likely result in compliance in the American River. While the LWA analysis provides information that could be useful in determining "reasonable potential" for possible WQBEL development, the approach is not consistent with water quality-based permitting procedures or EPA's approach to compliance assessment.

To accurately determine whether additional treatment would be necessary to control storm water discharges to the American and Sacramento Rivers, EPA would conduct a comprehensive modeling effort to develop appropriate WQBELs. The WQBELs (for organics and total metals), would be developed using dynamic models to account for the intermittent loadings and exposures from the storm water discharges. EPA recognizes that the determination of appropriate WQBELs for storm water outfalls is a difficult modeling effort that requires intensive data collection and verification. The LWA report has not utilized this approach, and the necessary level of effort is not within the scope of the agency's CTR analysis.

In summary, the CTR language allows (consistent with EPA's policy) the practice of applying MEP to MS4 permits, along with BMPs as effluent limits to meet water quality standards where infeasible or insufficient information exists to develop WQBELs. Neither the LWA report, nor the Fresno and Caltrans comments, provide a definitive argument that storm water dischargers cannot achieve compliance with the proposed water quality criteria or that compliance would result in widespread economic impact or hardship. Although none of the three comment submissions discussed above provide the raw data used for their analyses for EPA to fully assess the validity of the analyses, their methodology does not assess compliance with WQBELs as would be developed by EPA. In particular, the assessments do not account for dilution or the partitioning of dissolved metals to suspended solids present in the receiving waters. LWA and Caltrans also do not apply the appropriate criteria in assessing compliance and use statistical projections to predict "worst case" discharge concentrations, an approach that would not be used to establish compliance with WQBELs or water quality criteria. In addition, LWA's estimated costs do not accurately portray the incremental expense to Sacramento County resulting from implementation of the CTR, that is, the costs attributable to the CTR criteria that are over and above the cost of implementing the current storm water program.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

1. Concern: The Rule, as presently proposed, appears to require discharges from municipal stormwater programs to meet water quality based effluent limits (WQBELs).

* In order to achieve WQBELS, it will be necessary to intercept all of the urban runoff from the Sacramento metropolitan area (including that discharged to urban streams and the American River),

transport it to an area near the Sacramento River for equalizing storage and subsequent end-of-pipe treatment, and then discharge it to the Sacramento River (See Attachment A), The capital cost of this structural control program is estimated to be on the order of $2.5 billion. Amortizing that cost over a 20-year period, at 7% interest and including annual operation and maintenance costs, the total annual cost to bring Sacramento urban stormwater into compliance with the proposed criteria is on the order of $260 million per year.

* Even this enormously expensive end-of-pipe treatment will not guarantee achievement of the proposed criteria (e.g., PAH removals of 99% may not be achievable with the proposed end-of-pipe treatment which formed the basis of the cost estimate).

Further, as indicated in the attainability analysis provided in Attachment A, this $260 million per year program may not result in any net environmental benefits. Extensive ambient river monitoring over the past five years has shown that copper, lead, and zinc levels in the American and Sacramento Rivers generally comply with the proposed criteria and are not significantly impacted by stormwater discharges (PAH data are not available). On the other hand, the removal of stormwater discharges from the urban streams would likely have a negative environmental impact. It would lead to destruction of the aquatic and riparian habitat which currently exists. Thus, this $260 million per year program would not lead to any of the types of benefits that formed the basis of EPA's benefits analysis, including fishing use benefits, reduced cancer benefits, or passive benefits. In this case, the cost is $260 million per year and there may be no net environmental benefits. Therefore, pursuant to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act, -EPA should consider alternative criteria for copper, lead, zinc and PAHs for those waters in the Sacramento area.

We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

* The cities of Folsom and Galt, co-permittees in our stormwater program, both have populations less than 50,000. Their costs associated with complying with the effluent limitations proposed in the Rule would be significant (on the order of $10 million annually for each city). Therefore, the EPA Administrator's certification that the Rule would have no effect on small entities, pursuant to the requirements of the Regulatory Flexibility Act, is incorrect.

Comment: RECOMMENDED MODIFICATIONS

To address our concerns, we recommend the following modifications which do not undermine the toxic pollutant control actions envisioned in EPA's economic analysis (e.g., BMPs for stormwater and source control). In fact, some of these recommendations would provide incentives for greater movement toward achieving the water quality criteria than would occur under the Rule as it is currently proposed.

I. Recommendation: Modify the Preamble statement that indicates municipal wet weather discharges must comply with water quality standards or WQBELs (Preamble pages 42186-42187).

* It is not a requirement of the CWA or EPA that wet weather discharges must meet water quality criteria. If it were, the adverse economic impact on municipal stormwater programs would be enormous. The CWA, at best, is ambiguous on this issue; EPA regulations do not address it; and the Elliott memorandum, which appears to be the primary basis for EPA's position on this issue, is not a legitimate basis for such a position. The Elliott memorandum is an internal EPA memorandum and; therefore, is not an independent interpretation of the CWA. The Elliott memorandum does not constitute EPA policy and is based upon a false premise and an inaccurate reading of the preamble to EPA's 1988 proposed stormwater regulations. The Elliot memorandum contains other erroneous conclusions that have never been applied to municipal stormwater permits (e.g., that municipal stormwater dischargers must comply with water quality standards within three years of permit issuance).

* EPA has routinely approved municipal stormwater NPDES permits that have not included requirements to comply with water quality standards (e.g., Tulsa, OK; Greesnboro, NC; Denver, CO; Portland, OR; Cedar/Green (Seattle), WA; Sarasota County, FL; and Phoenix, AZ).

* If EPA does not modify the Preamble statement to clarify that municipal stormwater dischargers are not required to comply with these water quality standards, then EPA must include the cost of the structural controls necessary for compliance in its economic analysis and, using these costs, address the requirements of Presidential Executive Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act.

Response to: CTR-040-014b

EPA believes the applicability of water quality standards to storm water discharges is outside the scope of the rule. See response to CTR-001-003. With respect to the comment about potential costs to municipal storm water dischargers see responses to CTR-040-004 and CTR-021-006a.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our storm water program:

3. In its analysis, the USEPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP Program (over and above what an MS4 has in place already). Studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control District shows this to be incorrect, i.e., a BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost for a BMP program is significant and would increase substantially if an MS4 was required to construct end-of-pipe treatment for compliance. The USEPA should not implement the proposed criteria to MS4 discharges until such time as an adequate economic analysis addressing the true impacts to MS4 dischargers is conducted and assessed.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our storm water program:

4. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly by the proposed rule. In California, there are many small communities that are currently co-permittee to MS4 permits. Many of the larger municipalities in California have conducted storm water discharge characterization studies. These studies have shown that there are common pollutants associated with storm-water discharges from urbanized areas that could result in compliance problems with the proposed criteria . Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule, it indicates that there are no small entities to be impacted by the rule, and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: Economic Analysis

The Sanitation Districts commends EPA for preparing an analysis of the economic impacts of the proposed CTR, and for selecting POTWs for half of the case studies. We believe that EPA is correct in thinking that POTWs are likely to experience major impacts as a result of the promulgation of the CTR. However, we believe that this analysis is based on improper assumptions and inaccurate cost estimates, resulting in unconvincing conclusions. Our own attainability and cost analysis indicates that there are indeed fundamental flaws in the cost analysis. A few of the areas of concern are listed below:

* The Economic Analysis ignores the costs that may be incurred by stormwater dischargers and nonpoint sources to reduce loadings so that CTR criteria may be met in ambient waters.

Comment: By far, the greatest deficiency with the CTR is the US EPA's failure to include a properly conducted economic analysis associated with the application of these criteria into standards governing the regulation of urban area and highway stormwater runoff-associated constituents. The application of these criteria to this situation will result in significant unnecessary expenditures for chemical constituent control in an effort to try to achieve the criteria values when implemented as standards for receiving waters for urban area and highway stormwater runoff.

Comment: Overall Comments The California Toxics Rule (CTR), as proposed, is significantly deficient in providing an economic analysis that includes information on the cost, and an assessment of the water quality benefits, of ultimately having to meet state water quality standards based on CTR proposed criteria in the receiving waters for urban area and highway stormwater runoff. Without this information, the public, regulatory agencies and the regulated community cannot understand the significant technical deficiencies that exist in the US EPA CTR proposed rulemaking. The CTR should not be finalized until this information has been developed and provided to the public for review and comment. Urban stormwater discharge representative-speaker after speaker at the September 17, 1997 hearing on the proposed CTR was justifiably concerned about the confusing situation that exists today; they are being informed by the US EPA that NPDES-permitted urban stormwater runoff will be subject to meeting water quality standards (objectives) in the receiving waters for the stormwater runoff during the time of runoff and after through a process of ever-increasingly stringent and expensive BMPS.

As I testified at the September 17, 1997 hearing, it is well-understood in the stormwater runoff water quality management field that the US EPA "Gold Book" water quality criteria, including those being promulgated under the California Toxics Rule, are not designed to address short-term, episodic discharges of chemical constituents of the type that routinely occur in stormwater runoff from urban areas and highways. As a result, "administrative" exceedances of the proposed California Toxics Rule criteria can readily occur without any real impairment of the designated beneficial uses of the receiving waters for the stormwater runoff. By real impairment of aquatic life-related beneficial uses I mean alteration of the number, types and/or characteristics of desirable forms of aquatic life in the receiving waters for the runoff, that are of concern to the public who must ultimately pay for the control of chemical constituents in the stormwater runoff.

There has been a sufficient number of studies conducted on the characteristics of urban and highway

stormwater runoff to document that it will indeed be rare that the constituents present in urban stormwater runoff from residential and commercial areas are in toxic, available forms for a sufficient duration and magnitude in the receiving waters for the runoff to be adverse to aquatic life. As long as the US EPA persists with its improperly developed and adopted Independent Applicability Policy (by which chemical criteria/standards have to be met even if appropriately conducted studies show that the constituents of concern, such as heavy metals in urban stormwater runoff, are in non-toxic, unavailable forms) urban stormwater runoff water quality managers face ultimately having to spend large amounts of public funds to avoid "administrative" exceedances of inappropriate criteria/standards for urban stormwater runoff, with no expected improvement in the real beneficial uses of the waterbodies that are of concern to the public who must ultimately pay for the control programs.

Problems with "administrative" exceedances arise from what are well-known to be technically invalid and inappropriate approaches adopted by the US EPA in the 1980s for implementing the "Gold Book" criteria, that the Agency under various administrations has yet to address. These issues are discussed in the attached papers and in references provided therein. Even today, based on discussions at the US EPA's Multi-Regional Water Quality Criteria and Standards meeting that was held at the end of August 1997 in St. Louis, Missouri, the Agency is still unwilling to address in a meaningful way the problems in regulating urban stormwater runoff water quality. For the Agency to announce, as it did at that meeting, that wet-weather water quality management issues are no longer part of the ANPRM for water quality standards, represents a serious deficiency in the Agency's current policy that must be corrected if the public is to be protected from wasting large amounts of funds constructing structural BMPs to work toward achieving CTR-based water quality standards in the receiving/discharge waters for urban stormwater runoff.

As was pointed out by several speakers at the CTR hearing held on September 17, 1997, the US EPA Region 9 and US EPA headquarters made a significant error in developing the California Toxics Rule where those responsible chose to ignore the massive costs that regulated urban stormwater dischargers will ultimately have to bear as part of implementing the California Toxics Rule. I believe that if this matter were taken to the courts, the urban dischargers could force US EPA Region 9/Washington, D.C. to do a proper economic analysis of the cost of ultimately having to achieve water quality standards (objectives) based on CTR criteria. The fact that there is some ill-defined period of time during which the standards/criteria can be met through BMPS does not change the ultimate cost that will have to be borne by the public. It is my assessment that these costs will be on the order of at least $1 to $2 per person per day forever for the regulated communities.

Several of the urban stormwater dischargers who testified at the September 17, 1997 hearing reported that their preliminary cost estimates were even greater than those that I projected since not only would they have to construct and operate large treatment works to capture, store and treat urban stormwater runoff so that no more than one exceedance of a criterion/standard occurs every three years, but also they would have to acquire land near waterbodies where such treatment works could be developed. Representatives of Alameda County estimated that more than 50 facilities each the size of the Oakland Coliseum would have to be constructed to store the stormwater runoff from a two-inch, one-day storm. The construction of such facilities in near shore areas of Alameda County on San Francisco Bay might be justified if there were reason to believe that they would solve real, significant water quality use-impairments of San Francisco Bay occurring due to urban stormwater runoff-derived constituents that exceed proposed CTR criteria for protection of aquatic life. However, the fact is that after extensive study, none of the heavy metals in Bay Area urban stormwater discharges has been found to be in toxic, available forms that are causing real water quality use-impairments. Basically, the expenditures of dollars per person per day for the regulated community-dwellers that are now dictated by the Clean Water Act and the US EPA's Independent Applicability Policy arise from the US EPA's failing to address

the obvious, significant problems with the application of the "Gold Book" and now proposed CTR criteria to urban stormwater runoff-associated constituents.

I have found that the urban stormwater runoff water quality managers are not claiming that there are no water quality problems associated with their stormwater discharges. It appears that there may be real water quality problems in urban stormwater discharges due to chemicals such as the organophosphate pesticides (e.g., diazinon and chlorpyrifos) for which the US EPA has either failed to develop a criterion (diazinon) or has failed to implement an existing criterion (chlorpyrifos). I understand that finally, after years of delay during which it has been well-known by the US EPA that diazinon was causing widespread aquatic life toxicity, the Agency is now beginning again to formulate a water quality criterion for this chemical. Additional summary information on the organophosphate pesticide issue is presented in the attached paper, "Diazinon and Chlorpyrifos as Urban Stormwater Runoff Associated Pollutants," June (1997)

It is important to understand that the development of criteria for chemicals such as diazinon does not mean that those criteria will be properly implemented or enforced. The chlorpyrifos situation is an example; chlorpyrifos has been well-known to cause aquatic life toxicity in many communities' stormwater runoff, yet the Agency, including US EPA Region 9, has failed to admit publicly that there is a problem, much less act to control the toxicity problem. Under the current regulatory approach, stormwater dischargers could be required under CTR to spend massive amounts of public funds building "50 Oakland Coliseums" just to store stormwater runoff in Alameda County from a storm magnitude that occurs more frequently than once in three years because of administrative Exceedances of several CTR-regulated heavy metals in the stormwater runoff (which have been repeatedly found to be in non-toxic, unavailable forms, including the dissolved forms), while the treated stormwater discharge to San Francisco Bay could be highly toxic due to unregulated or inadequately regulated organophosphate pesticides. This is an artifact of the inappropriate approaches used by the Agency of focusing on chemicals rather than chemical impacts, i.e., on potential toxicants rather than toxicity. While this approach is bureaucratically simple to administer, it is technically invalid and can lead to a massive waste of public funds in implementing stormwater runoff water quality management programs.

Urban stormwater runoff water quality management is in chaos. This situation has been well-understood for at least five years. While attempts are being made to address these issues through the US EPA headquarters' various wet-weather committees, thus far the fundamental issue that was raised at the September 17, 1997 hearing by urban stormwater discharger after discharger, i.e., ultimately having to achieve water quality standards based on CTR criteria in the receiving waters for the discharge through ever-increasingly stringent BMPS, has not been adequately addressed. While the proposed CTR does not specify a time period over which the BMP ratcheting-down process will occur, there can be no doubt that time period will be set by the courts through litigation brought by environmental groups who will assert that an NPDES-permitted stormwater discharger is not making adequate progress toward achieving the ultimate goal of only one violation of a water quality standard every three years for regulated constituents. Because of the uncertainty of how the courts will handle this matter, stormwater dischargers could be faced with having to achieve water quality standards in the discharge waters within five to ten years. Clearly there is need now to understand the costs and true water quality benefits associated with achieving these standards as part of adopting the CTR as it is applied to regulating urban stormwater runoff water quality.

I have published extensively on these issues. Many of my papers and reports on this topic are available from my web site (http://members.aol.com/gfredlee/gfl.htm).

It is my recommendation that US EPA Region 9 and US EPA headquarters postpone any adoption of

the California Toxics Rule until the US EPA properly presents and discusses the potential costs and the potential water quality benefits in terms of real improvements in designated beneficial uses of receiving waters that will likely accrue as the result of regulated urban stormwater discharges' ultimately having to comply with water quality standards based on CTR criteria. The US EPA Region 9 should allow the stormwater dischargers the opportunity to provide information on the costs and benefits arising from applying these criteria to stormwater discharges as required by the Clean Water Act when it becomes clear that BMPS of the type that are readily available today will not eliminate the administrative Exceedances of water quality standards numerically equal to the aquatic life criteria set forth in the CTR. After allowing the urban stormwater dischargers to provide this information, the US EPA then should develop an economic analysis that reliably presents and discusses these issues. This CTR review process is the necessary first step to correcting the significant chaos that now exists in the urban stormwater runoff water quality management field.

Comment: Page 42186, third column, last paragraph and page 42187, first column, first paragraph discuss the application to wet-weather loads. The proposed US EPA criteria will tend to significantly over-regulate wet-weather flows such as urban area and highway stormwater runoff. It is estimated that these costs are on the order of $1 to $2 per person per day. This issue is discussed in the attached papers and in other papers on my web site.

Comment: Comments on Economic Analysis of the Proposed Water Quality Toxics Rule

Page ES-2, second paragraph, "Scope of Economic Analysis," states, "In addition, EPA does not calculate costs for NPDES sources which are not typically subject to American WQBEL's including sources required to hold NPDES permits stormwater permit and other wet weather dischargers."

This is a significant deficiency in the cost analysis which makes the CTR largely unreliable. As long as NPDES stormwater dischargers are required to work toward the goal of achieving water quality standards in the receiving waters for stormwater runoff, the cost of achieving these standards must be included in evaluating the potential economic impacts of adopting these criteria. While most NPDES wastewater discharges meet or are close to meeting these criteria at the edge of a mixing zone for the discharge, NPDES-permitted stormwater dischargers in Phase I as well as the soon-to-be-released Phase 2 are not yet even beginning to effectively comply with the requirement of meeting water quality standards in the stormwater runoff during wet-weather runoff events. While it is unknown at this time what the situation will actually be in the future with respect to compliance with water quality standards for NPDES-regulated urban and highway stormwater runoff, until there is a clear, unequivocal policy adopted that exempts urban area and highway stormwater runoff from meeting these criteria, the costs of meeting such standards must be included in a proper evaluation of the cost of implementing these criteria.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our stormwater program:

3. The economic analysis used by the U.S. EPA is flawed and inadequately addresses the impacts of the CTR on the stormwater-regulated community. The U.S. EPA's economic analysis focused entirely on the compliance cost of point sources, which included Public Owned Treatment Works (POTWs), industrial treatment facilities, and industrial users discharging to POTWs. A major omission in the U.S. EPA analysis is the cost for the stormwater program to comply with the proposed criteria.

In its analysis, the U.S. EPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP program (over and above what an MS4 has in place already).

Studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control District shows this to be incorrect, i.e., a BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost for a BMP-program is significant and would increase substantially if an MS4 was required to construct end-of-pipe treatment for compliance. The U.S. EPA should not implement the proposed criteria to MS4 discharges until such time as an adequate economic analysis addressing the true impacts to MS4 dischargers in conducted and assessed.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our stormwater program:

4. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the

proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule, it indicated that there are no small entities to be impacted by the rule, and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our stormwater program;

3. The economic analysis used by The USEPA is flawed and inadequately addresses the impacts of the CTR on the stormwater-related community. The USEPA's economic analysis focused entirely on the compliance cost of point sources, which included Public Owned Treatment Works(POTWs), industrial treatment facilities, and industrial users discharging to POTWS. A major omission in the USEPA analysis is the cost for the stormwater program to comply with the proposed criteria.

In its analysis, the USEPA appears to assume that a BMP program will lead to compliance and that there is no associated cost for a BMP Program (over and above what an MS4 has in place already). Studies conducted by the County of Sacramento and Fresno Metropolitan Flood Control district shows this to be incorrect, i.e., a BMP program cannot comply with the proposed criteria. Furthermore, these studies show that the cost for a BMP program is significant and would increase substantially if an MS4 was required to construct end-of-pipe treatment for compliance. The USEPA should not implement the proposed criteria to MS4 discharges until such time as an adequate economic analysis addressing the true impacts to M84 dischargers is conducted and assessed.

Comment: The City of Los Angeles is hereby transmitting its comments regarding the proposed California Toxics Rule (CTR). I would like to begin by stating that the City currently spends an average of $28 million annually on its Stormwater Management Program. The majority of Program activities are guided by the Los Angeles County Municipal Stormwater Permit, which dictates the use of Best Management Practices to control pollutants to the maximum extent practicable. We are primarily concerned with how the CTR may impact the Stormwater Management Program.

* The City recommends that a parallel economic analysis be conducted to address the impacts of the CTR on the stormwater-regulated community.

Comment: As was pointed out by several speakers at the hearing yesterday, US EPA Region 9 and US EPA headquarters made a significant error in developing the California Toxics Rule where they chose to ignore the massive costs that regulated urban stormwater dischargers will ultimately have to bear as part of implementing the California Toxics Rule. From my perspective, and I do not speak for any discharger, I believe that if this matter were taken to the courts, the urban dischargers could force US EPA Region 9/Washington, D.C. to do a proper economic analysis of the cost of ultimately having to achieve water quality standards (objectives) based on CTR criteria. The fact that there is some ill-defined period of time during which the standards/criteria can be met through BMPs does not change the ultimate cost that will have to become by the public. It is my assessment that these costs will be on the order of at least $1 to $2 per person per day forever for the regulated communities.

Several of the urban stormwater dischargers who testified at yesterday's hearing reported that their preliminary cost estimates were even greater than those that I projected since not only would they have to construct and operate large treatment works to capture, store and treat urban stormwater runoff so that no more than one exceedance of a criterion/standard occurs every three years, but also they would have to acquire land near waterbodies where such treatment works could be developed. As you heard, Alameda County estimated that over 50 facilities the size of the Oakland Coliseum would have to be constructed to store the stormwater runoff from a two-inch, one-day storm. While the construction of such facilities in near shore areas of Alameda County on San Francisco Bay might be justified if there was reason to believe that they would solve real, significant water quality use impairments of San Francisco Bay that are occurring due to urban stormwater runoff-derived constituents that exceed proposed CTR criteria for protection of aquatic life, the facts are that after extensive study, none of the heavy metals in Bay Area urban stormwater discharges had been found to be in toxic, available form. Basically, the expenditures of dollars per -person per day for the regulated community dwellers that are now dictated by the Clean Water Act and the US EPA's Independent Applicability Policy arise from the US EPA failing to address the obvious, significant problems with the application of the "Gold Book" and now proposed CTR criteria to urban stormwater runoff-associated constituents.

Response to: CTRE-002-003

EPA did not include benefits or costs of controlling nonpoint sources or storm water dischargers in its estimates of benefits and costs of the CTR. EPA believes that the final rule will not have a direct effect on sources not permitted under the NPDES program (e.g., nonpoint sources) or NPDES sources not typically subject to numeric water quality-based effluent limits (e.g., wet weather discharges). Any potential indirect effect on nonpoint sources and wet weather discharges, such as runoff from farms, urban areas, and abandoned mines, and contaminated sediment, is unknown at this time. Many of the programs developed to control nonpoint sources and wet weather discharges are already in place. Costs

due to these programs have already been incurred or will soon be incurred owing to existing federal, State, and local environmental programs.

EPA also acknowledges that nonpoint sources and wet weather discharges are technically difficult to model and evaluate costs because they are intermittent and highly variable. Nonpoint source and wet weather discharges also occur under different hydrologic or climatic conditions than continuous discharges from industrial and municipal facilities, which are evaluated under critical low flow or drought conditions. Thus, evaluating agricultural nonpoint source discharges and storm water discharges and their effects on the environment is highly site-specific and data intensive.

CROSS REFERENCES I-1

Comment: MR. HALE: Good afternoon. My name is Robert Hale and I'm the chairman of the California Stormwater Quality Task Force which is located at 951 Turner Court, Suite 300, in Hayward.

This task force is a statewide organization representing municipal separate storm sewer systems that hold National Pollutant Discharge Elimination System, NPDES, permits to discharge stormwater.

My comments today are on behalf of the -- principally on behalf of that task force. I also am chairman of the management committee of the Alameda Countywide Clean Water Program. I will make some comments with respect to Alameda County.

As proposed by EPA, the preamble language, which is the principal point here in referring to numeric effluent limitations and water quality based effluent limitations, is clearly inconsistent with the plain language used by Congress in incorporating the maximum extent practicable standard into Section 402(p)(3)(B) of the Clean Water Act.

You may argue that this reference is only in the preamble and not in the main text of the rule; but it's my understanding, however, that the preamble itself is supposed to explain and clarify the meaning of the rule and the Clean Water Act. This proposed language would instead appear to be trying to change one of the fundamental points of the Clean Water Act.

The reason I think this point is fundamental is that the cost to society, and to our county in this case and to the states, is an important consideration. Congress considers the entirety of the tasks that the country has to do, rather than going for broke on one issue such as stormwater quality.

In short, the Congress balances the larger picture, and the language in Section 402(p)(3)(B) actually

reflects that balance. I believe that Section 402(p) says what it says for a good reason. The only economically feasible means of achieving water quality standards is through best management practices.

To illustrate this point, I work in Alameda County as chairman of the Clean Water Program there, and I did some rough calculations here. We often get storms as much as 2 inches in a 24-hour period. That's several times a winter. If you had a one-day storm, as I figure it, that will work out to 5 billion gallons of runoff water.

To treat this much water, if we were driven to this sort of the extreme case by the language in the preamble -- and I'm not talking about the text of the rule so much as the language in that preamble -- if it were to drive us in this extreme case to have -- to do end-of-pipe treatment for our discharges in order to meet the standards that are there, and to keep up -- basically keep up with the storms, which often come one behind the other within a couple days, it would necessitate building dozens, perhaps more, treatment plants of substantial size and would necessitate the use or acquisition of valuable industrial properties on the margins of the bay. Which I just did a little separate figuring here; I'm figuring it costs about $3 a gallon to treat -- to secondarily treat sanitary sewage and about $4 a gallon to store it.

I estimate that a storm of this size -- to be able to handle a storm of this size would cost between 35 and $50 billion for Alameda County alone. This is for a population of l.35 million residents.

And this does not account for the acquisition of property needed to do this, assuming we could store it in facilities or properties we already own. And it also does not account for the secondary treatment. In fact, we might have some difficulty achieving the standards that are in the rule.

And there's a way you can express this getting down to the nuts and bolts of it, which I like to do. I did some rough estimates of the size of the Oakland Coliseum, and if you were to use structures the size of the Oakland Coliseum for storing this water from one of these storms, I figured it would come out to -- you'd need 50 of them to store the runoff from this one storm that I've got here.

And I know some of you might be thinking about how the A's are doing right now and this might not be a bad idea. We can, say, think about leaving an extra one there for the A's and Raiders and build 50 more of them.

But the point is, we're talking about a tremendous investment in the infrastructure here, and it's very difficult for us to keep up with.

So let's see. Just a few more points here.

So we're not really talking about upgrades to existing delivery and treatment systems. We would have to start from scratch and build pumping systems, conveyance systems, to build an entire infrastructure. The cost would be prohibitive for us in Alameda County. This is a -- sort of one of the worst-case scenarios. And I think that the economic rule -- or the economic analysis in the rule doesn't do this justice.

So --

MR. MORRIS: Have you done any modelling?

MR. HALE: This is strictly back-of-the-envelope type calculations at this point. I don't know whether or not -- what discharges the storm concentrations would result in.

The first question I have on modeling is to see what these discharges of stormwater with these effluent concentrations -- under the storm conditions if we would be -- would have a higher flow than the drought flow condition which was modeled.

When you have a storm event, the stream conditions are different, the hydrology is different, the modeling characteristics. We could work out the scenario. And it's true that when you've got a huge storm, water fires right out the bay and out the Golden Gate. We might even probably need to talk about that and work on that.

Response to: CTRH-001-001b

EPA disagrees with the comments. See response to CTR-001-003. For a discussion of EPA's evaluation of studies concerning costs associated with achieving water quality criteria for storm water discharges, see responses to Comments CTR-013-003 and CTR-040-004. For a discussion of the scientific validity of CTR criteria, See response to CTR-031-004c.

EPA disagrees with the cost estimates provided by the commenter as EPA does not believe that storage and treatment of stormwater would be required to ensure compliance with the CTR. See response to CTR-021-006b.

Comment: We're going to submit more responses in written comments having to do with other issues such as wet weather. I would really encourage you to listen carefully to those who have experience in building wet weather facilities.

We know it costs $4 a gallon for storage. We know the latest cost of building treatment facilities is about $3 a gallon, so those are real numbers. And so I think you do need to pay attention to the wet weather issue as well.

Comment: Second, we are concerned that the compliance cost for the stormwater programs to meet the objectives of the proposed rule will be significant. Already the city spends about $1.2 million to implement a program that services 400,000 people.

Unfortunately, even with the proactive stormwater programs implemented in the State of California, BMP programs will probably fall short of the water quality standard for several of the constituents included in the rule. And in cases where objectives are achieved, it will take several years.

As my counterpart and co-permittee from Sacramento County, Kathy Russick will describe, the City of Sacramento has estimated cost for compliance based on five of the constituents in the CTR: copper -- dissolved copper, dissolved lead and dissolved zinc, pentachlorophenol and PAHs.

These costs -- this study indicates that the costs will be very extreme to even come close to meeting those objectives and the objectives -- and this is from six years of monitoring data and six years of a proactive BMP program, so we are basing this on fact. And again, Kathy will elaborate on this in her discussion.

And also the analysis -- economic analysis focuses only on POTW discharges, not industrial discharges. Again, with the costs we're seeing for stormwater compliance, we feel that the analysis falls short and that EPA should revisit the economic analysis and include not only the cost for municipal stormwater programs to comply, but also the cost for the industrial stormwater programs.

Response to: CTRH-001-033

The commenter claims that BMP programs will fall short of the water quality standards for several pollutants included in the CTR. EPA disagrees with the commenter and believes that BMP programs, when properly implemented, will be sufficient to ensure compliance with CTR-based standards.

See also the response to CTR-021-006b, CTR-001-007, and the preamble to the final rule.

Comment: In closing, in terms of some of the comments made by especially the municipal stormwater

programs, first, I'd like to just make a comment that economic analysis might be required by executive order, but it isn't required by the Clean Water Act; that standards, in fact, cannot include any kind of economic consideration in terms of coming up with a scientifically based number.

The Act mandates a scientifically based number. State level doesn't do that, but the federal level is quite clear. And you have no authority to include in your numbers an economic criteria. So I'll just remind you of that, to -- just to balance off the comments today with -- not exactly balance. At least one person said that.

And also in terms of the storm -- fears of the stormwater programs, they're quite fearful of the language in here. I would simply remind folks, 402(p) under the permits section doesn't rewrite 303D, formulate the TMDLs and load allocation requirements. It doesn't rewrite the need for permits to go beyond best available technology or whatever they need to do to meet the criteria- it doesn't rewrite 301.

So 402(p) takes a back seat effectively to a situation where you had a violation of standards in the ambient water. Those permits would by definition be subject to a particular regional board's discretion to revise them as proposed.

I don't think any realistic look at the future indicates that all the permits will be rewritten with numerical effluent limits, given the magnitude of that program. I would just put in my word of reason that there's really nothing to be afraid of. The South Bay has a stormwater program, and in Santa Clara County we have a stormwater program that looks like every other municipal stormwater program in the area.

And I think that's about it.

Response to: CTRH-001-054

EPA agrees with the commenter that criteria must be science-based and are established so as to ensure the protection of designated uses of California waters. EPA performed an Economic Analysis of the implementation of the rule to determine the potential economic impact of the CTR, not to establish standards or criteria. Also see response to CTR-042-007a.

Comment: Does the California Toxics Rule meet the legal requirements of the Clean Water Act and other federal policies and laws?

Previous municipal stormwater speakers have questioned, as we have, EPA's interpretation of Section 402(p) of the Clean Water Act. In addition, the California Toxics Rule raises significant questions regarding its conformance with other federal policies and laws including Executive Order 12866, the Unfunded Mandates Reform Act, the Regulatory Flexibility Act, and the authority for EPA to adopt blanket criteria without considering the designated uses of such waters as required under the Clean Water Act.

To give you just one example, I'd like to briefly compare the California Toxics Rule with the compliance of Executive Order 12866:

Under Executive Order 12866, any "significant" federal regulatory action must be referred to the Office of Management and Budget for review before it can be approved. In this context, a "significant" action includes one which will "have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy." Though admitting that there "may be a cost to some dischargers" to comply with the water quality standards that will be derived from these toxics criteria, the EPA nonetheless argues that the proposed rule is not a significant action because it "establishes ambient water quality criteria which, by themselves, do not directly impose economic impacts."

First, nothing in Executive Order 12866 indicates that only actions with direct economic impacts are to be considered by OMB. Second, for the EPA to ignore the link between the toxics criteria in the proposed rule and the obligations being imposed is very questionable. Is EPA conceding that State and regional water boards may simply ignore these criteria when promulgating water quality standards and issuing permits? Nothing in the preamble indicates that EPA views these criteria as merely advisory.

Despite stating that Executive order 12866 is not applicable, EPA goes on to include an economic analysis which purports to demonstrate that the proposed rule will result in a net economic benefit. The problem with this analysis is that it completely ignores the enormous cost that municipalities will bear if they are forced to bring their stormwater discharges into compliance with these toxics criteria. For example, a 1990 study conducted for the Sacramento Stormwater Program estimated that it would cost nearly $2 billion to implement a treatment program to achieve the water quality criteria proposed in the former Inland Surface Water Plan. Costs to comply with the proposed toxics criteria would be similar, if

not higher, than those proposed in the Inland Surface Water Plan. Ultimately, the costs of compliance may reach into the ten of billions of dollars.

In short, EPA cannot have it both ways. It cannot state that stormwater discharges are subject to the proposed toxics rule and then turn a blind eye toward the costs associated with the implementation of this rule. The costs of the proposed rules are direct and significant, and therefore the rule must be submitted to OMB for review.

We have comparable concerns with the other federal laws that I cited previously, and we will elaborate on them in our written comments.

Response to: CTRH-002-006b

See response to CTRH-002-006a.

EPA established criteria in order to comply with the requirements of the Clean Water Act. In order for such criteria to achieve their intended purpose, the implementation scheme must be such that the final results protect aquatic life and human health. EPA disagrees that designated uses are not considered. It is through the implementation of the CTR that site-specific factors of water bodies and discharging facilities (e.g., hardness, pH, stream flows, or site-specific criteria studies) are considered and designated uses are protected.

EPA disagrees with the commenter that municipalities will bear "enormous" costs to bring their stormwater discharges into compliance with the CTR criteria, however, EPA was not able to evaluate the commenter's compliance cost estimate of "tens of billions of dollars" because the commenter did not provide a methodology or any data for EPA to evaluate. Also see response to CTR-021-006b, CTR-021-005c, and the preamble to the final rule.

Comment: We recommend that EPA conduct an economic analysis to assess the full impacts of the wet weather discharge requirements of the proposed rule and further evaluate the actual benefits of implementation of the rule.

The County of Orange encourages EPA to work cooperatively with California municipal stormwater stakeholders to resolve these issues. Through the California Stormwater Quality Task Force, the municipal stormwater dischargers have demonstrated our ability to work cooperatively with the EPA and State Water Resources Control Board to develop mutually effective solutions to facilitate implementation of the stormwater program. Such intergovernmental coordination is needed to develop a feasible

program to protect the environment.

Comment: MR. SHEYDAYI: Good afternoon. I'm Alex Sheydayi of the Ventura County Flood Control District, and I'm here to speak on behalf of the Ventura County Management Program.

Before I make my comments, I would also like to express my -- our program's support for the comments that were made by Mr. Crompton earlier and also by our speakers in San Francisco that spoke on behalf of the Municipal Water Quality Management Programs statewide.

Our program -- The permit for our program was issued in August of '94. And our program basically consists of 12 permittees in the flood control district which is the municipality and the municipal permittee which is the County of Ventura and ten cities in the county.

At the time that we applied for the stormwater permit, only three municipalities in the county were required to do so. The others entered the program voluntarily in order to maintain a uniform program countywide. Currently, of the 12 corporate permittees, five corporate permittees would not even be required to have permits under Phase 20 because they have populations far west than that required for Phase 20. So you can see we have very small communities that are participating in the program voluntarily.

The commission earlier stated that one of the reasons many of the corporate permittees entered the program voluntarily is to maintain a uniform program countywide. And one of the incentives for doing that was the fact that the program was a BMP-driven program to comply with the requirements of a permit to the maximum extent practicable under the Clean Water Act.

We have also recently completed a four-year monitoring program and, using the information from the monitoring program, we have attainability of the data that we have collected for our program. This attainability data indicates that even if we comply -- apply the BMP program to the maximum extent possible, the expenditure of radial funds, we would still not be able to meet the requirements of the proposed criteria for several of the metals and other constituents, which would then -- of course, our program would go into a treatment mode for stormwater discharges. We believe that this was going to be very costly for us, particularly very costly for smaller communities who don't have the base to spread the cost of such an expense over their population.

Our programs, like so many other municipal programs in California, were based on implementation of programs to address source of weakness, not to provide the treatment. Just to give you an idea of why we concur with the other speakers concerning the economic analysis and the fallacy of the economic analysis, let me just give you a very quick example of the cost that we are currently incurring. We are currently spending $5 per -- for every man, woman, and child in Ventura County to implement a BMP-based program. And yet if you'll look at the pages that were presented in the CTR of the maximum $87 million statewide, the number will be approximately two and a half to three dollars for every person in California to implement the CTR — not just the stormwater dischargers, but for all dischargers statewide. So we think that there is something wrong with this whole analysis if we are currently exceeding the cost of the assumptions made in the analysis for compliance with CTR.

We also, as I said earlier, believe that the analysis should take into consideration the size of the communities, and as Mr. Crompton mentioned earlier, most of the municipal programs in California are very small communities and the cost of applying the treatment would be very, very difficult for them to comply with.

That's the end of my comment. I thank you for the opportunity to speak.

MR. MORRIS: Are you going to submit the data and the analyses that you did that show why -- You said you have a lot of data. Are they going to --

MR. SHEYDAYI: We are not going to submit them on the comments. We are going to be submitting that data -- It's still relatively in raw form, but we will be submitting that data to the regional board with our annual report in November.

MR. MORRIS: If you could get me or send me a copy or Diane a copy of the data and how you calculated your WQBEL, your permit limit based on the new criteria, that would be useful. I'd like to see how you did that.

MR. SHEYDAYI: Okay. We'll send you whatever we can put together.

MR. MORRIS: I think there is a misconception that people have to implement the criteria for stormwater dischargers at the drought low condition and the 7QlO condition. That's not the case. When we issue a permit, you keep that limit for a stormwater discharge, you usually model the condition that occurs in. If you do it right, that gives you a model that gives you concentration in the receiving water and the duration of the exposure of that concentration, and then you'll compare that to the criterion and flood flow or rain flow or storm flow. Right? Usually you have enough to keep your WQBEL below the criteria and you don't see the effects. If you do a good model, you shouldn't have any impact.

If you look across the country, across the U.S., there are many, many states that have standards on the books, water quality standards that are far more stringent than the numbers we're promulgating or proposing to promulgate in Southern California. If you look at their standards, you won't see any black boxes on the end of those stormwater discharges. Nobody builds treatment for stormwater treatment in this country. They've been implementing standards for 15 years. California is no different.

Response to: CTRH-002-017

The costs attributable to the CTR are only those incremental costs which will be incurred to go from compliance with existing permits to compliance with more stringent CTR-based limits. EPA's revised

cost estimates from the Economic Analysis range from $33.5 million to $61.0 million annually. The commenter compares BMP costs of $5 per person to potential CTR compliance costs, however, this is not relevant because CTR costs are incremental costs and are not based on the costs of existing programs. See also responses to CTR-021-006b and CTR-035-048.

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Lost Angeles County Stormwater Program:

2. The application of water quality standards to MS4 stormwater discharges would result in end-of-pipe treatment to reasonably achieve compliance and provide limited environmental benefit. Putting aside the issue of whether water quality standards apply to MS4s, the CTR as presently proposed will require stormwater agencies to incur significant costs with minimal improvement in water quality. Based on studies conducted by the County of Sacramento and the Fresno Metropolitan Flood Control District, stormwater discharges being controlled through an aggressive BMP-based program could not be certain of achieving the proposed water quality criteria. To achieve the criteria, end-of-pipe treatment would be necessary. It is reasonable to assume that other municipalities throughout California where special studies have not been conducted will not be able to meet the proposed criteria as well, thus requiring public agencies throughout California to collect and treat its stormwater discharges. This is unreasonable and is not consistent with the intent of the CWA for the following reasons:

The preamble to the Federal stormwater regulations(*2) clearly indicates that it was not the intent of Congress to require municipal permits to require end-of-pipe treatment technology but to implement a comprehensive stormwater management program to reduce the discharge of pollutants from municipal storm sewer systems.

If municipal stormwater discharges are required to comply with the proposed rule, end-of-pipe treatment or zero discharge would be the only alternatives to achieve compliance. This would result in major capital expense to construct the collection and treatment facilities. In addition, this may result in other more significant environmental impacts, such as destruction of wetlands and wildlife habitats.

We recommend that the proposed rule not apply to MS4 discharges. However, if the USEPA should continue to impose the proposed rule to MS4s, the rule should be revised to specifically address compliance issues and resolution to those issues for MS4 discharges that adequately reflect the intent of Congress when it implemented the municipal stormwater program.

Comment: 2. The application of water quality standards to MS4 stormwater discharges would result in end-of-pipe treatment to possibly achieve compliance which would only provide limited environmental benefit. Putting aside the issue of whether water quality standards apply to MS4s, the CTR as presently proposed will require stormwater agencies to incur significant costs with minimal improvement in water quality. Based on studies conducted by the County of Sacramento and the Fresno Metropolitan Flood Control District, stormwater discharges being controlled through an aggressive BMP based program could not be certain of achieving the proposed water quality criteria. To achieve the criteria, end-of pipe treatment would be necessary. Even then, certain criteria, e.g. PAHs, cannot be attained through typical treatment BMPs. In the case of Sacramento, a capital cost of $2.5 billion was required to provide treatment. The annual cost, including operation and maintenance, for such an arrangement was $444 million. It is reasonable to assume that other municipalities throughout California where special studies have not been conducted will not be able to meet the proposed criteria as well, requiring public agencies throughout California to collect and treat all stormwater discharges. This is unreasonable, and not consistent with intent of the CWA for the following reasons:

* The preamble to the Federal stormwater regulations (*1) clearly indicates that it was not the intent of Congress to require municipal permits to require end-of-pipe treatment technology, but to implement a comprehensive stormwater management program to reduce the discharge of pollutants from municipal storm sewer systems.

If municipal stormwater discharges are required to comply with the proposed rule, end-of-pipe treatment or zero discharge would be the only alternatives to achieve compliance. Extrapolating the Sacramento cost for end-of-pipe treatment to a population of $22 million (*2) results in an annual cost of $7 billion. In addition to the significant compliance costs, there are other issues that could make such alternatives infeasible.

- Fully developed communities may not have the vacant land available to construct collection and treatment facilities. Acquisition of developed land would be very expensive.

- Going to zero discharge or constructing and operating collection and treatment facilities may result in other more significant environmental impacts, such as destruction of wetlands and wildlife habitats.

- Technologies to treat not only the quantity of stormwater but to reduce toxic pollutants to low concentrations are not currently available.

* As noted in the economic analysis to the proposed rule, EPA estimates that only 3% of the total load of toxic pollutants to fresh waters of the State are from point source discharges, which include municipal stormwater discharges. Since point source discharges contribute a small percentage of the total toxic pollutant load, reducing the toxic pollutants in stormwater would result in only marginal water quality improvements in the waters the proposed criteria are intended to protect. The costs to implement a BMP based program alone to address toxic pollutants, without considering end-of-pipe treatment, are significant and not justified when compared to the marginal water quality benefits to be achieved.

Recommendation: The proposed rule should not apply to MS4 discharges. However, if USEPA should continue to impose the proposed rule to MS4s, the rule should be revised to specifically address an resolve these compliance issues, as they apply to MS4 discharges, in a manner consistent with the intent of Congress when it adopted the requirements of the municipal stormwater program.

Comment: Additionally, CBIA and CBPA are concerned with the findings in the "Economic Analysis of the Proposed California Water Quality Toxics Rule." The acknowledgment by EPA in the economic analysis that "the water quality criteria in this rule may also have an indirect effect on sources not permitted under the NPDES program or not subject to numeric water quality-based effluent limits is extremely troublesome. Sources not permitted under the NPDES program include nonpoint sources and wet weather discharges such as runoff from farms and urban areas. The economic analysis continues by stating that "any potential effect on these sources is unknown at this time" and that "the State may ask or require these sources to implement best management practices or participate in a comprehensive watershed management approach. Since the economic analysis only focuses on the costs to point source dischargers and not non-point discharges, CBIA and CBPA believe that the potential economic impact of the proposed rule is greater than identified in the economic analysis.

We thank you for your consideration of these comments.

Response to: CTR-069-002a

EPA did not include benefits or costs of controlling nonpoint sources or storm water dischargers in its estimates of benefits and costs of the CTR. EPA believes that the final rule will not have a direct effect on sources not permitted under the NPDES program (e.g., nonpoint sources) or NPDES sources not typically subject to numeric water quality-based effluent limits (e.g., wet weather discharges). Any potential indirect effect on nonpoint sources and wet weather discharges, such as runoff from farms, urban areas, and abandoned mines, and contaminated sediment, is unknown at this time. Many of the programs developed to control nonpoint sources and wet weather discharges are already in place. Costs due to these programs have already been incurred or will soon be incurred owing to existing federal, State, and local environmental programs.

EPA also acknowledges that nonpoint sources and wet weather discharges are technically difficult to model and evaluate costs because they are intermittent and highly variable. Nonpoint source and wet weather discharges also occur under different hydrologic or climatic conditions than continuous discharges from industrial and municipal facilities, which are evaluated under critical low flow or drought conditions. Thus, evaluating agricultural nonpoint source discharges and storm water discharges and their effects on the environment is highly site-specific and data intensive. Until this information is available, it is premature to project that the sources would incur any costs beyond those for which they

are already responsible under the current regulations of the Clean Water Act.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our stormwater program:

2.The application of water quality standards to MS4 stormwater discharges would result in end-of-pipe treatment to reasonably achieve compliance and provide limited environmental benefit. Putting aside the issue of whether water quality standards apply to MS4s, the CTR as presently proposed will require stormwater agencies to incur significant cost with minimal improvement in water quality. Based on studies conducted by the County of Sacramento and the Fresno Metropolitan Flood Control District, stormwater discharges being controlled through an aggressive BMP-based program could not be certain of achieving the proposed water quality criteria. To achieve the criteria, end-of-pipe treatment would be necessary. It is reasonable to assume that other municipalities throughout California where special studies have not been conducted will not be able to meet the proposed criteria as well, requiring public agencies throughout California to collect and treat its stormwater discharges. This is unreasonable and is not consistent with the intent of the CWA.

Comment: Finally, even if the Elliot Memo were not incorrect (and, given the plain language of the statute, it clearly is), EPA's position that WQBELs may be applied in municipal stormwater permits requires that it conduct an economic analysis of the proposed rule's potential impact on municipal stormwater dischargers. In this regard, it makes no difference whether WQBELs are expressed as numeric effluent limitations or in the form of BMPS. For if BMPs must be calculated on the basis of the numeric criteria contained in the proposed CTR rather than on section 402(p)(3)(B)(iii)'s maximum extent practicable standard, they are likely to have significant economic consequences -- consequences the Agency has failed to even attempt to analyze in its proposal.

Members of the SCVURPPP look forward to EPA revising its proposal to address the comments contained in this letter and those offered by their fellow municipal stormwater dischargers.

Please contact me at the telephone number listed above if you have any questions concerning the matters covered by this letter or wish to discuss them further.

Response to: CTR-087-003

EPA did not include benefits or costs of controlling nonpoint sources or storm water dischargers in its estimates of benefits and costs of the CTR. EPA believes that the final rule will not have a direct effect on sources not permitted under the NPDES program (e.g., nonpoint sources) or NPDES sources not typically subject to numeric water quality-based effluent limits (e.g., wet weather discharges). Any potential indirect effect on nonpoint sources and wet weather discharges, such as runoff from farms, urban areas, and abandoned mines, and contaminated sediment, is unknown at this time. Many of the programs developed to control nonpoint sources and wet weather discharges are already in place. Costs due to these programs have already been incurred or will soon be incurred owing to existing federal, State, and local environmental programs.

EPA also acknowledges that nonpoint sources and wet weather discharges are technically difficult to model and evaluate costs because they are intermittent and highly variable. Nonpoint source and wet weather discharges also occur under different hydrologic or climatic conditions than continuous discharges from industrial and municipal facilities, which are evaluated under critical low flow or

drought conditions. Thus, evaluating agricultural nonpoint source discharges and storm water discharges and their effects on the environment is highly site-specific and data intensive.

Comment: EPA'S PROPOSAL VIOLATES THE REGULATORY FLEXIBILITY ACT

Several of the member agencies of the ACCWP have populations less than 50,000 (Piedmont, Emeryville, Albany) and will be significantly affected by the proposed rule if it results in the adoption of NELs or WLAs in the permit for their discharges. These "small entities" under the Regulatory Flexibility Act ("RFA") are entitled to both initial and final regulatory flexibility analyses under the RFA.

EPA's finding that a substantial number of small entities will not be significantly affected by the proposed rule is arbitrary and capricious given this demonstrated impact. A substantial number of municipalities less than 50,000 in population are currently covered by NPDES permits for their storm water discharges. In addition, EPA's upcoming Phase II storm water regulations may substantially expand the universe of small municipalities that will be subject to NPDES permits and, through those permits, to the provisions of the CTR.

Neither the ACCWP, the ACCWP's member agencies or, to our knowledge, any other storm water system that will be subject to this rule, was contacted by EPA in advance of the proposed rulemaking and given a reasonable opportunity to participate in the rulemaking as required by 5 U.S.C. section 609(a). In addition, as a "covered agency" under 5 U.S.C. section 609, EPA must process the proposed rule in accordance with the provisions of that section, including the convening of a review panel, but apparently has failed to do so.

Comment: If you go beyond best management practices, you're impliedly eliminating those provisions of the 1995 Basin Plan. I think it would clearly violate the Regulatory Flexibility Act, since you haven't considered the costs of controls.

If, again, our dischargers had to do whatever it took, our members had to do whatever it took -- and in fact, several of our dischargers are small entities under the Regulatory Flexibility Act: the City of Emeryville, the City of Albany, the City of Piedmont.

The NPDES permits small entities and municipalities under 50,000 in number. If they had to do whatever it took to provide the waste allocations without consideration of the economic impact, those entities, because of the practical problems of needing 50 coliseums of storage in the Bay Area and the practical considerations that plague us -- and the only place you could put that is by the bay, where you have a serious problem with requirements under the Endangered Species Act.

To the extent you're standing in the shoes of the state in promulgating these standards, you violate the cost/benefit balances provision of the Porter Cologne Act.

Comment: Looking at the results of our monitoring and your criteria, we'll have to achieve another 70 to 90 percent reduction in pollutants in order to be in compliance. That means we'd have to increase our storage volume to 20,000 acre feet just to handle average annual runoff we have underway right now.

That's a price tag of $220 million to $400 million to try to stay in compliance with the current criteria if you interpret the rule to apply to us -- 220 million. And then we can't prevent major storm events in our community, storm impacts that cause a discharge, in which case 100 percent of the discharges would exceed -- would be out of compliance, even though we were retaining 100 percent of the average annual rainfall.

We think that raises a problem with the Regulatory Flexibility Act, both in terms of the cost analysis itself and the impact that accrues to small communities, certainly with respect to the executive order. Just in our case alone the $100 million limit is in serious trouble, dealing with compliance with a five-year schedule just in our community with the possibility of $80 million per year of expense. That does not include O & M cost in that system.

Response to: CTRH-001-008b

EPA disagrees with the commenter's cost estimates, because EPA does not believe that additional storage capacity will need to be constructed to comply with the CTR. However, no details of the cost estimate were provided, thus, EPA could not evaluate the estimated cost. See also response to CTR-001-008b, CTR-040-004, and CTR-050-007a.

Comment: Is the economic analysis appropriate?

Most of the municipal stormwater permittees in Orange County are communities of less than 100,000 in population. I might add that most of the permittees in California are small communities.

Based on our monitoring data and studies conducted by others, it is reasonable to assume that stormwater discharges from these small communities would be faced with the same compliance issues as the large and medium municipalities. EPA failed to address this potential impact in its economic analysis of the proposed rule.

Comment: C. If the CTR as proposed in the current draft is applied to municipal storm water dischargers as numeric effluent limitations, new end-of -pipe facilities will result. The impact of these facilities on the environment in general, and endangered species in particular, must therefore be specifically reviewed pursuant to the National Environmental Policy Act and Endangered Species Act.

End-of-pipe facilities would be required for municipal storm water dischargers in their attempt to meet the subject criteria. Storm water facilities must be located in the lowest topographic areas, which contain many of our most valuable and already diminished wetland habitats. This readily foreseeable environmental consequence of the CTR, if directly applied to municipal storm water dischargers, should not be ignored.

Response to: CTR-031-007b

With respect to ESA, EPA has completed consultation as required by Section 7 of the ESA. With respect to compliance with NEPA, section 511(c) of the Clean Water Act excludes this rulemaking from the requirements of NEPA. The comment also assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in the response to Storm Water Economics Comments (Category J, Comment CTR-040-004), EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

Comment: 2. If municipal storm water dischargers are required to meet water quality standards, this will result in the need for installation of expensive end-of-pipe treatment.

As explained in Attachment A included with these comments, Caltrans storm water discharges will, in many instances, be unable to comply with the proposed CTR numeric water quality criteria. In fact, as shown in Attachment A, falling rainwater (which acts as a mechanism for atmospheric deposition) cannot comply with the CTR criteria. As graphically illustrated in Figures 11 and 12 of Attachment A, the concentration of pollutants in the falling rainwater is a substantial fraction of the concentration of those pollutants found in storm water runoff. This demonstrates that atmospheric deposition may be a large source of pollutants in storm water.

The conclusion contained in Attachment A further states that if Caltrans is required to comply with the water quality standards proposed in the CTR, it will be forced to install costly end-of-pipe treatment.

Application of the necessary treatment technologies statewide for all of Caltrans facilities and rights-of-way equates to an astronomical cost. These costs were not even considered in EPA's Economic Analysis for the CTR.

Requests:

* Caltrans requests that EPA clarify the language of the CTR Preamble to state that municipal storm water dischargers must only implement BMPs to reduce the discharge of pollutants to the MEP.

* If the Preamble is not adjusted as requested above, EPA must adjust the costs contained in its Economic Analysis to reflect the potential cost to Caltrans and other municipal storm water dischargers that may be required to meet water quality standards by implementing BMPs and/or advanced treatment technologies.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our storm water program:

2. The application of water quality standards to MS4 storm water discharges would result in end-of-pipe treatment to reasonably achieve compliance and provide limited environmental benefit. Putting aside the issue of whether water quality standards apply to MS4s, the CTR as presently proposed will require storm water agencies to incur significant cost with minimal improvement in water quality. Based on

studies conducted by the County of Sacramento and the Fresno Metropolitan Flood Control District, storm water discharges being controlled through an aggressive BMP-based program could not be certain of achieving the proposed water quality criteria. To achieve the criteria, end-of-pipe treatment would be necessary. It is reasonable to assume that other municipalities throughout California where special studies have not been conducted will not be able to meet the proposed criteria as well, requiring public agencies throughout California to collect and treat its storm-water discharges. This is unreasonable and is not consistent with the intent of the CWA.

Comment: The City of Los Angeles is hereby transmitting its comments regarding the proposed California Toxics Rule (CTR). I would like to begin by stating that the City currently spends an average of $28 million annually on its Stormwater Management Program. The majority of Program activities are guided by the Los Angeles County Municipal Stormwater Permit, which dictates the use of Best Management Practices to control pollutants to the maximum extent practicable. We are primarily concerned with how the CTR may impact the Stormwater Management Program.

* The City is concerned that the application of water quality standards to municipal separate storm sewers, may result in end-of-pipe treatment. There are issues regarding the feasibility and environmental benefits of such treatment.

Comment: As Dave Brent of the City of Sacramento mentioned already, we have evaluated the numeric limits proposed in the rule against six years of our stormwater programs' monitoring data. We have identified five constituents that will be a problem -- where we will likely have a problem in meeting the numeric discharge limits: copper, zinc, lead, PAHs and pentachlorophenol. These also show up as problem constituents for other stormwater programs in the state as well.

We evaluated the reductions that we could attain through intense BMP and source control efforts and determined that, if implemented, we still could not reduce the concentration of these constituents enough to meet the numeric limits. And this leads us inevitably to end-of-pipe treatment.

I would like to illustrate for you the obstacles that a stormwater program faces in meeting numeric limits. This past year the Sacramento Stormwater Program conducted an intense effort to evaluate specifically lead, a high-priority stormwater constituent of concern for us as well as EPA.

A major part of our effort was to identify all potential sources of lead to stormwater in Sacramento County. We identified about 50 individual sources of lead. So the next step in our effort was to determine which of these sources of lead we could actually control considering the nature of the sources, the practicality of controlling the sources, and the legal jurisdiction of our respective agencies, et cetera.

Only a portion of the sources that we identified we could address through source control and BMPs within our program. An example of some of those sources that we have no or very limited control over are: soil erosion, the natural soil erosion that just happens, not to do with construction; aircraft fuel emissions -- by the way, aircraft fuel does not come in unleaded form; automobile emissions, which still contain some lead; abrasion of road striping paint; and the abrasion of tires. These are to name a few.

Our program is now in the process of incorporating practical control measures that we did identify for lead into the various implementation elements of our program, particularly our Industrial Management Program, though we realize that we can only get at a portion of the lead sources in our stormwater.

I would like to note that we are initiating a similar source identification/source control effort for copper this year and anticipate similar results as we experienced for lead, that we will be able to address only a portion of the sources of copper in our stormwaters.

We, the Sacramento Stormwater Program, are not just throwing up our hands and giving up on controlling the problem constituents in our area. We are pursuing control measures and implementing BMPs to address those sources that we can address. And we are committed to continuing this effort.

We are implementing ever-escalating BMPs. We are striving toward maximum extent practicable in accordance with the Clean Water Act. But we have limited control over the pollution of our stormwater.

Now, after looking at lead sources in Sacramento, we are again back to end-of-pipe treatment. We're pushed to end-of-pipe treatment.

The price tag that has been estimated for end-of-pipe treatment for Sacramento County is $2 billion. That, amortized over 20 years, is $200 million per year. End-of-pipe treatment for municipal stormwater programs was never the intent of the Clean Water Act.

Plus, what would be achieved overall if we did end-of-pipe treatment in Sacramento County? The County makes up only a fraction of the Sacramento River watershed, and while we would spend $2 billion on end-of-pipe treatment, the majority of the stormwater occurring within the entire watershed would go unchecked.

In conclusion, I emphasize that the target of municipal programs should be maintained as the maximum extent practicable. If this is indeed the intent of the California Toxics Rule, then clarify that in the rule.

I would like to thank you for the opportunity to speak on behalf of Sacramento County today.

Response to: CTRH-001-042

EPA disagrees with the commenter's cost estimate of $2 billion because EPA does not believe that end-of-pipe treatment will be required to comply with the CTR. However, no details of the cost estimate were provided, thus, EPA could not evaluate the estimated cost. See also response to CTR-040-004.

Comment: Secondarily and thirdly -- these two are tied together, the whole -- all our members that comply and have to secure the stormwater permits, we have been looking at how much it would cost us to build facilities to do some kind of end-of-pipe treatment to actually meet some of these numeric criteria for stormwater.

We don't think the economic evaluation that EPA has done is valid. Basically, there are a lot of shortcomings to it, and you have already heard today some of the numbers. The actual amount of money needed to build new facilities is way beyond the $86 million estimate that you have indicated in your analysis.

And based on this very serious economic evaluation shortcoming, I am recommending that at least a 30-day time limit be provided so that you can hear from the permit applicants regarding the statement to show you what the costs really are, and we'd like some more time to do that.

Those are essentially the substance of my comments today. Thank you.

Comment: Are the criteria attainable?

Orange County has developed and implemented a municipal stormwater quality management plan (also known as the Drainage Area Management Plan) which is applicable countywide. The Drainage Area Management Plan identifies a number of BMPs that address the major source categories of urban stormwater pollutants. These BMPs have been reviewed and approved by the respective regional water quality control boards. However, we have conducted a preliminary attainability analysis and have determined that, after considerable cost to fully implement a BMP-based program, it may not achieve compliance with proposed criteria for dissolved metals without regional or national product substitutions.

Although substantial public resources have been committed to implementation of this program, the municipal stormwater discharges in Orange County seem unlikely to attain all of the proposed criteria within the required compliance period. The alternative would be to collect and treat stormwater discharges as described in the Task Force testimony yesterday.

In addition to the capital cost, construction of these facilities would result in the displacement of jobs and housing as well as a loss of habitat. We believe that Congress intended municipal stormwater permits to implement programs to address sources of pollutants, not to provide end-of-pipe treatment to meet the numerical criteria.

Comment: EPA erroneously assumes that municipal stormwater dischargers can comply with the water quality criteria with BMPs and that BMPs do not cost money. Both assumptions are incorrect as evidenced by attainability analyses performed by several municipal stormwater dischargers.

Response to: CTR-054-020

EPA did not include benefits or costs of controlling nonpoint sources or storm water dischargers in its estimates of benefits and costs of the CTR. EPA believes that the final rule will not have a direct effect on sources not permitted under the NPDES program (e.g., nonpoint sources) or NPDES sources not typically subject to numeric water quality-based effluent limits (e.g., wet weather discharges). Any potential indirect effect on nonpoint sources and wet weather discharges, such as runoff from farms, urban areas, and abandoned mines, and contaminated sediment, is unknown at this time. Many of the programs developed to control nonpoint sources and wet weather discharges are already in place. Costs due to these programs have already been incurred or will soon be incurred owing to existing federal, State, and local environmental programs.

EPA also acknowledges that nonpoint sources and wet weather discharges are technically difficult to model and evaluate costs because they are intermittent and highly variable. Nonpoint source and wet weather discharges also occur under different hydrologic or climatic conditions than continuous discharges from industrial and municipal facilities, which are evaluated under critical low flow or drought conditions. Thus, evaluating agricultural nonpoint source discharges and storm water discharges and their effects on the environment is highly site-specific and data intensive.

Comment: Thank you for the opportunity to comment on the proposed California Toxics Rule. The City's comments are related to five main concepts:

3. The cost implications of these numerical standards are estimated to exceed $100 million to the City of Modesto alone, thereby triggering the President's Executive Order 12866 requiring a more detailed and comprehensive cost-benefit assessment of these proposed standards.

Specifically, the City submits the following comments:

E. Under the proposed rule, Best Management Practices (BMPS) are recommended for compliance with the California Toxic Rule. BMPs may include a variety of processes. Each of these processes may have an associated construction and operation cost. For the City of Modesto, due to the design of the wastewater and stormwater collection systems, it may cost between $25 million to $50 million to construct acceptable BMPS. Existing BMPs may not reduce the pollutant level below that listed in the proposed CRT. Therefore, it is our opinion that construction costs presented in the California Toxic Rule are significantly under estimated. Constructed treatment facilities for wastewater and storm water, beyond BMPS, could exceed $1 00 million for Modesto alone. In addition, annual operation and maintenance costs for BMPs and treatment facilities exceed $1,000,000.

In summary, the proposed regulation is significant because it may well impose costs that are greater than $100 million per year on the regulated community, the majority of which are local public agencies. Regardless of the dollar amount, it is likely to adversely affect, in a material way, the economy, the environment, and local governments.

Thank you in advance for consideration of my comments on the CTR.

Response to: CTR-096-003b

With respect to wet-weather compliance with the CTR see response to CTR-040-004. With respect to EPA's compliance with E.O. 12866 see CTRH-002-006a (Category I; Stormwater/Wet Weather Discharges).

Comment: THE PROPOSAL VIOLATES THE NATIONAL ENVIRONMENTAL POLICY ACT AND ENDANGERED SPECIES ACT, AND WOULD USURP THE ROLE OF CONGRESS AND THE STATE AND REGIONAL BOARDS

Major environmental impacts of controls could also be foreseen if the water quality standards of the proposed CTR were to apply as numeric effluent limitations or wasteload allocations. This would result in the requirement to prepare an EIS in connection with the proposed rule. (*13) In effect, substantial end-of-pipe treatment facilities on the same order of magnitude as existing POTWs in the Bay Area could be necessary.

Given the scale and location of the facilities that would be required, significant wetland, endangered species and other environmental impacts could occur. EPA must fully evaluate these impacts of the proposed rule before the rule is promulgated. (*14)

A more expansive application of the WQS also would usurp the basin planning process to the extent that the regional boards have included textual discussions of how ambient water quality criteria are to be implemented, particularly with respect to MS4s. The San Francisco Basin Plan states generally that WQS are to be addressed by MS4s through escalating BMPs. EPA has not taken action to disapprove the San Francisco Basin Plan and cannot implicitly repeal portions of that plan through inconsistent preamble language in the currently proposed rule.

Congress has already addressed this significant public policy question and the agency cannot shed its Congressional leash and arrogate legislative power. This is particularly true given the massive expenditures of public funds that could be implicated under at least the more expansive view of what EPA has proposed. We elect our representatives in Congress to balance these major questions, such as the matter of whether local funds should be siphoned from schools, police, infrastructure, etc., to fund storm water controls at the scale necessary to meet WQS regardless of cost. Congress has determined in Section 402(p) that MS4s need only adopt controls to reduce pollutants in storm water to the maximum extent practicable, and to effectively prohibit non-storm water discharges to the storm water system, rather than being subjected to infeasible or exorbitantly expensive numeric effluent limitations.(*15)

(*13) To the extent that the CTR will force development of end of-pipe treatment systems, promulgation of the CTR will represent a major federal action significantly affecting the quality of the human environment under the National Environmental Policy Act, triggering the requirement to develop an environmental impact statement to support the rule.

(*14) Commenters have been limited in their ability to present specific information on the question of endangered species, wetland and other environmental impacts given the short comment period on the proposal and EPA's refusal to extend that comment period.

(*15) In Sections 402(p)(5) and (6)f Congress also directed that the approach to meeting water quality standards should MEP-level controls on major dischargers fall short would be to study and expand the scope of the program to include additional dischargers. No mention is made of subjecting major MS4s to more stringent controls. In fact, the regulations are expressly required to target stormwater discharges, other than those discharges described in paragraph (2) [major MS4s], to be regulated to protect water quality - 33 U.S.C. section 1342(p)(6) (Emphasis added).

Response to: CTR-001-009b

With respect to compliance with NEPA, section 511(c) of the Clean Water Act excludes this rulemaking from the requirements of NEPA. The comment also assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in the response to Storm Water Economics Comments (Category J, Comment CTR-040-004), EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

The purpose of the CTR is to fill the current gaps in water quality criteria in inland surface waters and enclosed bays and estuaries. Any existing provisions in a State Basin Plan that have been approved by the State and EPA would not be negated by the preamble discussion in the CTR.

Regarding the application of MEP under section 402(p) of the CWA see response to CTR-040-004.

Comment: Lastly, it's been fairly well documented by EPA testimony before the Congress and by other state stakeholders' concerns about the end-of-pipe mandate, because the end-of-pipe facilities that must be constructed in effect create substantial damage to the riparian and other waters of the U.S. that are of primary concern to us.

With that potential, then certainly NEPA and the Endangered Species Act would require an evaluation of the impact associated with a rule causing or leading to those impacts. And again, the current rule does not consider that nor any of the cost or other impacts related to stormwater programs.

So there is a huge consistency or inconsistency problem that we think must be corrected for the rule to be consistent with the statutes and with your executive orders.

Thank you.

Comment: Sunnyvale has long been an advocate of watershed planning at the local level, and it is an enthusiastic charter participant in the Watershed Planning Initiative for the South Bay (the "WPI"). We believe that the WPI has significant potential to set the pace for "place-based" watershed management planning throughout the San Francisco Bay area, if not in California. The CTR-based criteria, particularly those for metals, will form the starting point for the water modeling which will lead to a TMDL and a wasteload allocation/load allocation for the South Bay. Accordingly, we have devoted significant time and resources to the joint efforts of our sister cities in the South Bay to work with EPA, the Regional Water Quality Control Board, affected industry, and the environmental community to make the WPI work. We believe that the WPI will be a credit to EPA's leadership and willingness to devote the considerable resources required.

In conclusion, we are entirely supportive of many of EPA's innovative approaches towards development of the CTR, particularly as regards the toxic metals. However, we believe that EPA has needlessly failed to comply with many of its legal obligations, particularly as regards the development of human health-based criteria on cancer risk levels of organic pollutants. We urge the Agency to reconsider its position in the matters covered by this letter (as amplified by the EOA Letter) and the CASA/Tri-TAC letter. Sunnyvale pledges its continued participation in place-based watershed management planning in the South Bay, its cooperation with the Agency in making a success of the WPI, and to an ongoing effort by the Agency and others to reach water quality goals in the South Bay. We thank you for the opportunity to comment on the proposed CTR.

Response to: CTR-021-003

EPA appreciates the commenter's support and significant participation in the Watershed Planning Initiative for the South Bay.

Comment: Regulatory Flexibility and Relief

The District supports EPA's use of "sound science" and current data in developing the proposed criteria in the California Toxics Rule (CTR). The District strongly supports language in the Preamble that references and endorses recommendations of the State Task Forces including use in permitting of:

* reasonable potential analyses * dissolved metals criteria * translators * water effects ratios * site specific objectives * innovative TMDL processes such as effluent trading * performance based interim limits * chronic and acute mixing zones, and * compliance schedules in NPDES permits.

Response to: CTR-032-002f

EPA appreciates the commenter's support of the preamble language concerning the State's use of innovative TMDL processes such as effluent trading.

Comment: Watershed Management Based Permitting Approach

Since POTWs are only responsible for contributing 1-10% of the toxics mass loading (including copper and mercury) to San Francisco Bay (CTR P. 7-7 EA) it makes economic sense to focus limited public resources on identification of larger and potentially more cost-effective sources to control. The District strongly believes that future permits should be developed using a comprehensive watershed management based approach, consistent with various EPA guidance including the August 1997 Robert Perciasepe TMDL Policy memorandum and the San Francisco Bay Regional Board's July 1997 Watershed Management Initiative Guidance.

The District supports the watershed approach where before additional control measures are imposed on point source dischargers, other potential sources of copper and mercury in the watershed that impact the receiving water need to be identified, quantified, and evaluated as to the potential cost of control

measures. Effluent trading should be permitted and encouraged where it is demonstrated to be a more cost effective pollutant reduction technique than additional point source treatment. We support the use of interim limits with compliance schedules linked to completion of special studies, in situations such as ours where compliance with final mercury and copper limits is not feasible and additional information is required to develop technically defensible and attainable final limits.

Response to: CTR-032-007

EPA appreciates District's support of the watershed management approach and its use in developing permits. However, EPA does not agree that the watershed approach should be applied in such a manner that would preclude additional point source controls until the impact of other sources of pollutants are "... identified, quantified, and evaluated as to the potential cost of control measures." We believe that TMDL development can be an effective tool to conduct such an evaluation and that TMDLs will be a component of many effective watershed management strategies.

EPA agrees with the District that pollutant trading can be a cost effective means of attaining compliance with water quality standards. EPA believes that TMDLs can provide the necessary analytical framework to implement a trading program. EPA will continue to encourage the State to evaluate such programs and will work with the State to ensure that such programs are designed equitably and do not result in the creation of "hot" spots in the watershed (See Draft Framework for Watershed-Based Trading, U.S. EPA 1996).

Comment: * As noted in our testimony at the September 18 public hearing, SCAP recommends that EPA describe in the Preamble the Agency's strategy for using a watershed management approach for controlling toxic pollutant inputs to the environment. This is particularly appropriate for pollutants which come primarily from nontraditional sources, are in the ambient environment primarily as a result of historical discharges (e.g. DDT, PCBs), and/or are difficult or very costly to control using end-of-pipe treatment. We believe that it is also appropriate to adopt a watershed approach for pollutants which are known to cause environmental harm - due to bioaccumulation, or other characteristics - but which are below detection levels.

Response to: CTR-034-011

EPA acknowledges the comment suggesting that it describe in the preamble the watershed management approach for controlling toxic pollutants into the environment. We believe that a detailed discussion of the watershed management approach is more appropriate in documents dedicated to the topic. Several documents already exist including EPA's Draft Framework for Watershed-Based Trading, dated May

1996, and EPA's Guidance for Water Quality-based Decisions: the TMDL Approach, dated April 1991. The preamble to the CTR contains information specific to the promulgation of the CTR. EPA appreciates the commenter's request for information and hopes that the documents listed above are informative.

Comment: Third, with respect to the criteria proposed for adoption in the draft CTR and implementation issues discussed in the preamble to the CTR, we wish to make the following recommendations to EPA.

- Consistent with EPA's Watershed Approach Framework and NPDES Watershed Strategy, EPA should describe in the Preamble the Agency's strategy for implementing a watershed management approach to achieve the CTR criteria in California, particularly since, as EPA's Economic Analysis for the CTR found, many -- if not most of the criteria will not be achieved solely with point source controls (U.S. EPA, 1996a and 1994a).

Response to: CTR-035-003

EPA acknowledges the comment suggesting that it include and describe in the preamble its strategy for implementing a watershed approach to achieve water quality standards based on CTR criteria. Please see response to CTR-034-011. The watershed approach is a flexible approach which may vary widely between water bodies in different situations. Since the State will create and implement a watershed management approach, EPA cannot prescribe an approach or strategy for the State to achieve water quality standards based on CTR criteria for all California water bodies. Various EPA publications exist for states and dischargers to use in developing strategies best suited for particular water quality situations for specific water bodies. These publications include those the commenter noted. EPA supports the State's use of a watershed management approach to implement CTR-based water quality standards for particular water bodies and pollutants.

Comment: We are concerned that the proposed rule reflects a reversal to the comrnand-and-control approach of water quality regulation and marks a policy shift away from the community-driven 'watershed' approach that EPA has been promoting. Orange County has a number of fledgling 'watershed' programs that we feel offer potential to effectively prioritize the approaches to be taken on a watershed-specific basis.

Response to: CTR-036-011

EPA disagrees with the comment that the CTR reflects a reversal to the command and control approach and marks a policy shift away from the watershed approach. The CTR merely sets into place water quality criteria for the State of California. These criteria, combined with the State-adopted beneficial uses, create water quality standards which are necessary to set bench marks for the State's water quality control programs, strategies, and approaches. The methods used to achieve the standards will continue to be through NPDES permits and other State programs, including programs which may utilize the watershed management approach. EPA continues to encourage and support the State's use of the watershed management approach to achieve water quality standards in various water quality control programs, and for appropriate situations.

Comment: Watershed Management

The Sanitation Districts recommend that EPA describe in the Preamble the Agency's strategy for using a watershed management approach for controlling toxic pollutant inputs to the environment. This is particularly appropriate for pollutants which come primarily from nontraditional sources, are in the ambient environment primarily as a result of historical discharges (e.g. DDT, PCBs), and/or are difficult or very costly to control using end-of-pipe treatment. We also believe that a watershed approach is the appropriate way to address pollutants which are known to cause environmental harm -- due to bioaccumulation, or other characteristics -- but which are below detection levels. We particularly encourage EPA to use a flexible watershed-based approach in implementing the CTR in the types of situations described above, where a point source-oriented command-and-control strategy is not likely to be effective.

Response to: CTR-059-014

In response to the comment that EPA should describe in its preamble the watershed management approach to achieve CTR-based water quality standards, please see response to CTR-035-003.

Comment: * In addition, EPA cannot make an accurate determination of the costs and benefits of promulgating CTR criteria for those criteria that are below achievable detection limits. Because detection limits for some pollutants will most likely improve in the near future, dischargers who are reporting regulatory compliance with current detection limits may not be in compliance when lower detection limits are achievable. OVSD (and likely other dischargers as well) have historically been required to report pollutant results with little regard to the detection limit achieved by the contract laboratory conducting the testing. This may have led to EPA's grossly under estimating the cost impact of the CTR. Detection limits of many priority pollutants identified in the CTR are actually lower than those achieved during recent special testing of OVSD's effluent to identify low pollutant levels. Therefore, the potential compliance costs to our commercial and residential dischargers could be significant, yet the Economic Analysis for the draft CTR could not estimate such costs. As a more reasonable alternative, OVSD recommends that a watershed approach be used to address these pollutants. OVSD's receiving water (the Ventura River) is currently managed using the watershed approach.

Response to: CTR-067-004b

In response to the comment that EPA should use a watershed approach to address CTR-based water quality standards, please see response to CTR-035-003.

Comment: * The District supports EPA Headquarters' Watershed Approach Framework and NPDES Watershed Strategy. We believe the CTR should address the EPA Region IX strategy for implementing

this management approach for pollutants with attainability issues. This is particularly crucial when regulating bioaccumulative pollutants, such as mercury. Region IX's commitment to this approach will insure appropriate consideration is given to watershed management strategies by State agencies when implementing the CTR.

Response to: CTR-083-002

EPA acknowledges the commenter's support for the watershed management approach. However, in response to the comment that EPA address the watershed management approach in the CTR for pollutants with attainability problems, please see response to CTR-035-003. EPA continues to support the State's use of the watershed management approach where appropriate.

Comment: Available Regulatory Relief under the California Toxics Rule

The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at. pg. 4 (emphasis added). Based on this assumption, no treatment cost was estimated for the facility. (*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself does riot mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Total Maximum Daily Loads (TMDLS)

The majority of the discussion of TMDLs contained in the Preamble to the CTR is merely a reiteration of the requirements of the Clean Water Act (CWA) and the existing regulations. See CTR at pg. 42185-6; see accord 33 U.S.C. Section 1313(d)(1)(C) and 40 C.F.R. Section 130.7. However, the Preamble discussion also contains recommendations regarding the implementation of TMDLs that merit some review.

First, EPA recommends that, since the TMDL process can be significantly labor and data intensive, collaborative efforts to establish TMDLs on water quality limited water bodies should be pursued. EPA envisions that this collaborative effort by dischargers, the State, EPA, and other stakeholders, could distribute work and associated costs between the interested parties, as well as shorten the overall time necessary to complete the analyses. See CTR at pg. 42185-6. This language attempts to alter the current statutory and regulatory language requiring that States must perform TMDLS, which are then submitted for EPA approval. If EPA is now proposing to allow other entities or coalitions to be able to establish TMDLS, this authority must be placed in the language of the rule itself, if not in an amendment to the CWA.

Second, EPA recommends innovative alternatives to traditional "pounds per day" TMDLS. The regulations and EPA guidance reviewed regarding TMDLs did not mention whether TMDLs had to be established as "pounds per day," The regulations define of "load" as "an -amount of matter, . . that is introduced into a receiving water" (40 C.F.R. Section 130.2(c)) and discuss TMDLs in terms of either mass per time, toxicity, or other appropriate measure" (40 C.F.R. Section 130.2(I)). These definitions seem to be flexible enough to allow for EPA's recommended alternatives to "traditional pounds per day TMDLS."

A third recommendation pertained to effluent or pollutant trading. In the Preamble to the CTR, EPA encourages innovative approaches such as effluent trading as a method to attain and/or maintain water quality standards. The Preamble at page 42185 describes effluent trading as follows:

Effluent trading allows sources that can control pollutants beyond compliance with current requirements to sell or trade credits for its excess reduction to in other source unable to control its own pollutants is effectively or as efficiently. The goal of an effluent trading program is to achieve similar or improved environmental results in a more cost-effective manner than under current regulatory structures. EPA's most current policy on effluent trading is summarized in the "Policy Statement for Effluent Trading in Watersheds" which was issued in January of 1996 and which reiterates President Clinton's commitment to effluent trading as expressed in the March 16, 1995 report on "Reinventing Environmental Regulation." The Policy states that the "EPA will work cooperatively with key stakeholders to find sensible, innovative ways to meet water quality standards quicker and at less cost than traditional approaches alone." The policy outlines several different types of trades that may take place. These trades include but are not limited to the following; (1) Intra-plant trading between outfalls within one facility; (2) pretreatment trading between indirect industrial point sources that discharge to a POTW; (3) point to point source trading, point to nonpoint source trading, and nonpoint to nonpoint source trading.

The existing regulations and EPA guidance relating to TMDLs already contemplate some form of pollutant trading.(*3) However, the regulations currently do not specifically allow the degree of trading outlined in the Preamble. To clarify that this is now EPA policy, EPA should propose language to that effect within the regulatory language itself.

The final recommendation EPA makes related to TMDLs addresses the use of interim permit limits when a TMDL/WLA/LA or other special study is underway but not completed. The Preamble gives guidance on how interim limits should be calculated. EPA states that "past performance and future uncertainty can be considered as factors in determining interim permit limits; however, permitting authorities may consider other factors, particularly factors concerning the water quality of the receiving water body and the overall goal to attain the water quality standard." EPA further states that it supports innovative ideas such as using specific method for determining interim limits and "trigger" concentrations above which corrective action would be necessary. Furthermore, EPA notes that the State, as the permitting authority, has broad discretion in determining how interim permit limits should be ascertained in different situations. CTR Preamble at pg. 42184-5. This language is helpful, but it should be placed into the rule so that it has the force of law and may be utilized as such.

As a Final note regarding the use of TMDLs as a form of regulatory relief, it should be noted that theuse of less restrictive effluent limitations based on TMDLs and interim limits is limited by the TMDL process itself as well as the antibacksliding provisions of the CWA. EPA guidance recognized these facts in its TMDL guidance with the following statement:

In developing a TMDL it is important to keep in mind certain constraints on the WLA [wasteload allocation] portion that are imposed by antibacksliding regulatory provisions. The WLA will normally

result in new or more stringent water quality-based limits than those contained in a previously issued permit. In a limited number of cases, however, it is conceivable that less stringent water quality-based limits could result. In these cases, permit limits must conform to the antibacksliding provisions contained in section 402(o) of the CWA. (*4)

(*1) This cost trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario, See EA at pg. 4.

(*2) In addition, pollutant load reductions word not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*3) See 40 C.F.R. Section 130.2(I) ("If Best Management Practices (BMPS) or other nonpoint source pollution controls make more stringent load allocations practicable, then wasteload allocations can be made less stringent. Thus, the TMDL process provides for nonpoint source control tradeoffs."); see also EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 it pg. 51 (April 1991).

(*4) EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 20 (April 1991) (Emphasis added)

Response to: CTR-004-006

EPA does not agree that a collaborative approach to TMDL development described in the preamble to the proposed CTR requires a change in statutory or regulatory language. Currently, the State's process for TMDL approval includes amendment of the affected Regional Board's Basin Plan, which requires approval by the State Water Resources Control Board and the Office of Administrative Law, prior to submital to EPA. The collaborative approach which EPA supports does not allow any other entity beside the State to establish TMDLs. The basis for the TMDL (e.g. the technical work) can be performed by other entities. That technical work can then be submitted by the State to EPA as part of the supporting documentation of the State-established TMDL.

EPA agrees with the commentor that current Federal regulations provide for flexibility in the manner that TMDLs are expressed. The commentor asserts that regulations do not specifically allow the degree of trading outlined in the preamble to the proposed rule. The current regulations do not prohibit the trading described in the preamble. TMDLs can provide the necessary analytical framework to ensure that trades are equitable and do not result in the creation of "hot spots".

With respect to TMDLs as a form of regulatory relief, the commentor asserts that EPA guidance indicates that little relief can occur for the waste load allocation portion of the TMDL due to anti-backsliding provisions of section 402(o) of the Clean Water Act. EPA believes that section 303(d)(4) of the Clean Water Act specifically allows for less restrictive effluent limits as long as such limits are consistent with an approved TMDL. However, these issues concerning TMDLs are outside the scope of this rule, and the rules concerning TMDLs may change.

In response to the commentor's discussion concerning the different regulatory relief approaches that EPA discusses in its Economic Analysis, please see response to CTR-032-004.

Comment: Sunnyvale is very supportive of many fine concepts advanced in the proposed CTR, and we join with CASA/Tri-TAC in complimenting the Agency on its proposed positions with regard to such matters as: (a) the use of interim effluent limitations in NPDES permits during the pendency of TMDL and other special studies; (b) the allowance of water effects ratios in adjusting the criteria for metals without the necessity for additional rulemaking to establish site-specific objectives; (c) the use of the dissolved state for the metals criteria; (d) the use of cooperative, intergovernmental, and stakeholder-involved approaches towards the development of TMDLs;(e) the allowance of dilution for both chronic and acute pollutants; and (f) the allowance of compliance schedules in NPDES permits.

Response to: CTR-021-002d

EPA appreciates the commenter's support of EPA's preamble discussion concerning the State's use of cooperative approaches toward the development of TMDLs.

Comment: * SCAP supports EPA's discussion in the Preamble regarding the use of interim permit limits while Total Maximum Daily Loads.(TMDLs) and other special studies are being performed. We strongly urge EPA to support the use of the SWRCB Permitting Task Force's recommended approach for deriving interim permit limits.

Response to: CTR-034-012b

EPA appreciates the commenter's support of the discussion in the preamble concerning the State's use of interim permit limits while TMDLs or other special studies are being developed. EPA supports the State's consideration of the stakeholder Task Force recommendations to help deal with these issues.

Comment: Second, we commend EPA for its inclusion in the CTR of several innovative and flexible regulatory approaches, such as metals criteria expressed as dissolved rather than total recoverable concentrations, and the revised human health criterion for mercury. In addition, in light of the issues surrounding the human health criteria for arsenic we support EPA's decision not to promulgate human health criteria at this time. With respect to implementation issues discussed in the Preamble, we support EPA's policies and guidance regarding the application of mixing zones and dilution credits. the use of interim permit limits while Total Maximum Daily Loads (TMDLs) and other special studies are being performed, and EPA's guidance to Regional Water Quality Control Boards (RWQCBs) that they may use any of the methods described in EPA's guidance document on the use of translators. We also support EPA's proposal to create a rebuttable presumption for Water Effects Ratios (WERs), allowing the RWQCBs and SWRCB to develop site-specific WERs that can be approved by EPA during the NPDES permit approval process. We believe that this approach will help facilitate the development of appropriate site-specific adjustments for metals criteria.

Response to: CTR-035-002g

Comment: C. Implementation Issues pp. 42184-42185 -- Total Maximum Daily Loads (TMDLs) We agree with EPA's statements in the Preamble in support of the recommendations of the Permitting and Compliance Issues Task Force regarding the benefits of collaborative approaches to developing TMDLs. We also endorse the State's and EPA's policy to allow innovative alternatives to traditional "pounds per day" TMDLs, and suggest that EPA expand this reference in the Preamble to include the concept of "quantifiable targets," under which TMDLs could be expressed as a mass loading, a concentration, a

percent reduction, an ecosystem improvement, or a degree of implementation of a control measure (such as a best management practice) (see SWRCB, 1995, Part VI).

EPA also encourages the use of innovative approaches such as effluent trading, within the TMDL framework. While we support the concept of effluent trading, we do have concerns about how EPA intends for it to be implemented. For instance, in comments submitted to EPA on September 6, 1996 on EPA's Draft Framework for Watershed-Based Trading (May 1996), we pointed out that the proposed framework was overly prescriptive and, as a result, would likely significantly restrict watershed-based trading in California. A few of the barriers to trading we identified in the draft framework include: provisions limiting the duration of trades to the five year term of NPDES permits; limitations on the effect of trades on existing effluent limits, compliance schedules or enforcement actions; discouragement of trading for toxic pollutants; and inequitable requirements for point sources to demonstrate a "reasonable assurance" that a trade will be successful. We recommend that EPA include language in the Preamble to the CTR emphasizing a flexible approach to both TMDLs and effluent trading; that trading is voluntary for all involved parties; and that interim limits will be placed in NPDES permits while the necessary ambient data arc gathered and analytical tools are developed.

Response to: CTR-035-032a

EPA appreciates the commenter's support of the preamble discussion concerning the State's use of cooperative approaches toward the development of TMDLs and concerning the State's use of innovative alternatives to traditional "pounds per day" TMDLs. The commenter suggests that EPA expand the reference to include the concept of "quantifiable targets", under which "TMDLs could be expressed as a mass loading, a concentration, a percent reduction, an ecosystem improvement, or a degree of implementation of a control measure". Currently, TMDLs must be established to implement the applicable water quality standard and may be expressed in terms of mass per time, toxicity, or other appropriate measure (40 CFR 130.2(i)). Other appropriate measures include mass loading, concentration, or other indicators. The analysis supporting the TMDL must describe how the TMDL will result in the attainment of water quality standards; numeric targets are usually included in calculations to interpret applicable standards and provide the basis for TMDL calculations. Although implementation of control measures or best management practices (BMPs) will often be a component of the State's TMDL implementation plan, degree of BMP implementation will not suffice as a TMDL because this approach does not clearly demonstrate that water quality standards will be attained. Moreover, since the manner of BMP implementation often determines the effectiveness of the BMP (i.e. there is a high degree of uncertainty in the effectiveness of the BMP), the use of such a "quantifiable target" would require the use of a prohibitively large margin of safety and thus, may be infeasible. These issues, however, are beyond the scope of the CTR, and rules for TMDLs may change.

The commenter also recommends that EPA include language in the preamble emphasizing a flexible approach to both TMDLs and effluent trading; that trading is voluntary for all parties; and that interim limits will be placed in NPDES permits while the necessary data and analytical tools are developed. The preamble to the proposed rule summarized the available flexibility in both TMDLs and effluent trading, as well as supported the State's use of interim permit limits during the development of TMDLs. EPA agrees that effluent trading should be voluntary and believes that TMDLs can provide the analytical framework to support trades. However, as noted above, this is beyond the scope of the CTR, and rules for TMDLs may change.

Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits." EA at.pg. 4 (emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself does not mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Total Maimum Daily Loads (TMDLs)

The majority of the discussion of TMDLs contained in the Preamble to the CTR is merely a reiteration of the requirements of the Clean Water Act (CWA) and the existing regulations. See CTR at pg. 42185-6; see accord 33 U.S.C. section 1313(d)(1)(C) and 40 C.F.R. section 130.7. However, the Preamble discussion also contains recommendations regarding the implementation of TMDLs that merit some review.

First, EPA recommends that, since the TMDL process can be significantly labor and data intensive, collaborative efforts to establish TMDLs on water quality limited water bodies should be pursued. EPA envisions that this collaborative effort by dischargers, the State, EPA, and other stakeholders, could distribute work and associated costs between the interested parties, as well as shorten the overall time necessary to complete the analysis. See CTR at pg. 42185-6. This language attempts to alter the current statutory and regulatory language requiring that States must perform TMDLs, which are then submitted for EPA approval. If EPA is now proposing to allow other entities or coalitions to be able to establish TMDLs, this authority must be placed in the language of the rule itself, if not in an amendment to the CWA.

Second, EPA recommends innovative alternatives to traditional "pounds per day" TMDLs. The regulations and EPA guidance reviewed regarding TMDLs did not mention whether TMDLs had to be established as "pounds per day." The regulations define of "load" as "an amount of matter . . . that is introduced into a receiving water" (40 C.F.R. section 130.2(e)) and discuss TMDLs in terms of either mass per time, toxicity, or other appropriate measure" (40 C.F.R. section 130.2(i)). These definitions

seem to be flexible enough to allow for EPA's recommended alternatives to "traditional pounds per day TMDLs."

A third recommendation pertained to effluent or pollutant trading. In the Preamble to the CTR, EPA encourages innovative approaches such as effluent trading as a method to attain and/or maintain water quality standards. The Preamble at page 42185 describes effluent trading as follows:

Effluent trading allows sources that can control pollutants beyond compliance with current requirements to sell or trade credits for its excess reduction to another source unable to control its own pollutants as effectively or as efficiently. The goal of an effluent trading program is to achieve similar or improved environmental results in a more cost-effective manner than under current regulatory structures. EPA's most current policy on effluent trading is summarized in the "Policy Statement for Effluent Trading in Watersheds" which was issued in January of 1996 and which reiterates President Clinton's commitment to effluent trading as expressed in the March 16, 1995 report on "Reinventing Environmental Regulation." The Policy states that "EPA will work cooperatively with key stakeholders to find sensible, innovative ways to meet water quality standards quicker and at less cost than traditional approaches alone." The policy outlines several different types of trades that may take place. These trades include but are not limited to the following: (1) Intra-plant trading between outfalls within one facility; (2) pretreatment trading between indirect industrial point sources that discharge to a POTW; (3) point to point source trading, point to nonpoint source trading, and nonpoint to nonpoint source trading.

The existing regulations and EPA guidance relating to TMDLs already contemplate some form of pollutant trading.(*3) However, the regulations currently do not specifically allow the degree of trading outlined in the Preamble. To clarify that this is now EPA policy, EPA should propose language to that effect within the regulatory language itself.

The final recommendation EPA makes related to TMDLs addresses the use of interim permit limits when a TMDL/WLA/LA or other special study is underway but not completed. The Preamble gives guidance on how interim limits should be calculated. EPA states that "pastperformance and future uncertainty can be considered as factors in determining interim permit limits, however, permitting authorities may consider other factors, particularly factors concerning the water quality of the receiving water body and the overall goal to attain the water quality standard." EPA further states that it supports innovative ideas such as using specific method for determining interim limits and "trigger" concentrations above which corrective action would be necessary. Furthermore, EPA notes that the State, as the permitting authority, has broad discretion in determining how interim permit limits should be ascertained in different situations. CTR Preamble at pg. 42184-5. This language is helpful, but it should be placed into the rule so that it has the force of law and may be utilized as such.

As a final note regarding the use of TMDLs as a form of regulatory relief, it should be noted that the use of less restrictive effluent limitations based on TMDLs and interim limits is limited by the TMDL process itself as well as the antibacksliding provisions of the CWA. EPA guidance recognized these facts in its TMDL guidance with the following statement:

In developing a TMDL it is important to keep in mind certain constraints on the WLA [wasteload allocation] portion that are imposed by antibacksliding regulatory provisions. The WLA will normally result in new or more stringent water quality-based limits that those contained in a previously issued permit. In a limited number of cases, however, it is conceivable that less stringent water quality-based limits could result. In these cases, permit limits must conform to the antibacksliding provisions contained in section 402(o) of the CWA.(*4)

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*3) See 40 C.F.R. section 130.2(i) ("If Best Management Practices (BMPs) or other nonpoint source pollution controls make more stringent load allocations practicable, then wasteload allocations can be made less stringent. Thus, the TMDL process provides for nonpoint source control tradeoffs."); see also EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 51 (April 1991).

(*4) EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 20 (April 1991) (emphasis added).

It should be noted that the actual language of the rule itself does not mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Total Maimum Daily Loads (TMDLs)

The majority of the discussion of TMDLs contained in the Preamble to the CTR is merely a reiteration of the requirements of the Clean Water Act (CWA) and the existing regulations. See CTR at pg. 42185-6; see accord 33 U.S.C. section 1313(d)(1)(C) and 40 C.F.R. section 130.7. However, the Preamble discussion also contains recommendations regarding the implementation of TMDLs that merit some review.

First, EPA recommends that, since the TMDL process can be significantly labor and data intensive, collaborative efforts to establish TMDLs on water quality limited water bodies should be pursued. EPA envisions that this collaborative effort by dischargers, the State, EPA, and other stakeholders, could distribute work and associated costs between the interested parties, as well as shorten the overall time necessary to complete the analysis. See CTR at pg. 42185-6. This language attempts to alter the current statutory and regulatory language requiring that States must perform TMDLs, which are then submitted for EPA approval. If EPA is now proposing to allow other entities or coalitions to be able to establish TMDLs, this authority must be placed in the language of the rule itself, if not in an amendment to the CWA.

Second, EPA recommends innovative alternatives to traditional "pounds per day" TMDLs. The regulations and EPA guidance reviewed regarding TMDLs did not mention whether TMDLs had to be established as "pounds per day." The regulations define of "load" as "an amount of matter that is introduced into a receiving water (40 C.F.R. section 130.2(e)) and discuss TMDLs in terms of either mass per time, toxicity, or other appropriate measure" (40 C.F.R. section 130.2(i)). These definitions seem to be flexible enough to allow for EPA's recommended alternatives to "traditional pounds per day TMDLs."

A third recommendation pertained to effluent or pollutant trading. In the Preamble to the CTR, EPA encourages innovative approaches such as effluent trading as a method to attain and/or maintain water quality standards. The Preamble at page 42185 describes effluent trading as follows:

Effluent trading allows sources that can control pollutants beyond compliance with current requirements to sell or trade credits for its excess reduction to another source unable to control its own pollutants as effectively or as efficiently. The goal of an effluent trading program is to achieve similar or improved environmental results in a more cost-effective manner than under current regulatory structures. EPA's most current policy on effluent trading is summarized in the "Policy Statement for Effluent Trading in Watersheds" which was issued in January of 1996 and which reiterates President Clinton's commitment to effluent trading as expressed in the March 16, 1995 report on "Reinventing Environmental Regulation." The Policy states that "EPA will work cooperatively with key stakeholders to find sensible, innovative ways to meet water quality standards quicker and at less cost than traditional approaches alone." The policy outlines several different types of trades that may take place. These trades include but are not limited to the following: (1) Intra-plant trading between outfalls within one facility; (2) pretreatment trading between indirect industrial point sources that discharge to a POTW; (3) point to point source trading, point to nonpoint source trading, and nonpoint to nonpoint source trading.

The existing regulations and EPA guidance relating to TMDLs already contemplate some form of pollutant trading.(*3) However, the regulations currently do not specifically allow the degree of trading outlined in the Preamble. To clarify that this is now EPA policy, EPA should propose language to that effect within the regulatory language itself.

The final recommendation EPA makes related to TMDLs addresses the use of interim permit limits when a TMDL/WLA/LA or other special study is underway but not completed. The Preamble gives guidance on how interim limits should be calculated. EPA states that "past performance and future uncertainty can be considered as factors in determining interim permit limits, however, permitting authorities may consider other factors, particularly factors concerning the water quality of the receiving water body and the overall goal to attain the water quality standard." EPA further states that it supports innovative ideas such as using specific method for determining interim limits and "trigger" concentrations above which corrective action would be necessary. Furthermore, EPA notes that the State, as the permitting authority, has broad discretion in determining how interim permit limits should be ascertained in different situations. CTR Preamble at pg, 42184-5. This language is helpful, but it should be placed into the rule so that it has the force of law and may be utilized as such.

As a final note regarding the use of TMDLs as a form of regulatory relief, it should be noted that the use of less restrictive effluent limitations based on TMDLs and interim limits is limited by the TMDL process itself as well as the antibacksliding provisions of the CWA. EPA guidance recognized these facts in its TMDL guidance with the following statement:

In developing a TMDL it is important to keep in mind certain constraints on the WLA [wasteload allocation] portion that are imposed by antibacksliding regulatory provisions. The WLA will normally result in new or more stringent water quality-based limits that those contained in a previously issued permit. In a limited number of cases, however, it is conceivable that less stringent water quality-based limits could result. In these cases, permit limits must conform to the antibacksliding provisions contained in section 402(o) of the CWA.(*4)

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and

$500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*3) See 40 C.F.R. section 130.2(i) ("If Best Management Practices (BMPs) or other nonpoint source pollution controls make more stringent load allocations practicable, then wasteload allocations can be made less stringent. Thus, the TMDL process provides for nonpoint source control tradeoffs."); see also EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. Comment: The Preamble to the California Toxics Rule (CTR), and the rules accompanying Economic Analysis (EA), place a great deal of emphasis on the ability of dischargers to use alternative regulatory approaches to comply with CTR criteria if the cost of treatment technology was prohibitively expensive. For example, the EA assumes that, if the estimated annualized cost for removing a pollutant exceeded a cost trigger,(*1) "dischargers would explore the use of alternative regulatory approaches to comply with CTR-based effluent limits. EA at.pg. 4(emphasis added). Based on this assumption, no treatment cost was estimated for the facility.(*2)

The types of alternative regulatory approaches assumed available for dischargers in California include phased total maximum daily loads (TMDLs), water quality standard variances, site-specific criteria, change in designated use, and alternative mixing zones. EA at pg. 4-5. The following sections will discuss each of EPA's proposed methods for regulatory relief and explain whether or not these methods can truly be used to provide relief from the CTR-based permit limits as anticipated by EPA. It should be noted that the actual language of the rule itself does not mention any of the methods of regulatory relief. Therefore, this analysis will be based solely upon the language contained in the Preamble to the CTR.

Total Maimum Daily Loads (TMDLs)

The majority of the discussion of TMDLs contained in the Preamble to the CTR is merely a reiteration of

the requirements of the Clean Water Act (CWA) and the existing regulations. See CTR at pg. 42185-6; see accord 33 U.S.C. section 1313(d)(1)(C) and 40 C.F.R. section 130.7. However, the Preamble discussion also contains recommendations regarding the implementation of TMDLs that merit some review.

First, EPA recommends that, since the TMDL process can be significantly labor and data intensive, collaborative efforts to establish TMDLs on water quality limited water bodies should be pursued. EPA envisions that this collaborative effort by dischargers, the State, EPA, and other stakeholders, could distribute work and associated costs between the interested parties, as well as shorten the overall time necessary to complete the analysis. See CTR at pg. 42185-6. This language attempts to alter the current statutory and regulatory language requiring that States must perform TMDLs, which are then submitted for EPA approval. If EPA is now proposing to allow other entities or coalitions to be able to establish TMDLs, this authority must be placed in the language of the rule itself, if not in an amendment to the CWA.

Second, EPA recommends innovative alternatives to traditional "pounds per day" TMDLs. The regulations and EPA guidance reviewed regarding TMDLs did not mention whether TMDLs had to be established as "pounds per day." The regulations define of "load" as "an amount of matter that is introduced into a receiving water (40 C.F.R. section 130.2(e)) and discuss TMDLs in terms of either mass per time, toxicity, or other appropriate measure" (40 C.F.R. section 130.2(i)). These definitions seem to be flexible enough to allow for EPA's recommended alternatives to "traditional pounds per day TMDLs."

A third recommendation pertained to effluent or pollutant trading. In the Preamble to the CTR, EPA encourages innovative approaches such as effluent trading as a method to attain and/or maintain water quality standards. The Preamble at page 42185 describes effluent trading as follows:

Effluent trading allows sources that can control pollutants beyond compliance with current requirements to sell or trade credits for its excess reduction to another source unable to control its own pollutants as effectively or as efficiently. The goal of an effluent trading program is to achieve similar or improved environmental results in a more cost-effective manner than under current regulatory structures. EPA's most current policy on effluent trading is summarized in the "Policy Statement for Effluent Trading in Watersheds" which was issued in January of 1996 and which reiterates President Clinton's commitment to effluent trading as expressed in the March 16, 1995 report on "Reinventing Environmental Regulation." The Policy states that "EPA will work cooperatively with key stakeholders to find sensible, innovative ways to meet water quality standards quicker and at less cost than traditional approaches alone." The policy outlines several different types of trades that may take place. These trades include but are not limited to the following: (1) Intra-plant trading between outfalls within one facility; (2) pretreatment trading between indirect industrial point sources that discharge to a POTW; (3) point to point source trading, point to nonpoint source trading, and nonpoint to nonpoint source trading.

The existing regulations and EPA guidance relating to TMDLs already contemplate some form of pollutant trading.(*3) However, the regulations currently do not specifically allow the degree of trading outlined in the Preamble. To clarify that this is now EPA policy, EPA should propose language to that effect within the regulatory language itself.

The final recommendation EPA makes related to TMDLs addresses the use of interim permit limits when a TMDL/WLA/LA or other special study is underway but not completed. The Preamble gives guidance on how interim limits should be calculated. EPA states that "past performance and future uncertainty can be considered as factors in determining interim permit limits, however, permitting authorities may

consider other factors, particularly factors concerning the water quality of the receiving water body and the overall goal to attain the water quality standard." EPA further states that it supports innovative ideas such as using specific method for determining interim limits and "trigger" concentrations above which corrective action would be necessary. Furthermore, EPA notes that the State, as the permitting authority, has broad discretion in determining how interim permit limits should be ascertained in different situations. CTR Preamble at pg, 42184-5. This language is helpful, but it should be placed into the rule so that it has the force of law and may be utilized as such.

As a final note regarding the use of TMDLs as a form of regulatory relief, it should be noted that the use of less restrictive effluent limitations based on TMDLs and interim limits is limited by the TMDL process itself as well as the antibacksliding provisions of the CWA. EPA guidance recognized these facts in its TMDL guidance with the following statement:

In developing a TMDL it is important to keep in mind certain constraints on the WLA [wasteload allocation] portion that are imposed by antibacksliding regulatory provisions. The WLA will normally result in new or more stringent water quality-based limits that those contained in a previously issued permit. In a limited number of cases, however, it is conceivable that less stringent water quality-based limits could result. In these cases, permit limits must conform to the antibacksliding provisions contained in section 402(o) of the CWA.(*4)

(*1) This coat trigger is $200 per toxic pounds-equivalent for a facility under the low-end scenario, and $500 per toxic pounds-equivalent for a category of dischargers under the high-end scenario. See EA at pg. 4.

(*2) In addition, pollutant load reductions were not calculated or credited for any pollutant for which an alternative regulatory approach was pursued. Id.

(*3) See 40 C.F.R. section 130.2(i) ("If Best Management Practices (BMPs) or other nonpoint source pollution controls make more stringent load allocations practicable, then wasteload allocations can be made less stringent. Thus, the TMDL process provides for nonpoint source control tradeoffs."); see also EPA, Guidance for Water Quality-based Decisions: The TMDL Process, EPA Doc. No. 440/4-91-001 at pg. 51 (April 1991).

Response to: CTR-054-043

In response to the commenter's discussion concerning TMDLs with respect to the collaborative approach, alternatives to traditional "pounds per day" TMDLs, effluent and/or pollutant trading, and the use of interim permit limits, see response to CTR-004-006.

Comment: Implementation

Although the proposed Rule discusses implementation issues such as TMDLs, variances, SSOs, and interim permits, it lacks evidence of support for any of these provisions. We believe that this will have the effect of reducing the State's confidence or perceived authority in granting any of these provisions to individual POTWs. For example, Page 42186 of the CTR lists six criteria that must be used by the State to determine the non-attainability of a water quality standard; we are doubtful that any of these criteria would be strictly applicable to our facilities with respect to lindane and DDT. We believe CTR variance criteria should include economic considerations for specific discharger implementation efforts. Unless the EPA provides more support for these provisions, we fear that the State will either not grant us a legitimate variance or will waiver in its commitment to act at all.

Response to: CTR-057-010a

EPA disagrees with the comment that although the preamble discusses implementation issues, it lacks evidence of support for any of them. The CTR preamble section to the proposed rule entitled "Implementation" discusses EPA's general policy on TMDLs, variances, and interim permit limits. EPA's intention for including the discussions is to clearly state that it supports the State's appropriate use of the action as an implementation tool, not to discourage the use of the action in any way. EPA does not believe that its discussion in the preamble would discourage the State in any way, and in fact would facilitate the appropriate use of the provision.

Comment: TMDLs. WSPA recognizes that the law requires the state to adopt TMDLs for those waters which fail water quality standards and are listed on the 303(d) list. WSPA supports the TMDL process based on the following approach:

* Waters should only be listed after careful review of the standards and careful assessment of actual water quality. WPSA does not support the universal application of "independent applicability". In some cases independent applicability is appropriate but in many cases it is overkill and EPA should give states flexibility in applying it. * For metals and many organics, the decision to list should be based on the bioavailable (e.g., dissolved) fraction, not total. * A careful process of prioritization should be encouraged. Also, reasonable schedules for implementing TMDL programs must be established. EPA and the states should be moving expeditiously to set such schedules so that the courts do not take the decision-making process out of their hands. * Today, nearly everybody recognizes that non-point sources

rather than point sources are the major problem for most impaired waters. EPA should supply additional tools to the states for dealing with nonpoint sources, and EPA should encourage the emphasis on those sources, whether point or nonpoint, which are the major source of the problem. * Resolution of TMDLs into load and waste load allocations should be based on sound science. Allocations and permit limits should not be largely a political response to the perceived problem. * The relative impact of more stringently regulating point sources should be considered in establishing a strategy. For example, if point sources are 10% of the problem, it may be inappropriate to call for a 50% reduction in their discharges if a 5% overall reduction will have no meaningful impact-on improving the receiving water quality. WSPA believes that airborne deposition in some cases plays a significant role in water quality, and that regulating point sources in such scenarios is often unlikely to produce meaningful results. TMDLs should instead focus on situations where a real impact on receiving water quality can be made through regulation of dischargers (point or nonpoint).

Response to: CTR-058-011

The commenter, in discussing TMDLs, states that waters should only be listed under section 303(d) after a review of the water quality standards and an assessment of "actual water quality". Issues concerning TMDLs are outside the scope of the CTR, and rules concerning TMDLs may change. However, the State should regularly review applicable water quality standards, but EPA does not believe that such a review is a required as part of the decision to list a water body. With respect to the issue of "independent applicability", the statute and regulations require the State to list waters when water quality standards are not being met. In the case of numeric water quality standards, the State may be able to determine whether water quality standards are being met solely on the basis of ambient water column data. In the case of narrative standards, the State may need to consider other available physical, toxicological, and biological data.

It appears that the commenter believes that some 303(d) listing decisions have been based on "best professional judgement" with no supporting ambient data. Although professional judgment plays an important role in any water quality assessment, EPA agrees that decisions to list waters generally should be based on available physical, chemical, and biological data. The commenter and other interested stakeholders can make a substantial contribution to the collection of monitoring data to support the State's assessment of water quality.

The commenter also states that the decision to list should be based on the bioavailable (e.g. dissolved) fraction, not the total, of metals and many organics. As noted above, the State's decision to add a water body/pollutant to the 303(d) list is based on whether the applicable water quality standard is being exceeded. National guidance on 303(d) listing does not allow waters to be excluded from consideration based on the manner in which existing applicable standards are expressed or the fact that standards revisions are currently underway.

EPA agrees with the commenter that a careful process for prioritization and schedules for implementing the TMDL program should be established. The EPA- approved State guidelines for the 1998 303(d) list update provide for specific criteria to guide prioritization. The State will develop a schedule for completion of TMDLs for all 303(d) listed water bodies (see 1998 Clean Water Act 303(d) Listing Guidelines for California).

EPA agrees with the commenter that additional tools should be provided to the State to address nonpoint source pollution problems. EPA's "Clean Water Action Plan" provides a framework for coordination of Federal activities, especially as it relates to nonpoint source problems. Lastly, as noted above, TMDLs and issues concerning TMDLs are outside the scope of the CTR, and rules and policies concerning

TMDLs may change.

Comment: CDA's primary concerns are with the potential for additional regulation of wastewater discharges from dental offices to POTWS. Several municipalities in the Bay Area, including the City of San Francisco, have informed CDA that dentist offices are considered a source of mercury discharges to municipal sewer systems, and under the Basin Plan will be subject to additional regulation when lower effluent limits are imposed in municipal NPDES permits. Yet, very little is known about the fate, transport, bioavailability and overall water quality impacts of amalgam related mercury.

CDA in cooperation with San Francisco, has developed a comprehensive program of pollution prevention practices (best management practices) for dental offices that has been distributed statewide and is in the process of being implemented. Yet efforts continue by municipalities in parts of the State, such as San Francisco Bay, to impose increasingly stringent and costly controls on dental offices. Within the current point source regulatory structure. POTWs that have mercury compliance problems, or perceive that they might have if the criteria become more stringent (e.g. through loss of dilution credit), are forced to continue to look "upstream" for additional sources to control, until such time, as recommended, as a more comprehensive watershed based approach is allowed.

CDA is a strong supporter of water quality and human health protection. CDA's primary goals in commenting on the draft CTR are to request that mercury criteria be based on sound science and that mercury regulation be implemented via a watershed management, phased TNML-type approach. CDA is particularly concerned that the CTR does not adequately assess the economic impacts on indirect dischargers nor the extent to which there will be measurable water quality benefits solely from adoption of the proposed mercury criteria for point sources.

Watershed Management Based Approach

Data show that there are elevated levels of mercury in San Francisco Bay waters, sediments, and some fish tissue. It is critical to have a better understanding of watershed-wide mercury inputs, fate, transport, and biogeochemical transformations affecting the San Francisco Bay food chain and human health, and the feasibility and costs of alternative control measures, before imposing potentially onerous control measures (through POTWS) on indirect dischargers, such as dentists, that may not provide measurable water quality or human health benefits.

Since POTWs are only responsible for contributing 1-10% of the toxics mass loading (including mercury) to San Francisco Bay (p. 7-7 EA) it makes economic sense to focus limited public resources on identification of larger and potentially more cost-effective sources to control. Since dentists likely

represent a very minor and declining fraction of the mercury loading to POTWs (due to implementation of BMPs and substitution of non-mercury based compounds for mercury containing dental amalgam), it makes even more public policy sense to fully evaluate and prioritizeall sources and controls before pursuing additional control measures on indirect dischargers such as dentists. This needs to be conducted on a watershed basis, consistent with various EPA guidance including the August 1997 Robert Perciasepe TMDL Policy memorandum and the San Francisco Bay Regional Board's July 1997 Watershed Management Initiative Guidance.

Response to: CTR-086-001b

In response to the comments concerning the scientific basis of the mercury criteria, the TMDL approach for mercury in San Francisco Bay, and the economic assessment of impacts on indirect dischargers, see response to CTR-086-001a. In response to the comment concerning the watershed management approach to mercury in the Bay, the State has listed mercury in San Francisco Bay on its 303(d) list and has targeted completion of a TMDL for mercury in the foreseeable future.

EPA supports the State's decision and schedule to complete a detailed TMDL for mercury for the San Francisco Bay, and EPA agrees with the commenter that it makes good public policy to evaluate and prioritize sources of and controls for mercury coming into the Bay as soon as possible.

Comment: The draft California Toxics Rule (CTR) is clearly the product of substantial effort by USEPA staff, and we applaud this effort and its intent. On several issues of concern to public utilities, the CTR strikes a good balance between the need to promulgate standards and the need to base those standards on sound science. Examples include the use of dissolved concentrations rather than the total recoverable concentrations for metals, the deferral of human health criteria for arsenic until adequate information is available, and the revision of the human health criterion for mercury. We are also pleased with the CTR's guidance and flexibility, on mixing zones and dilution credits, total maximum daily loads (TMDLs), compliance schedules, and translators.

Response to: CTR-089-001e

EPA appreciates the commenter's support of EPA's preamble discussion of TMDL guidance and flexibility.

Comment: We recommend that:

2. Include in the rule an implementation proposal which states that before a criteria is put into a permit there must first be: an assessment that the pollutant could reasonably interfere with the designated uses of the water; a comprehensive TMDL is done which includes all sources of pollutants to the water body; and a reasonable potential analysis is completed for point source dischargers. Only then, after all of these analyses are completed by the state or EPA should the criteria be converted to a permit limit with the appropriate implementation factors.

Response to: CTR-090-010b

EPA agrees with the commenter that a reasonable potential analysis as well as a determination that the pollutant could reasonably interfere with the designated uses of the water body before a permit limit is placed in a permit for a particular pollutant. The State completes these analyses before a permit limit is placed in a permit. EPA does not agree with the comment that a comprehensive TMDL must be completed on a particular water body for a particular pollutant before the permit limit is placed in a permit for that pollutant. The State is required to protect the beneficial uses of its waters, and thus is required to implement water quality-based effluent limits for particular pollutants which it has knowledge are contributing to preventing the achievement of beneficial uses. EPA agrees, however, that a TMDL for a pollutant may be necessary to comprehensively address a particular problem in a water body.

Comment: Total Maximum Daily Loads (TMDL)

The City firmly endorses language in the preamble discussing the merits of a collaborative approach toward the establishment of TMDLs on water quality limited water bodies. The City agrees that this approach could better distribute costs and resources between regulators and the regulated community, as well as shorten the time necessary to complete the modeling analysis. The City supports innovative alternatives to the traditional TMDL approach of "pounds per day" and encourages the concept of

effluent trading as a method to aftain or maintain water quality compliance. The City further encourages EPA to better define these and related programs in order to facilitate the TMDL process.

Response to: CTR-092-005

EPA appreciates the commenter's support of EPA's preamble discussions concerning the State's use of cooperative approaches toward the development of TMDLs, the State's use of innovative alternatives to the traditional "pounds per day" TMDL, and the concept of effluent trading. Additional guidance concerning these concepts can be found in EPA documents which discuss the TMDL process and the water management approach.

Comment: An Alternative Strategy to Implement the CTR - The CTR will likely result in massive public and private expenditures without yielding measurable or significant environmental benefits. Costs can be significantly reduced with regulatory flexibility and the cost analysis assumes that regulatory relief will be forthcoming when costs become excessive. However, nothing in the preamble nor anything in the State's implementation plan indicates a willingness to provide regulatory relief. On the contrary, the draft rule establishes an unusually cumbersome variance procedure while theState's draft proposal sets out very conservative procedures for WQBELs and waste load allocations (WLAs).

For these reasons, we recommend a go slow approach to both promulgating and implementing the CTR for those toxicants where the best evidence indicates that non-permitted sources are the predominant sources. This approach would:

1. Use the concept of temporary standards based on liberal assumptions such as use of a CRF of 10E-4 or 10E-4.5 until such time that a) problems in tissue concentrations are established; and b) loadings are established within the watershed. 2. Require permitted sources, including storm water sources to thoroughly characterize their discharges for the watershed specific problem contaminants. 3. Require permitted sources including storm water that discharge nontrivial amounts of problem toxicants to participate in or financially support ambient monitoring programs. 4. Require permitted sources including storm water sources, to undertake all reasonable source control efforts for any problem toxicants in their discharge.

The above efforts will continue through the development of Watershed based control measures, including TMDLs where required. For complex watershed the TMDL process could be lengthy, up to 10 years or more.

Such approaches were discussed in the preamble of the Great Lakes Initiative (589 FR 72, April 16, 1993), and are further discussed in a September 10, 1997 EPA HQ draft memorandum "A Watershed Approach for the Achievement of Water Quality Objectives." (Attachment 1) The temporary limits approach would also obviate the massive administrative burdens contained in the proposed variance procedures.

Response to: CTR-090-023a

EPA disagrees with the comment that the CTR will likely result in massive public and private expenditures without yielding significant environmental benefits. The CTR establishes water quality criteria for priority toxic pollutants; these criteria, combined with State adopted beneficial uses, will

create badly needed ambient water quality standards for California's surface waters including fresh and estuarine waters. The State then must implement these standards into its various water quality control programs, including the Federally mandated NPDES permit program. EPA agrees with the comment that costs of implementation of water quality standards into the NPDES permit program may be reduced with more flexible procedures. EPA described several methods in the preamble to the CTR that are available to provide flexibility in the NPDES permit program. EPA does not agree that these methods are cumbersome. The variance procedure outlined in the preamble may be considered somewhat complex, but the procedure does provide relief to those who are willing to undertake the analyses to show its applicability to a particular situation.

EPA appreciates the detailed comment concerning an alternative strategy for implementing CTR-based water quality standards in California. However, the State has the responsibility of implementing the CTR-based standards. Thus, the alternative implementation concepts described in the comment should be considered by the State in its adoption of the statewide implementation plan. For example, the commenter suggests that temporary standards based on liberal assumptions be used until loadings are established in the watershed; that permitted sources thoroughly characterize their discharges for specific problem contaminants; that permitted sources of problem pollutants participate or financially support ambient monitoring programs, and undertake source control efforts. The commenter's suggestions should be considered by the State in its implementation of water quality standards programs.

Comment: pp. 42184-42185 -- Total Maximum Daily Loads (TMDLs) We agree with EPA's statements in the Preamble in support of the recommendations of the Permitting and Compliance Issues Task Force regarding the benefits of collaborative approaches to developing TMDLs. We also endorse the State's and EPA's policy to allow innovative alternatives to traditional "pounds per day" TMDLs, and suggest that EPA expand this reference in the Preamble to include the concept of "quantifiable targets," under which TMDLs could be expressed as a mass loading, a concentration, a percent reduction, an ecosystem improvement, or a degree of implementation of a control measure (such as a best management practice) (see SWRCB, 1995, Part VI).

EPA also encourages the use of innovative approaches such as effluent trading, within the TMDL framework. While we support the concept of effluent trading, we do have concerns about how EPA intends for it to be implemented. For instance, in comments submitted to EPA on September 6, 1996 on EPA's Draft Framework for Watershed-Based Trading (May 1996), we pointed out that the proposed framework was overly prescriptive and, as a result, would likely significantly restrict watershed-based trading in California. A few of the barriers to trading we identified in the draft framework include: provisions limiting the duration of trades to the five year term of NPDES permits; limitations on the effect of trades on existing effluent limits, compliance schedules or enforcement actions; discouragement of trading for toxic pollutants; and inequitable requirements for point sources to demonstrate a "reasonable assurance" that a trade will be successful. We recommend that EPA include language in the Preamble to the CTR emphasizing a flexible approach to both TMDLs and effluent trading; that trading is voluntary for all involved parties; and that interim limits will be placed in NPDES permits while the necessary ambient data arc gathered and analytical tools are developed.

Comment: Page 42185, second column, first paragraph, discusses effluent trading issues. It is important in effluent trading to properly incorporate aquatic chemistry and toxicology into developing the trade arrangements. This issue is discussed in papers on my web site.

Response to: CTR-061-016

EPA agrees with the comment that it is important in effluent trading to properly incorporate aquatic chemistry and toxicology in developing trade arrangements. EPA, in its Draft Framework for Watershed-Based Trading (USEPA, May 1996), states that pollutant chemistry must be reviewed before appropriate trading arrangements can be completed. EPA contemplates that such analyses will be conducted before the State approves any effluent trading arrangements.

Comment: Some of the flexibility that the City highly supports is the water effect ratio investigations to adjust statewide criteria to site-specific conditions; the interim limits concept while special studies are being conducted by the dischargers and other entities; a variance procedure to allow dischargers to achieve progress toward effluent limit attainment without violating applicable water quality standards; dissolved criteria for metals to reflect the toxicological conditions; translators to adjust dissolved criteria to total permit limitations; trading programs to attain and maintain water quality; and a mixing zone that reflects true instream pollutant conditions and that protects beneficial uses.

Response to: CTRH-001-057a

EPA appreciates the commenter's support of EPA's preamble discussion concerning the State's use of effluent trading programs to attain and maintain water quality.

Comment: B. UWAG Strongly Supports EPA's Position on the Application of Antibacksliding During Compliance Periods

UWAG applauds the Agency's decision to recognize that the antibacksliding provisions of section 402(o) of the Clean Water Act "do not apply to revisions to effluent limitations made before the scheduled date of compliance for those limitations." 62 Fed. Reg. at 42,189, col. 2. Permittees should not be subject to antibacksliding provisions until the limits in question come into force at the expiration of the compliance schedule.

Response to: CTR-030-002

EPA acknowledges this support and notes that its position regarding the application of Clean Water Act antibacksliding provisions in the CTR remains unchanged from that of the proposed rule.

Comment: PROVISIONS SDG&E SUPPORTS

EPA has included in the proposed CTR provisions which are reasonable and with which SDG&E supports. These include:

Anti-backsliding during interim limits

The preamble states that the anti-backsliding requirements of CWA Section 402(0) do not apply to revisions to effluent limitations made before the scheduled date of compliance for those limitations (see

62 Fed. Reg. at 42188, Col. 2). SDG&E supports EPA's interpretation.

Response to: CTR-060-003

EPA acknowledges this support and notes that its position regarding the application of Clean Water Act antibacksliding provisions in the CTR remains unchanged from that of the proposed rule.

Comment: In addition we would like to emphasize the followin concerns which greatly impact the Los Angeles County Stormwater Program:

9. The rule should not be adopted as proposed. It should be revised and then reproposed. The above comments and concerns are fundamental and the recommended modifications are necessary for MS4s to achieve compliance with the proposed water quality criteria. We recommend that the USEPA modify the rule to account for the above comments and other comments received from other MS4 dischargers and then redistribute the rule for further review and comment.

Thank you, again for this opportunity. If you have any questions, or would like to discuss these comments or issues further, please contact Gary Hildebrand at (626) 458-5948, Monday through Thursday, 7:00 a.m. to 5:30 p.m.

Response to: CTR-013-009

In response to the comment requesting that EPA re-propose and re-open the public comment period, please refer to response to CTR-005-010.

Comment: OFFER OF ASSISTANCE

We appreciate the opportunity to provide comments to the proposed rule. Overall, we believe the rule should not be adopted as proposed. We would recommend that USEPA modify the rule and redistribute the rule for further review and comment.

During the development of the proposed rule, USEPA failed to meet with the California Stormwater Task Force or any other California group of MS4 dischargers to discuss the propose rule. We believe such a meeting would have been very beneficial for USEPA and the MS4 dischargers. We extend an offer to meet with EPA and other interested parties to resolve the above issues, and other significant issues prior to finalizing the rule.

Thank you again for this opportunity, if you have any questions or would like to discuss these comments or issues further please contact me at (510) 670-5563.

Response to: CTR-027-013a

In response to the comment requesting that EPA re-propose and re-open the public comment period, please refer to response to CTR-005-010. EPA was receptive to stakeholder issues concerning the CTR, during its development. For example, EPA sent out a newsletter to all stakeholders inviting discussion, including the storm water interest groups, during the development of the CTR; EPA also attended all of the State task force groups concerning the State's proposed implementation plan and was available for

discussion of issues at those meetings. EPA subsequently met with several stakeholder groups during the development of the CTR. Stakeholders concerned with storm water did not approach EPA during this time. Since the time the CTR was proposed, to ensure impartiality, EPA has limited its involvement with all stakeholder groups who wish to solely discuss the CTR and its finalization. Stakeholders concerned with storm water issues have approached EPA subsequent to the CTR proposal, and EPA has met with them to discuss permit and compliance issues. EPA is available to meet with you further concerning permits and compliance issues.

Comment: EPA's Economic Analysis is important not only for EPA's rulemaking, but for the SWRCB's promulgation of the State's Implementation Policy. Without significant improvements, we do not believe that EPA's Economic Analysis would comply with the requirements of the state Porter-Cologne Act if used by the SWRCB to support the State Proposal. We propose that EPA and the SWRCB undertake a collaborative process with interested members of the public to revise the Economic Analysis, based on methodologies and assumptions Jointly agreed 91 upon. Such a process was recommended by the Economic Considerations Task Force convened by the SWRCB in 1995, based on the process used in the Bay-Delta process. Guidelines for embarking on a collaborative process were proposed in the Task Force Report (SWRCB, 1995, Section VIII). We believe that this process could result in a mutually acceptable and defensible analysis that both EPA and the SWRCB could use to satisfy their respective rulemaking requirements for economic analysis.

Based on the extensiveness of the modifications we believe EPA should make to both the proposed rule and the accompanying Economic Analysis, we request that EPA re-propose the rule for public review and comment before publishing the CTR as a final rule.

Comment: As others have commented, we also encourage EPA to build on its efforts over the past year to coordinate with the State Water Resource Control Board (SWRCB). In particular, we recommend that in the future the two agencies take such steps as the use of simultaneous comment periods, joint preparation of the economic analysis, and joint final promulgation, much as the "CAL-FED" agencies are doing. Simultaneous comment periods would greatly facifitate review by the public. Development of a joint economic analysis would greatly reduce the time and resources expended by the two regulatory agencies, as well as by stakeholders. Most importantly, EPA and the SWRCB should adopt the CTR and the

State's Implementation Policy at the same time. This will eliminate uncertainties for permit writers and the regulated community as to how the CTR should be implemented, and encourage greater statewide consistency in the implementation of the CTR.

Response to: CTR-059-004b

In response to the comment requesting that EPA re-propose and re-open the public comment period, please refer to response to CTR-005-010. In response to the comment that EPA and the State should jointly prepare an economic analysis and jointly finalize the CTR water quality criteria and the State implementation plan, EPA is proposing criteria an the State is proposing an implementation plan so that the State will have a comprehensive water quality control program in place as soon as possible. EPA and the State have coordinated on the criteria and implementation plan so that EPA believes the two phases of the program will work well together. However, it is more efficient for each agency to move forward with its part, to complete each phase as soon as possible.

Comment: OFFER OF ASSISTANCE

We appreciate the opportunity to provide comments to the proposed rule. Overall, we believe the rule should not be adopted as proposed. We would recommend that USEPA modify the rule and redistribute the rule for further review and comment.

During the development of the proposed rule, USEPA failed to meet with the CaliforniaStormwater Task Force or any other California group of MS4 dischargers to discuss the propose rule. We believe such a meeting would have been very beneficial for USEPA and the MS4 dischargers. We extend an offer to meet with EPA and other interested parties to resolve the above issues, and other significant issues prior to finalizing the rule.

Thank you again for this opportunity, if you have any questions or would like to discuss these comments or issues further please contact me at (510) 670-5563.

Response to: CTR-027-013b

EPA did not meet with the commenter during the development of the California Toxics Rule because the commenter did not ask for a meeting to discuss the rule during this time period. EPA did hold a public meeting on August 2, 1995 which provided an opportunity for all groups, including storm water dischargers, to ask questions or express concerns about the CTR. Since the proposal and subsequent to the commenter's request to meet with EPA, EPA did meet with the California Water Quality Task Force to discuss a related issue to CTR; language in current stormwater permits regarding water quality standards. In addition, EPA held two public hearings, September 18, 1997 in San Francisco and September 19, 1997 in Los Angeles. EPA believes it does understand the concerns of the California Water Quality Task Force and MS4 dischargers as expressed through its written and verbal comments on the CTR. EPA addresses these comments elsewhere in the response to comment document for the rule.

Comment: OUR PROGRAM

The County is one of four agencies comprising the Sacramento Stormwater Management Program. The other three agencies are the cities of Sacramento, Folsom, and Galt. The Sacramento Stormwater Management Program began in June 1990. Since its inception, the Sacramento Stormwater Program has developed into a high quality stormwater program which is being recognized this year by EPA through its first place award to both the County and City of Sacramento in EPA's outstanding Stormwater Management Program, municipal category.

OUR INTERESTS

The comments that follow are based on our interests that the Rule, the Preamble, and the Rule's accompanying analyses accomplish the following goals:

1. Allow municipal stormwater programs to continue their focus on reduction of pollutants to the maximum extent practicable.

2. Satisfy the requirements of applicable Federal laws and regulations.

3. Provide incentives for reasonable actions to address toxic pollutants from all sources within a watershed.

We believe these interests are compatible with those of EPA and other interested par-ties, and we offer to work with all parties to craft a Rule that satisfies these interests.

Response to: CTR-040-001

EPA believes the CTR is consistent with the goals stated in the comments.

Document Date: 09/26/97
Subject Matter Code: P Whole Effluent Toxicity
References:
Attachments? N
CROSS REFERENCES

Comment: Toxicity

While we acknowledge the need for improved sampling and testing protocols for acute and chronic toxicity, we are concerned about the extent of EPA's awareness with respect to test variability and test acceptability criteria. The effects of test organism age and health and variations in effluent quality over the testing period introduce many variables into toxicity assessment results; these variations can only be accounted for through statistical methods of data analysis. Consequently, we believe that the EPA should provide for the use of narrative toxicity criteria when site-specific conditions merit them. Similarly, the use of non-local test species should be viewed with caution since this introduces another variable into the test results. Narrative criteria can also be justified in view of the need for additional toxicity research on standard test species with respect to type of pollutant, especially chlorination by-products and ammonia.

Response to: CTR-057-008

The CTR did not propose either narrative or numeric toxicity criteria, and therefore, issues related to WET are outside the scope of this rule.

Comment ID: CTR-065-006a
Comment Author: Environmental Health Coalition
Document Type: Environmental Group
State of Origin: CA
Represented Org:
Document Date: 09/26/97
Subject Matter Code: P Whole Effluent Toxicity

CROSS REFERENCES C-20

Comment: TOXICITY TESTING

EHC strongly supports inclusion of acute and chronic toxicity tests. However, it is very important that chlorine and ammonia be added to the list of constituents.

Response to: CTR-065-006a

With respect to your comment on the inclusion of acute and chronic toxicity testing, the CTR did not propose either narrative or numeric toxicity testing criteria. As required by Section 303(c)(2)(B), the CTR proposed numeric water quality criteria for priority toxic pollutants, as identified at CWA section 307(a) and for which the Agency has issued CWA section 304(a) criteria guidance. Whole effluent toxicity limits are not within the ambit of section 303(c)(2)(b) and thus are outside the scope of this action.

EPA agrees that acute and chronic toxicity testing is an important component of the water quality-based toxics control program. In EPA's water quality standards regulations, 40 CFR 131.11, EPA encourages states to adopt both numeric and narrative criteria. Narrative criteria can be the basis for limiting toxicity in waste discharges where a specific pollutant can be identified as causing or contributing to the toxicity but there are no numeric criteria in the state standards, or where toxicity cannot be traced to a particular pollutant. Section 131.11(a)(2) requires states to develop implementation procedures to explain how it will ensure the narrative toxic criteria are met.

Comment: CDA's primary concerns are with the potential for additional regulation of wastewater discharges from dental offices to POTWS. Several municipalities in the Bay Area, including the City of San Francisco, have informed CDA that dentist offices are considered a source of mercury discharges to municipal sewer systems, and under the Basin Plan will be subject to additional regulation when lower effluent limits are imposed in municipal NPDES permits. Yet, very little is known about the fate, transport, bioavailability and overall water quality impacts of amalgam related mercury.

CDA in cooperation with San Francisco, has developed a comprehensive program of pollution prevention practices (best management practices) for dental offices that has been distributed statewide and is in the process of being implemented. Yet efforts continue by municipalities in parts of the State, such as San Francisco Bay, to impose increasingly stringent and costly controls on dental offices. Within the current point source regulatory structure. POTWs that have mercury compliance problems, or perceive that they might have if the criteria become more stringent (e.g. through loss of dilution credit), are forced to continue to look "upstream" for additional sources to control, until such time, as recommended, as a more comprehensive watershed based approach is allowed.

CDA is a strong supporter of water quality and human health protection. CDA's primary goals in commenting on the draft CTR are to request that mercury criteria be based on sound science and that mercury regulation be implemented via a watershed management, phased TNML-type approach. CDA is particularly concerned that the CTR does not adequately assess the economic impacts on indirect dischargers nor the extent to which there will be measurable water quality benefits solely from adoption of the proposed mercury criteria for point sources.

Watershed Management Based Approach

Data show that there are elevated levels of mercury in San Francisco Bay waters, sediments, and some fish tissue. It is critical to have a better understanding of watershed-wide mercury inputs, fate, transport, and biogeochemical transformations affecting the San Francisco Bay food chain and human health, and the feasibility and costs of alternative control measures, before imposing potentially onerous control measures (through POTWS) on indirect dischargers, such as dentists, that may not provide measurable water quality or human health benefits.

Since POTWs are only responsible for contributing 1-10% of the toxics mass loading (including mercury) to San Francisco Bay (p. 7-7 EA) it makes economic sense to focus limited public resources on identification of larger and potentially more cost-effective sources to control. Since dentists likely represent a very minor and declining fraction of the mercury loading to POTWs (due to implementation

of BMPs and substitution of non-mercury based compounds for mercury containing dental amalgam), it makes even more public policy sense to fully evaluate and prioritizeall sources and controls before pursuing additional control measures on indirect dischargers such as dentists. This needs to be conducted on a watershed basis, consistent with various EPA guidance including the August 1997 Robert Perciasepe TMDL Policy memorandum and the San Francisco Bay Regional Board's July 1997 Watershed Management Initiative Guidance.

Response to: CTR-086-001a

The commentor's concerns that the CTR would disproportionately impact dental offices makes assumptions about the implementation of the CTR. The implementation of the CTR includes issues that are outside the scope of this rule. The purpose of the CTR is to establish ambient criteria, which define the constituent concentrations that represent a quality of water that supports a particular use. EPA recognizes that both point (including indirect industrial discharges to POTWs) and nonpoint sources may contribute to exceedence of water quality criteria. While EPA encourages the State to take a watershed approach and consider the total and relative loadings from, and the most effective means of controlling, both point and nonpoint sources in developing programs to ensure that criteria are met, the purpose of the CTR is to establish the criteria themselves; not to provide, nor impose, tools for achieving the criteria. The State has primacy in developing its own implementation procedures. The State's proposed implementation procedures can be found in "Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California," September 11, 1997. The State plans to issue a final policy shortly after promulgation of the CTR.

EPA believes that the Economic Analysis does adequately address economic impacts on indirect dischargers based on the use of available data. The EA used available data from San Jose and Sunnyvale based on those cities' projections of pretreatment controls for copper and nickel from industrial sources. EPA's analysis makes reasonable estimates given the uncertainty of whether NPDES permit limits will become more stringent and how POTWs would implement controls on industrial or commercial discharges to POTWs. As stated in the EA, the States and POTWs have a great deal of discretion in implementing these criteria.

Regarding the commentor's request that mercury criteria be based on sound science see responses to category C-1.

Comment: Major Concerns About the Proposed Criteria and Rule

1. The Proposal is Based on Poor Data and Will Not Result in Better Water Quality for California. We

stated that our own attainability analysis and that of BADA show that San Francisco,) will be impacted by this rule. Unfortunately, due to the short time for review, the poor quality of data and basis for statements and assumptions in the proposal and the problem with detection limits we cannot specifically say what will be the cost to Sari Francisco. One analysis tell us it could be $2.3 million per year annualized costs and another analysis tells us it could be much more. We strongly recommend major revision to the proposal and the economic analysis before final promulgation for the following reasons:

This rule will be applied to point source dischargers with NPDES permits and all EPA and State data confirm that the major sources of many of the pollutants of concern in the major waters of California are not point discharges.

Response to: CTR-090-007

The comment claiming the CTR will have a disproportionate burden on point sources deals with implementation of the CTR which is outside the scope of this rule. The purpose of the CTR is to establish ambient criteria, which define the constituent concentrations that represent a quality of water that supports a particular use. EPA discusses the legal bases for the rule in the preamble and elsewhere in the comment response document for the rule. EPA recognizes that both point and nonpoint sources may contribute to exceedence of water quality criteria. While EPA encourages the State to take a watershed approach and consider the total and relative loadings from, and the most effective means of controlling, both point and nonpoint sources in developing programs to ensure that criteria are met, the purpose of the CTR is to establish the criteria themselves; not to provide, nor impose, tools for achieving the criteria. The State has primacy in developing its own implementation procedures. The State's proposed implementation procedures can be found in "Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California," September 11, 1997. The State plans to issue a final policy shortly after promulgation of the CTR.

Regarding the uncertainty of the costs to San Francisco, EPA agrees that economic impacts, due to the the uncertain manner in how the CTR will be implemented by on a site-specific basis, are difficult to predict. However, EPA believes its Economic Analysis provides a reasonable range of potential costs to sample facilities given the available data and the uncertainty of site-specific implementation.

Comment: Source of toxicants - Benefits from adoption of this rule may be minimal as the most serious water quality problems are caused by non-point sources not subject to WQBEL in NPDES permits. For example, the Benefits Document depicts the seven northern California water bodies that currently have DHS health advisories. These water bodies are:

1. Lake Nacimiento 2. Guadalupe and other Santa Clara County Reservoirs 3. Lake Herman 4. Lake Berryessa 5. Clear Lake 6. Kesterton National Wildlife Refuge/Grassland Area 7. San Francisco Bay

The first five areas are all areas contaminated by mercury from historical mercury mines. Between the late nineteenth century to about 1965, the central coast ranges from San Luis Obispo County north to Lake County provided 70% of the domestic production of elemental mercury. The dominant ore was cinnabar, (HgS) which was found typically in shallow deposits within serpentine and other Franciscan formation rocks. Many abandoned mercury mines with their attendant calcined waste dumps and contaminated main facilities are found throughout this area. Construction and maintenance of access roads to these mines could also mobilize considerable mercury through increased erosion.

Natural releases of mercury either through seismic or geothermal activity may be a significant portion of the mercury problem in some parts of Clear Lake. Sediment deposits dated to 8,800 years ago show mercury concentrations up to 65 mg/kg. Geothermal activity also occurs within the catchment for Lake Beryessa.

(For a good discussion of the mercury problem in the Coast Ranges, see Hood, Michael, etal, Mining Waste Study -Final Report, University of California, Berkeley, July 1, 1988, prepared for the SWRCB, pages 243, et seq. and pages 275 et seq.).

No part of this mercury problem can be attributed to either POTWs or currently active industries. Nor will anything in the CTR provide additional tools to assist in the remediation of the correctable portions of these mercury problems.

The sixth site is Kesterson Reservoir, contaminated by selenium, from surface and sub-surface agricultural drains. Again state efforts to remediate this problem are underway and will not change as a result of the CTR.

The seventh area is San Francisco Bay. Portions of the Bay have elevated levels of mercury, PCBS, dioxin and pesticides. EPA acknowledges that NPDES permitted point sources typically account for between 4 % and 1 1 % of most of the problematic toxicants.

Whether these percentages hold true for the chlorinated organic compounds is difficult to establish as many potential sources are not well characterized due to analytical problems. Nevertheless, it is unlikely that POTWs and industrial point sources are anything other thanminor contributors of the chlorinated hydrocarbon compounds of greatest concern.

The major sources for most of the problem toxicants in the Bay, are, agriculture, abandoned mines, historical contaminated sediments and both urban and nonurban runoff. These major sources will be very difficult, and in some cases impossible, to control. Therefore, even if permitted point sources achieve full compliance with the CTR, only negligible (<10%) improvement in Bay water quality will result. The CTR must address this critical issue: which toxic pollutants prevent California waters from achieving CWA goals and objectives and what isthe source of these toxicants. This assessment is necessary to determine ff EPA has met its obligations to promulgate new water quality standards necessary to meet the requirements of the Act. [CWA section 303(c)(4)]

Comment: An Alternative Strategy to Implement the CTR - The CTR will likely result in massive public and private expenditures without yielding measurable or significant environmental benefits. Costs can be significantly reduced with regulatory flexibility and the cost analysis assumes that regulatory relief will be forthcoming when costs become excessive. However, nothing in the preamble nor anything in the State's implementation plan indicates a willingness to provide regulatory relief. On the contrary, the draft rule establishes an unusually cumbersome variance procedure while theState's draft proposal sets out very conservative procedures for WQBELs and waste load allocations (WLAs).

For these reasons, we recommend a go slow approach to both promulgating and implementing the CTR for those toxicants where the best evidence indicates that non-permitted sources are the predominant sources. This approach would:

1. Use the concept of temporary standards based on liberal assumptions such as use of a CRF of 10E-4 or 10E-4.5 until such time that a) problems in tissue concentrations are established; and b) loadings are established within the watershed. 2. Require permitted sources, including storm water sources to thoroughly characterize their discharges for the watershed specific problem contaminants. 3. Require permitted sources including storm water that discharge nontrivial amounts of problem toxicants to participate in or financially support ambient monitoring programs. 4. Require permitted sources including storm water sources, to undertake all reasonable source control efforts for any problem toxicants in their discharge.

The above efforts will continue through the development of Watershed based control measures, including TMDLs where required. For complex watershed the TMDL process could be lengthy, up to 10 years or more.

Such approaches were discussed in the preamble of the Great Lakes Initiative (589 FR 72, April 16, 1993), and are further discussed in a September 10, 1997 EPA HQ draft memorandum "A Watershed Approach for the Achievement of Water Quality Objectives." (Attachment 1) The temporary limits approach would also obviate the massive administrative burdens contained in the proposed variance procedures.

Comment: EPA'S PROPOSAL VIOLATES THE REGULATORY FLEXIBILITY ACT

Several of the member agencies of the ACCWP have populations less than 50,000 (Piedmont, Emeryville, Albany) and will be significantly affected by the proposed rule if it results in the adoption of NELs or WLAs in the permit for their discharges. These "small entities" under the Regulatory Flexibility Act ("RFA") are entitled to both initial and final regulatory flexibility analyses under the RFA.

EPA's finding that a substantial number of small entities will not be significantly affected by the proposed rule is arbitrary and capricious given this demonstrated impact. A substantial number of municipalities less than 50,000 in population are currently covered by NPDES permits for their storm water discharges. In addition, EPA's upcoming Phase II storm water regulations maysubstantially expand the universe of small municipalities that will be subject to NPDES permits and, through those permits, to the provisions of the CTR.

Neither the ACCWP, the ACCWP's member agencies or, to our knowledge, any other storm water system that will be subject to this rule, was contacted by EPA in advance of the proposed rulemaking and given a reasonable opportunity to participate in the rulemaking as required by 5 U.S.C. section 609(a). In addition, as a "covered agency" under 5 U.S.C. section 609, EPA must process the proposed rule in accordance with the provisions of that section, including the convening of a review panel, but apparently has failed to do so.

Response to: CTR-001-008b

The Regulatory Flexibility Act generally requires federal agencies to prepare a regulatory flexibility analysis (RFA) that describes the impact of a rule on small entities (small businesses, small organizations and small governmental jurisdictions) whenever an agency promulgates a final rule under section 553 of the Administrative Procedure Act, 5 U.S.C. Section 553. 5 U.S.C. Section 604. Under section 605(b) of the Regulatory Flexibility Act, however, if the head of an agency certifies that a rule will not have a significant economic impact on a substantial number of small entities, the statute does not require the agency to prepare an RFA. Pursuant to section 605(b), the Admininstrator is today certifying that this rule will not have a significant economic impact on a substantial number of small entities for the reasons explained below. Consequently, EPA has not prepared an RFA.

The RFA requires analysis of the economic impact of a rule only on the small entities subject to the rules' requirements. See United States Distribution Companies v. FERC, 88 F.3d 1105, 1170 (D.C. Cir. 1996). ("[N]o [regulatory flexibility] analysis is necessary when an agency determines that the rule will not have

a significant economic impact on a substantial number of small entities that are subject to the requirements of the rule," United Distribution at 1170, quoting Mid-Tex Elec. Co-op v. FERC, 773 F.2d 327, 342 (D.C. Cir. 1985) (emphasis added by United Distribution court).) Thus, the RFA requires that any regulatory flexibility analysis prepared for a final rule must include estimates of "the number of small entities to which a rule will apply." 5 U.S.C. Section604(a)(3). The analysis must also include a description of the recordkeeping, reporting and compliance requirements of the rule, including an estimate of the classes of small entities "which will be subject to the requirements." 5 U.S.C. Section 604(a)(4). In light of these provisions, courts have consistently interpreted the RFA to impose no obligation on an agency to conduct a small entity impact analysis on entities it does not regulate. Motor & Equip. Mfrs. Ass'n v. Nichols, 142 F.3d 449, 467 & n.18 (D.C. Cir. 1998).

The U.S. Court of Appeals for the District of Columbia Circuit recently reaffirmed its conclusion that the RFA does not require an agency to prepare an assessment of the economic impact of a rule on small entities that are not directly affected by a rule. American Trucking Association, Inc. v. U.S. Environmental Protection Agency, (D.C. Cir. 1999). In that case, the court determined that EPA was not required to prepare a regulatory flexibility analysis of the economic impact of a rule on small entities when it promulgated air quality standards under the Clean Air Act. There, EPA had certified that the rule would not have a significant impact on small entities because the air standard did not directly impose requirements on small entities and consequently they were not subject to the rule. Under the Clean Air Act, states regulate small entities through state implementation plans that they are required to develop under the Act. States have broad discretion in determining how to achieve compliance with the standards and may choose to avoid imposing any of the burden of complying with the standards on small entities.

The CTR presents a situation very similar to that described in the American Trucking case. It establishes no requirements that are directly applicable to small entities, and so the agency is not required to conduct a regulatory flexibility analysis under the RFA. (See United States Distribution Companies v. FERC, 88 F.3d 1105, 1170 (D.C. Cir. 1996). The Agency is therefore certifying that today's rule will not have a significant economic impact on a substantial number of small entities, within the meaning of the RFA.

Under the CWA water quality standards program, states must adopt water quality standards for their waters that must be submitted to EPA for approval. If the Agency disapproves a state standard and the state does not adopt appropriate revisions to address EPA's disapproval, EPA must promulgate standards consistent with the statutory requirements. EPA has authority to promulgate criteria or standards in any case where the Administrator determines that a revised or new standard is necessary to meet the requirements of the Act. These state standards (or EPA-promulgated standards) are implemented through various water quality control programs including the National Pollutant Discharge Elimination System (NPDES) program that limits discharges to navigable waters except in compliance with an EPA permit or permit issued under an approved state program. The CWA requires that all NPDES permits must include any limits on discharges that are necessary to meet state water quality standards.

Thus, under the CWA, EPA's promulgation of water quality criteria or standards establishes standards that the state, in turn, implements through the NPDES permit process. The state has considerable discretion in deciding how to meet the water quality standards and in developing discharge limits as needed to meet the standards. In circumstances where there is more than one discharger to a water body that is subject to water quality standards or criteria, a state also has discretion in deciding on the appropriate limits for the different dischargers. While the state's implementation of federally-promulgated water quality criteria or standards may result indirectly in new or revised discharge limits for small entities, the criteria or standards themselves do not apply to any discharger, including small entities.

EPA recognizes that it has undertaken an economic analysis pursuant to E.O. 12866 for this rule. This analysis, however, makes numerous assumptions and does not necessarily predict how the state will implement the criteria. Thus, the economic analysis represents EPA's best estimate of the implementation costs of the rule given the broad flexibility the state has in implementing the criteria.

The CTR, as explained above, does not itself establish any requirements that are applicable to small entities. As a result of EPA's action here, the State of California will need to ensure that permits it issues comply with the water quality standards established by the criteria in today's rule. In so doing, the State will have a number of discretionary choices associated with permit writing. While California's implementation of today's rule may ultimately result in some new or revised permit conditions for some dischargers, including small entities, EPA's action today does not impose any of these as yet unknown requirements on small entities.

Although the statute does not require EPA to prepare a regulatory flexibility analysis when it promulgates water quality criteria which will establish water quality standards for California, EPA has prepared an assessment of potential economic impact. This evaluation focuses on State and local implementation procedures related to the NPDES permit program. This evaluation is included in a document entitled, Implementation Analysis of Ambient Water Quality Criteria for Priority Toxic Pollutants in California which is part of the administrative record for this rulemaking. This document looks at the many implementation procedures of the NPDES permit program that the State implements to control pollutants from point source discharges. The procedures discussed in the document include: methods to calculate water quality-based effluent limits; mixing zones; site-specific translators for metals criteria; compliance schedules; effluent trading; water-effect ratios; variances; designated use reclassification; and site-specific criteria. Each of these implementation procedures may have an effect on how water quality standards, based on the criteria in today's rule, will impact NPDES permit holders. Many of these procedures will lessen impacts on regulated entities.

The document also looks at implementation procedures used in the pretreatment program to control pollutant discharges from dischargers that do not discharge directly but introduce pollutants to publicly owned treatment works (POTWs). These dischargers include retail, commercial, and small industrial facilities that discharge to publicly owned treatment works (POTWs). Local entities have significant flexibility to implement their pretreatment programs. These procedures include: methods to calculate local limits (allocation of pollutants); methods of pollution prevention for various specific sources; pretreatment pollutant trading; methods of low cost pollutant reductions; technical assistance to move toward or achieve zero-discharge; cost accounting to drive down levels of discharges; and a few of the regulatory relief options discussed in the direct discharger section, e.g., compliance schedules.

The discussion illustrates the significant amount of flexibility available to the State and local agencies when implementing the NPDES permit program and pretreatment program and emphasizes that appropriate use of the available implementation tools can greatly affect the impact to many direct and indirect dischargers.

Comment: 5. The proposed rule is inconsistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. The Clean Water Act requires that water quality standards be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and also taking into consideration their use and value for navigation (See CWA section 303(c)(2)(A)). Consistent with this, EPA regulations require that water quality standards be based on identification of where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern. For those identified waters, states must adopt criteria for such toxic pollutants applicable to sufficient to protect the designated use"(See 40 CFR 131.1 1 (a)(2)).

Clearly the intent of both the Act and EPA regulations is that water quality standards be tailored to the characteristics of the waters in question. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider regulatory alternatives, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. In failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act.

Response to: CTR-005-006c

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b, CTR-021-005c (Category E-01c; Executive Order 12866), CTR-036-003a (Category S; Unfunded Mandates Reform Act), and the preamble to the proposed rule.

Comment: In addition, we would like to emphasize the following concerns which greatly impact the Los Angeles County Stormwater Program:

8. The proposed rule applies to all current and future MS4 dischargers, including small communities.

The small communities will be significantly impacted by the proposed rule. In Los Angeles County, 77 of the 85 co-permittee cities are communities with a population of less than 100,000. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies, however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities, however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule(*2) it indicates that there are no small entities to be impacted by the rule and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Therefore, unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: 4. The proposed rule applies to all current and future MS4 dischargers, including small communities. These small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume

that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule(*1), it indicates that there are no small entities to be impacted by the rule, and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Thank you for this opportunity to comment on the proposed CTR. Respectfully,

Lisa Ann Rapp Director of Public Works

Comment: THE PROPOSED RULE DOES NOT COMPLY WITH THE REGULATORY FLEXIBILITY ACT

USEPA's analysis under the Regulatory Flexibility Act and Executive Order No. 12866 that the CTR will not affect a significant number of small entities is simply wrong. Most of the cities which we represent have populations of less than 20,000; many have less than 10,000. As noted by the County of Los Angeles, 77 of the co-permittee cities have populations of less than 100,000. Many of these cities are

primarily residential and with limited tax revenues. Nevertheless the proposed CTR would impose the same financial requirements on these cities as would be imposed on larger entities. These cities do not receive funds from either the State of California or the federal government for their storm water programs or other urban runoff control measures.

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and with an expectation that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit and with the same expectation, Sunnyvale would like to make the following points on its own behalf:

2. Obligation to Assess Alternative Cancer Risk Levels for Human Health-Based Criteria. Sunnyvale is gravely concerned that EPA has used the wrong approach in proposing to establish human health criteria for organic pollutants, particularly those pollutants for which the proposed criteria are below the method level of detection ("MDL"). Sunnyvale recommends that EPA should thoroughly assess all of the potential impacts, including costs and benefits, of the 10E-4 and 10E-5 risk levels before proposing the human health-based criteria. As pointed out in the EOA Letter, there is a significant potential for advancing technology to lower the MDL for many pollutants to the point where laboratory equipment is able to measure some or all of the organic compounds for which EPA is proposing to establish criteria at the new level. It is intuitively obvious that the costs of attaining criteria set at the 10E-6 level will be significantly greater than attainment of a 10E-5 or 10E-4 level, particularly where, as pointed out in the EOA Letter, the only available method of treatment is granular activated carbon. Sunnyvale is concerned that the EA does not adequately address the potential for these costs, and, consequently, does not take these potential costs into account in determining whether to exercise its flexibility in choosing whether to use a 10-4 , 10-5 or 10-6 cancer risk level as the basis for its CTR promulgation.

EPA is required by Executive Order 12866, the Regulatory Flexibility Act and the Unfunded Mandates Reform Act to identify and analyze alternatives to a proposed rule. We cannot understand, therefore, why EPA has done such a cursory analysis in the preamble to the CTR and the EA of the alternatives to the use of the most stringent (10E-6) risk level for establishing criteria for human health effects of pollutants, particularly organic pollutants. EPA cannot base its selection of the 10E-6 level based upon previous regulatory pronouncements by the State of California. Any new determination by the State will be subject to the analytical requirements of Section 13241 of the Porter-Cologne Act and by review by

the Office of Administrative Law. Thus, it is not a foregone conclusion that the State will ultimately select the 10E-6 level. EPA has its own legal requirements to fulfill. Accordingly, we ask that EPA not promulgate the final human health criteria for the pollutants of concern unless and until it has adequately analyzed the costs and other implications of the various alternatives to the 10E-6 level.

In conclusion, we are entirely supportive of many of EPA's innovative approaches towards development of the CTR, particularly as regards the toxic metals. However, we believe tht EPA has needlessly failed to comply with many of its legal obligations, particularly as regards the development of human health-based criteria on cancer risk levels of organic pollutants. We urge the Agency to reconsider its position in the matters covered by this letter (as amplified by the EOA Letter) and the CASA/Tri-TAC letter. Sunnyvale pledges its continued participation in place-based watershed management planning in the South Bay, its cooperation with the Agency in making a success of the WPI, and to an ongoing effort by the Agency and others to reach water quality goals in the South Bay. We thank you for the opportunity to comment on the proposed CTR.

Response to: CTR-021-005d

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and with an expectaton that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit and with the same expectation, Sunnyvale would like to make the following points on its own behalf:

3. Failure to Address Important Stormwater-Related Issues. In addition to its POTW, Sunnyvale is the owner of a system of storm drains which contribute wet weather flows to the South Bay. We are concerned that the EA entirely neglects the potential impacts of the proposed CTR on the storm drains. The EA entirely omits any meaningful analysis ofthe costs of bringing storm drains into compliance with

the proposed CTR, thereby significantly understating the overall costs of the CTR. We believe that this omission is violative of the Agency's legal obligations under the authorities cited in the preceding paragraph.

In addition, we join in the comments being filed by the various other operators of stormwater collection systems to the effect that EPA has overstated the legal requirements for storm drains to comply with numerical criteria.

Response to: CTR-021-006c

For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b, CTR-036-005c (Category E-01c; Executive Order 12866), CTR-036-003a (Category S; Unfunded Mandates Reform Act), and the preamble to the proposed rule.

EPA believes it properly described the potential impact of the implementation of the CTR on storm drains in the preamble to the proposed CTR and in its Economic Analysis. For further discussion see responses to CTR-013-003 and CTR-040-004 (Category J; Stormwater Economics).

Comment: The City of Los Alamitos is particularly concerned that, in promulgating the California Toxics Rule, US EPA has neglected its responsibilities under the Regulatory Flexibility Act (RFA). Specifically, the proposed rule does not present any analysis of its impact on a small entity such as the City of Los Alamitos (Population - 12,425) as required by the RFA.

As a small entity regulated under the municipal stormwater permitting requirements of the Clean Water Act, the proposed rule making will have a profound impact on the City of Los Alamitos. This impact now needs to be explicitly understood before further action is taken on the California Toxics Rule.

Comment: 4. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule(*1), it indicates that there are no small entities to be impacted by the rule, and therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: 9. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems if the proposed criteria are adopted. While most small communities have not conducted discharge characterization studies; it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless EPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule (*3), USEPA indicates that no small entities are impacted by the rule, and, therefore, USEPA did not need to complete an analysis required under the Act. USEPA neglected to address small MS4 communities in California that are currently subject to a MS4 permits, and those smaller communities that may be impacted through Phase II. USEPA should have conducted an analysis on the economic impacts to smaller communities.

Recommendation: Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be promulgated until USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: 11. The proposed rule appears to violate applicable Federal law and regulations. As indicated in the above comments, it appears that the proposed rule is inconsistent with the Regulatory Flexibility Act by not considering the impacts on small entities. The rule also appears to be in conflict with the Clean Water Act by proposing a single set of criteria for all fresh waters instead of adopting criteria for pollutants that could "reasonably be expected to interfere with those designated uses".(*4)

And finally as noted in our comment 3, the rule did not consider the potential cost for MS4s for either a BMP based program or a program designed to meet WQBELS. The Statewide cost for this latter effort may be as high as $7 billion per year. Further discussions are provided on these issues in the responses to the CTR by the counties of Alameda, Orange and Sacramento and are incorporated herein by reference.

Comment: The City is a small community with a population of less than 50,000. We volunteered to participate in the Sacramento Stormwater Management Program as a co-permittee on the NPDES permit because we understood that it was a BMP-based program aimed at reducing the discharge of pollutants to the maximum extent practicable. We are very concerned with the CTR's Preamble statement that municipal stormwater agencies must comply with effluent limitations based on water quality criteria. As the County has stated in its comments, this will result in enormous costs without producing significant environmental benefits.

We are also concerned that the EPA Administrator has certified that the CTR will have no effect on small entities such as the City. Based on the estimated compliance costs prepared by the County and the statewide estimates prepared by the California Storm Water Quality Task Force, the CTR will have significant economic effects on small communities throughout the State. For example, our proportional share of the countywide costs to comply with effluent limitations, based on the proposed water quality criteria, could be over $10 million per year.

We urge EPA to reconsider its position that municipal stormwater discharges must comply with water quality standards. EPA should remove the Preamble statement or clarify that municipal stormwater discharges are only required to reduce the discharge of pollutants to the maximum extent practicable.

Alternatively, EPA must revise its economic analysis to include the costs to municipal stormwater agencies and the EPA Administrator must withdraw her certification and, pursuant to the requirements of the Regulatory Flexibility Act, assess the economic impacts of the CTR on small entities.

Comment: b. If the CTR as proposed in the current draft is applied to municipal storm water dischargers so as to require numeric effluent limitations in municipal stormwater permits, the cost to the public will be phenomenal. In the economic analysis of the CTR, EPA failed to consider these costs, and failed to consider the costs to industrial storm water dischargers as well.

The District Is urban storm water drainage system captures through retention 90% of its annual average runoff, and discharges 90% after detention (1% is directly discharged without treatment). The system cost in 1997 dollars is estimated at $500 million.

The only option available to the District to mitigate violations of the proposed criteria would be to expand system storage to capture 100% of average annual runoff. Increasing system storage by 20,000 acre feet (estimated additional storage required for average years), at the current cost of $11,000-$20,00 per acre foot of storage, would result in a capital expenditure of $220,000,000 to $400,000,000.

Even with this exorbitant investment, in approximately half of the rain seasons storage would be exceeded, and 100% of the discharges would be expected to exceed the dissolved metals criteria noted above.

Smaller cities (under 50,000) in California are currently subject to NPDES municipal storm water discharge permits, and many more will be included upon implementation of the Stormwater Phase II program. EPA's failure to assess economic impacts on small cities would appear to be contrary to the requirements of the Federal Regulatory Flexibility Act.

The District includes in its constituency industrial businesses. The District serves these businesses and assists in the oversight of their pollution prevention and storm water permit compliance efforts. Regardless of EPA' s approach to applying the CTR to municipal storm water permits, industrial storm water dischargers are directly and seriously affected by application of the CTR. EPA's failure to assess these economic impacts on our communities is short-sighted and a breach of good public policy.

Response to: CTR-031-006b

With respect to EPA's compliance with the Regulatory Flexibility Act see response to CTR-001-008b. With respect to the commenter's estimate of its stormwater costs see response to CTR-040-004 (Category J; Stormwater Economics).

Comment: Any continuing ambiguities and inconsistencies among state and federal law, regulation, and official policy will continue to lead to legal challenges and the corresponding drain on public funds. The CTR should not be adopted as proposed. The above comments and concerns are fundamental to accomplishing consistency with the CWA and Regulatory Flexibility Act, and providing for the unique circumstances of regulating municipal storm water dischargers.

Comment: LEGAL ISSUES -- Executive ORder 12866, Unfunded Mandates Reform Act, Regulatory Flexibility Act

* SCAP disagrees with EPA's determination under the Regulatory Flexibility Act that the rule will not have a significant economic impact on a substantial number of small entities. SCAP's membership includes several small entities serving a population of 50,000 or less that may be significantly affected by the CTR. In addition, all, of our members provide sewer services to all or most of the small businesses in their service areas. These businesses potentially will be affected by the proposed rule through increased

regulation of their discharges, increased sewer discharge fees, or both. EPA's conclusion appears to be based on the fact that the one minor municipal discharger that EPA studied had no effluent data for the CTR pollutants, and EPA therefore assumed that no costs would be incurred by any small municipal dischargers in the State. This reasoning is erroneous. We therefore request that EPA revise its Economic Analysis to fully examine the impact of the proposed rule on small entities, to re-analyze significant alternatives to the proposed rule (including those alternatives that would minimize any significant economic impact of the proposed rule on small entities), and to allow for meaningful involvement in the development of the rule by small entities.

Response to: CTR-034-005

EPA did not base its rationale for RFA compliance based on its assessment of the minor discharger in its Economic Analysis for the proposed CTR. With respect to the rationale for EPA's compliance with the Regulatory Flexibility Act see response to CTR-001-008b. The classification of minor and major dischargers is based on flow, not population served. EPA did include additional minor dischargers in its sample for its Final Economic Analysis in order to more accurately assess the potential cost of CTR implementation on minor dischargers throughout California.

Comment: pp. 42191 - 42192 -- The Regulatory Flexibility Act EPA's position that the Regulatory Flexibility Act (5 U.S.C.A. 601 et seq.) does not apply is incorrect. While EPA takes the position (p. 42192) that "the criteria or standards themselves do not apply to any discharger, including small entities," we believe that these statements are erroneous, since, as noted on p. 42182, "once an appropriate numeric criterion is selected for either aquatic life or human health protection, this facilitates the calculation of water quality-based effluent limits and/or total maximum daily loads (TMDLs) for that chemical." In fact, EPA itself oversees State issuance of these permits. EPA's reliance on the United States Distribution case cited at p. 42192 to demonstrate why the requirements of the Regulatory Flexibility Act do not apply is misplaced; that case involved the issue of whether the FERC needed to prepare a regulatory flexibility analysis ("RFA") when issuing its Order No. 636. The court determined that the RFA requirement did not apply in this case because of the statutory language exempting regulatory rulemaking where the agency determines "that the rule will not have a significant economic impact on a substantial number of small entities that are subject to the requirements of the rule. " (88 F.3d 1170) The court went on to note that the FERC did not even have authority to regulate the small entities allegedly affected by the rule. The exemption purportedly established by the United States Distribution case cannot be applied in this instance because the standards in the CTR are required by federal and state law to be implemented directly into NPDES permits, through water quality based effluent limitations calculated directly from the numerical criteria in the rule, as well as through load reductions to comply

with TMDLs derived from the standards. Under the Clean Water Act, every NPDES permit issued in California requires compliance with applicable water quality objectives and this will include those proposed in the CTR. Further, EPA has authority to apply those criteria directly, either by its review and potential veto of state-issued permits or its direct issuance of permits in cases where it has vetoed a state permit under Section 402(a) and (d) of the Clean Water Act. Accordingly, the Regulatory Flexibility Act requires EPA not only to prepare an official RFA, but to comply with the procedural requirements of Section 609(b) of the Act, including the requirement to notify and involve the Chief Counsel for Advocacy of the Small Business Administration.

Comment: Finally, EPA has not met its duties under the Regulatory Flexibility Act (the "RFA"). Under the RFA, federal agencies are required to conduct an initial regulatory flexibility analysis ("IRFA") describing the impact of a proposed regulatory action on small entities. Once more relying on the claim that the proposed rule does not establish criteria that are directly applicable to small entities, EPA states that the mandates of RFA do not apply [62 Fed. Reg. 41160, 42191-92].

This position is contrary to both the letter and the spirit of the RFA. The fact that the toxics criteria contained in the proposed rule must be translated into water quality standards and, in turn, NPDES permit effluent limitations, does not negate the fact that the burden of complying and implementing such toxics criteria ultimately will be borne by individual municipalities and business entities. As noted above, the costs to municipalities alone could run into billion of dollars placing a severe strain on their budgets and forcing them to divert funds currently allocated to other important municipal services, inclusing public safety.

Moreover, EPA's statement that "California will have a number of discretionary choices associated with permit writing" is disingenuous and ironic in light of EPA's rationale for issuing the proposed rule. The toxics criteria will necessarily narrow the State's discretion in issuing NPDES permits and in establishing effluent limits for such permits. If EPA had meant for the State to have any serious discretion, it would not be promulgating these criteria in the first place.

Comment: A further consequence of the flawed economic analysis is the conclusion that the CTR is not a major rule (i.e., one which will result in excess of $100 million per year expenditure) subject to Presidential Executive order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Reform Act. The District, for example, is a small community having a population of under 50,000 and, in addition, serves several small towns and communities (Sonoma, Glen Ellen, Boyes Hot Springs and Agua Caliente) that would be greatly impacted by the proposed rule.

Comment: 5. The proposed rule is inconsistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. The Clean Water Act requires that water quality standards be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, and recreational purposes (see CWA section 303(c)(2)(A)). Consistent with this, EPA regulations require that water quality standards be based on identification of "specific water bodies where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern..." For those identified waters, "states must adopt criteria for such toxic pollutants applicable to the water body sufficient to protect the designated use" (See 40 CFR 131.11(a)(2)). Clearly the intent of both the Clean Water Act and EPA regulations is that water quality standards be tailored to the characteristics of the waters in question. In

failing to properly evaluate the rule's economic impacts and in failing to adequately consider regulatory alternatives, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. Moreover, in failing to properly consider the impacts on small entities, such as the District and the small communities it serves, the rule is inconsistent with the Regulatory Flexibility Act.

Response to: CTR-038-006c

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b, CTR-021-005c (Category E-01c; Executive Order 12866), CTR-036-003a (Category S; Unfunded Mandates Reform Act), and the preamble to the proposed rule.

Comment: 7. Separate, sites-specific aquatic life criteria for copper and human health criteria for mercury should be adopted for Schell Slough, or alternatively EPA should specify implementation procedures for these criteria that will preclude unreasonable controls such as end-of-pipe treatment. To comply with the Clean Water Act and EPA regulations, EPA should consider specific water bodies. To fulfill the spirit of Presidential Executive Order 12866 and the requirements of the Unfunded Mandates Reform Act and the Regulatory Flexibility Act, EPA should evaluate regulatory alternatives based on an analysis of costs and benefits. Based on the assessment of costs and benefits described in "3" above, EPA should either adopt the criteria that is currently achieved, or alternatively specify implementation procedures that would allow the current discharge to continue (e.g., allowable Mixing zones and averaging periods and, for copper, a translator and water-effect ratio). Again, the District is amenable to continuing to address these constituents through pollution prevention measures and to assessing the actual impacts of these constituents in Schell Slough. Without EPA specifying such implementation procedures in the CTR, it is possible that the CTR could impose significant costs on the District (and the other small communities its serves) without providing a commensurate environmental benefit. In that case, the CTR would be inconsistent with the Clean Water Act, EPA regulations, Presidential Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act.

Response to: CTR-038-008c

See response to CTR-038-008a Category C-24; Site-Specific Criteria. See responses to CTR-034-010b and CTR-060-010 (Category C-28; Detection Limits). Comment: 8. EPA should not adopt criteria for any pollutant where the method detection limit exceeds the objective and there is insufficient detectable, reliable data to determine if the pollutant could reasonably be expected to interfere with designated uses. The proposed rule includes criteria for a number of constituents where there is insufficient data to determine whether the discharge of such pollutants could reasonably be expected to interfere with the designated uses. EPA has chosen to promulgate criteria for these constituents even though section 303 (c)(2)(B) of the Clean Water Act requires States to adopt numeric criteria only for constituents "...the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses." Clearly, this "play-it-safe" approach goes beyond the requirements of the Clean Water Act and is therefore unnecessary. By taking this approach, however, EPA is unable to fulfill its duty (under Presidential Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act) to assess the costs, benefits, and impacts of the rule on local government and small entities. While this may be the conservative approach for EPA, it places dischargers throughout the State at risk. As analytical detection limits improve, dischargers may find they are unable to achieve the criteria without costly end-of-pipe controls. But, by then, it will be too late for EPA to evaluate the costs and benefits of the criteria and alternative criteria. For these reasons, EPA must not adopt criteria for those constituents. If EPA does adopt criteria for those constituents, EPA must evaluate the costs and benefits of the criteria, as well as alternative criteria, using worst case assumptions (i.e., assume that discharge levels and ambient levels are at the detection limits). With respect to the District's discharge and Schell Slough and Second Napa Slough, the criteria in this category include, but are not necessarily limited to, the following : benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoroanthene, benzo(k)fluoroanthene, chrysene, dibenzo(a,h)anthracene, aldrin, 4,4'-DDD, 4,4'-DDE, dieldrin, endosulfan I, endosulfan II, endosulfan sulfate, heptachlor, heptachlor epoxide, toxaphene, PCB-1016, OCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, PCB-1260, and hexachlorobenzene (see Table 3).

Response to: CTR-038-009c

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

II. Concern: The economic analysis upon which the Rule is based is seriously flawed.

* A consequence of the cost/benefit analysis of the Rule are several erroneous conclusions, namely that: (1) this is not a "significant regulatory action" or a major rule (i.e., one which will result in excess of $100 million annual expenditure) subject to the requirements contained in Presidential Executive Order 12866 and the Unfunded Mandates Reform Act; and (2) this is not a rule that will have a significant economic impact on a substantial number of small entities protected under the Regulatory Flexibility Act.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

* The cities of Folsom and Galt, co-permittees in our stormwater program, both have populations less than 50,000. Their costs associated with complying with the effluent limitations proposed in the Rule would be significant (on the order of $10 million annually for each city). Therefore, the EPA Administrator's certification that the Rule would have no effect on small entities, pursuant to the requirements of the Regulatory Flexibility Act, is incorrect.

Response to: CTR-040-010b

With respect to EPA's compliance with the Regulatory Flexibility Act see response to CTR-001-008b. With respect to the commenter's estimate of its stormwater costs see response to CTR-040-004 (Category J; Stormwater Economics).

Comment: 3. The California Toxics Rule is inconsistent with the Regulatory Flexibility Act.

The Regulatory Flexibility Act (RFA, 5 U.S.C. section 601 et seq.) requires that each federal agency, including EPA, publish in the Federal Register twice a year a regulatory flexibility agenda which contains a brief description of the subject area of any rule which the agency expects to promulgate which is likely to have a significant economic impact on a substantial number of small entities (includes municipalities with a population of less than 50,000). Because EPA contends that the CTR does not significantly or uniquely affect small entities, EPA does not believe it is required under the RFA to describe the impact of the proposed rule, which accomplish the stated objectives and which minimize any significant economic impact of the proposed rule on small entities.

The EPA Administrator has certified that the rule will not, if promulgated, have a significant economic impact on a substantial number of small entities. However, because the CTR will in fact have a significant economic impact on a substantial number of small entities, the Administrator's certification can be challenged as being arbitrary and capricious under the Administrative Procedures Act. If that challenge were successful, then the CTR could not be re-promulgated until the required final regulatory flexibility analysis has been completed by the Agency.

Furthermore, any small entity that is adversely affected or aggrieved by final CTR is entitled to judicial review of agency compliance with the requirements of the RFA. The judicial relief possible in a challenge made by a small entity is as follows:

- Remand of the rule, and - Deferred enforcement of the rule against small entities unless the courts find that continued enforcement of the rule is in the public interest.

Comment: 8. The proposed Rule is Inconsistent with Applicable Federal Law and Regulations

The proposed rule is inconsistent with applicable Federal law and regulations. In proposing a single set

of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. (See attached Legal Analysis of the Proposed California Toxics Rule) to properly evaluate the rule's economic impacts and in failing to adequately consider alternative criteria for San Francisco Bay Area waters, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act (Id). In failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act (Id).

Thank you for the opportunity to provide comments on this important new rule. Please call if you have any questions regarding our letter.

Response to: CTR-041-013b

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b, CTR-021-005c (Category E-01c; Executive Order 12866), CTR-036-003a (Category S; Unfunded Mandates Reform Act), and the preamble to the proposed rule.

Comment: 5. The proposed rule is inconsistent with applicable Federal law and regulations.

In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. The Clean Water Act requires that water quality standards be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes (see CWA section 303(c)(2)(A)). Consistent with this, EPA regulations require that water quality standards be based on identification of "specific water bodies where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern..." For those identified waters,"states must adopt criteria for such toxic pollutants applicable to the water body sufficient to protect the designated use"(See 40 CFR 131.1 I (a)(2)). Clearly the intent of both the Act and EPA regulations is that water quality standards be tailored to the characteristics of the waters in question. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider regulatory alternatives, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. Moreover, in failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act.

Response to: CTR-043-005c

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b, CTR-021-005c (Category E-01c; Executive Order

12866), CTR-036-xxx (Category S; Unfunded Mandates Reform Act), and the preamble to the proposed rule.

Comment: We have reviewed the proposed CTR and offer the following comments:

4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. Additional concerns with the economic analysis are presented in Exhibit F. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act. The City, for example, is a small community having a population of under 50,000 and would be greatly impacted by the proposed rule.

Comment: We have reviewed the proposed CTR and offer the following comments:

8. EPA should not adopt criteria for any pollutant where the method detection limit exceeds the objective and there is insufficient detectable, reliable data to determine if the pollutant could reasonably be expected to interfere with designated uses. The proposed rule includes criteria for a number of constituents where there is insufficient data to determine whether the discharge of such pollutants could reasonably be expected to interfere with the designated uses. EPA has chosen to promulgate criteria for

these constituents even though section 303 (c)(2)(B) of the Clean Water Act requires States to adopt numeric criteria only for constituents "... the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses." Clearly, this approach goes beyond the requirements of the Clean Water Act and is therefore unnecessary. Additionally, this approach does not allow EPA to fulfill its duty (under Presidential Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act) to assess the costs, benefits, and impacts of the rule on local government and small entities. While this may be the conservative approach for EPA, it places dischargers throughout the State at risk. As analytical detection limits improve, dischargers may find they are unable to achieve the criteria without costly end-of-pipe controls. But, by then, it will be too late for EPA to evaluate the costs and benefits of the criteria-and-consider alternative criteria. For these reasons, EPA should not adopt criteria for those constituents. If EPA does adopt criteria for those constituents, EPA should evaluate the costs and benefits of toxic criteria, as well as alternative criteria, using worst case assumptions (i.e., assume that discharge levels and ambient levels are at the detection limits).

Response to: CTR-044-009c

See responses to CTR-034-010b and CTR-060-010 (Category C-28; Detection Limits). Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our storm water program:

4. The proposed rule applies to all current and future MS4 dischargers, including small communities. The small communities will be significantly by the proposed rule. In California, there are many small communities that are currently co-permittee to MS4 permits. Many of the larger municipalities in California have conducted storm water discharge characterization studies. These studies have shown that there are common pollutants associated with storm-water discharges from urbanized areas that could result in compliance problems with the proposed criteria . Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the USEPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the USEPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule, it indicates that there are no small entities to be impacted by the rule, and, therefore, the USEPA did not need to complete an analysis required under the Act. The USEPA neglected to address small MS4 communities in California that are currently subject to MS4 permits, and those smaller communities that may be impacted through Phase II. The USEPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the USEPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: IV. EPA Has Not Complied With Applicable Regulatory Review Requirements. There are several significant statutes and executive orders that require EPA to undertake analyses of the costs and benefits of its regulations, and to submit the regulations and analyses to other governmental bodies, including the Office of Management and Budget (OMB) and Congress. Those authorities include the Regulatory Flexibility Act, the Small Business Regulatory Enforcement and Fairness Act (SBREFA), the Unfunded Mandates Reform Act, the Congressional Review Act, and Executive Order 12866 (Regulatory Planning and Review). EPA apparently believes that it does not need to comply with any of those requirements for this rulemaking. (62 Fed. Reg. at 42188-42191). API believes that EPA is required to meet those obligations for the proposed criteria, and that the Agency's rationale for avoiding this responsibility has no legal basis.

EPA supports its decision not to comply with the regulatory review statutes by stating that the proposed criteria "by themselves, do not directly impose economic impacts." (62 Fed. Reg. at 42188). EPA admits that when those criteria are combined with the designated uses that have been adopted by the State, and implemented in permit limits, "there may be a cost to some dischargers." (62 Fed. Reg. at 42188) could be substantial; the Agency itself estimates that the compliance cost could be between $15 and $87 million per year.(62 Fed. Reg. at 42189). (That does not include indirect costs to the economy, which would surely put this rule above the $100 million impact threshold specified in several of the regulatory review statutes listed above.) EPA cannot ignore those costs by creating its own interpretation of those statutes in which only "direct" impacts need be considered. There is no support in the statutory language or legislative history for such a reading, and EPA has cited no such support in its Federal Register notice.

There is another problem with EPA's rationale for avoiding regulatory review: if EPA were right that "indirect" impacts do not trigger those reviews, the impacts of this rulemaking are not really "indirect." Those impacts emerge clearly once the proposed criteria are combined with the State's designated uses. Those designations have already been established, so there is nothing uncertain or indefinite about that aspect of the water quality standards. Then, once the standards are completed, the State must implement

those standards through permit limits. While there are some decisions that the State must make in determining the proper permit limits, which can influence the size of the compliance costs, EPA can readily determine a range of possible costs. In fact, the Agency has already done so, resulting in the $15 - $87 million cost range discussed above. While those costs may not be fixed with certainty, they are certainly "direct economic impacts". Therefore, even if the Agency were correct in looking at only "direct" impacts, this rulemaking poses such impacts, and EPA must comply with the statutory requirements to conduct and submit cost and benefit analyses of its proposed criteria.

V. CONCLUSION

As explained above, EPA's proposal to issue water quality criteria for toxicities in the State of California suffers from serious legal flaws. API urges the Agency to reconsider its intended course of action in light of the issues raised in these and other public comments. If you have any questions regarding these comments, or would like any additional information, please call Theresa Pugh at 202/682-8036.

Comment: C. RECOMMENDATIONS FOR MODIFICATIONS TO THE CTR AND EA

EPA should revise the proposed rule and economics analysis such that they are consistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider alternative criteria for San Francisco Bay Area waters, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. In failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act. Specific citations for these inconsistencies are contained in comments from BADA and CASA/Tri-TAC.

Response to: CTR-052-021c

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory

Flexibility Act, see response to CTR-001-008b, CTR-036-005c (Category E-01c; Executive Order 12866), CTR-036-003a (Category S; Unfunded Mandates Reform Act), and the preamble to the proposed rule.

Comment: Separate, scientifically defensible, reasonably achievable aquatic life criteria for copper should be adopted for San Francisco Bay, or alternatively EPA should specify in the Preamble implementation policies for copper that will result in reasonable control measures actions. To comply with the Clean Water Act and EPA regulations, EPA is required to consider specific water bodies. To fulfill the spirit of Presidential Executive Order 12866 and the requirements of the Unfunded Mandates Reform Act, EPA is required to evaluate regulatory alternatives based on an analysis of costs and benefits. Based on BADA's analysis of costs and benefits, EPA should either adopt copper criteria that are reasonably achievable or alternatively specify implementation policies that will avoid costly end-of-pipe controls. Potential implementation measures that could be specified include use of the following in calculating effluent limitations: actual dilution based on modeling studies; copper translators; probability of compliance less than 99.9%; and water-effect ratios determined for different segments of the Bay. Unless EPA specifies these or similar implementation policies in the rule, it is possible that the CTR could result in significant costs ($12 million per year to $78 million per year) while resulting in minor environmental benefit (a 1% reduction in copper loading to the Bay). In that case, the CTR would violate the Clean Water Act, EPA regulations, Presidential Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act. (see the discussion under Item 11 below.)

Response to: CTR-054-008d

Comment: 3. The California Toxics Rule is inconsistent with the Regulatory Flexibility Act.

The Regulatory Flexibility Act (RFA, 5 U.S.C. section 601 et seq.) requires that each federal agency, including EPA, publish in the Federal Register twice a year a regulatory flexibility agenda which contains a brief description of the subject area of any rule which the agency expects to promulgate which is likely to have a significant economic impact on a substantial number of small entities (includes municipalities with a population less than 50,000). Because EPA contends that the CTR does not significantly or uniquely affect small entities, EPA does not believe it is required under the RFA to describe the impact of the proposed rule on small entities or to describe any significant alternatives to the proposed rule, which accomplish the stated objectives and which minimize any significant economic impact of the proposed rule on small entities.

The EPA Administrator has certified that the rule will not, if promulgated, have a significant economic impact on a substantial number of small entities. However, because the CTR will in fact have a significant economic impact on a substantial number of small entities, the Administrator's certification can be challenged as being arbitrary and capricious under the Administrative Procedures Act. If that challenge were successful, then the CTR could not be re-promulgated until the required final regulatory flexibility analysis has been completed by the agency.

Furthermore, any small entity that is adversely affected or aggrieved by final CTR is entitled to judicial review of agency compliance with the requirements of the RFA. The judicial relief possible in a challenge made by a small entity is as follows:

- Remand of the rule, and - Deferred enforcement of the rule against small entities unless the court finds that continued enforcement of the rule is in the public interest.

Comment: The Sanitation Districts disagree with EPA's assertions that the CTR is not a significant regulatory action under Executive Order 12866 or the Unfunded Mandates Reform Act, and that EPA is not required to comply with the Regulatory Flexibility Act because the CTR establishes no requirements

applicable to small entities. We believe the potential costs for POTWs to comply with the CTR criteria would far exceed the $ 100 million threshold, based on the fact that we estimate that the potential costs for seven Sanitation Districts' facilities to comply with the CTR to be nearly $150 million per year. Clearly, many of the 304 other POTWs in the State will also incur costs, as, will other NPDES permittees, indirect dischargers, stormwater dischargers, and nonpoint sources. Thus, EPA's cost figure of $15 - $87 million per year is simply not a credible estimate. Also, it is quite clear that the CTR is likely to adversely affect local governments, including over 40 small communities located in our service area, and that it is significantly different from other federal regulations previously promulgated in California. We believe that EPA has not complied with the mandates of Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act. Accordingly, EPA must revise the economic analysis and it must be reviewed by the Office of Management and Budget and then EPA must select the most cost-effective and least burdensome regulatory alternative.

Comment: Regulatory Flexibility Act

Contrary to EPA's finding in the Preamble that the CTR "establishes no requirements applicable to small entities (p. 4219 1)," we believe that the NPDES permit requirements and TMDLs that will be based on the CTR criteria will apply to small and large entities alike, because, under Section 301 (b)(1)(C) of the Clean Water Act, EPA and States must establish effluent limitations necessary to meet water quality standards. Although the State of California is a delegated NPDES state, EPA has authority to apply the criteria directly, either by its review and potential veto of state-issued permits, or though direct issuance of permits in cases where it has disapproved a state permit under Section 402 of the Clean Water Act. As pointed out by EPA on p. 42165, the scope of the CTR is to "re-establish criteria for the remaining priority toxic pollutants to meet the requirements of section 303(c)(2)(B) of the CWA." Section 303(c)(2)(B) of the Act requires the establishment of water quality standards for toxic pollutants. Thus, EPA is establishing water quality standards, and NPDES permits subsequently issued must contain effluent limitations necessary to meet water quality standards. Thus, EPA's finding is erroneous, and the CTR will establish requirements applicable to small entities.

Of the 78 cities whose Mayors comprise the Sanitation Districts' Board of Directors, 41 are "small communities" with a population of less than 50,000 people.(*1) It is likely that some or all of these communities would be significantly affected if any or all of the Sanitation Districts' water reclamation

plants were required to install expensive treatment facilities as a result of the CTR. EPA must to comply with the requirements of the Regulatory Flexibility Act to address the impacts on small communities such as these. Most, if not all, of these communities, would also be subject to CTR compliance requirements as a result of their responsibilities as co-permittees under the Los Angeles County Municipal Storm Water NPDES Permit.

Under the requirements of the Regulatory Flexibility Act, we therefore believe that EPA is required to prepare initial and final regulatory flexibility analyses that describe the impact of the proposed rule on small entities, identify any significant alternatives to the proposed rule that accomplish the stated objectives, and describe any significant alternatives to the proposed rule that minimize any significant economic impact of the proposed rule on small entities.

(*1)These communities include Vernon, Bradbury, Industry, Irwindale, La Habra Heights, El Segundo, Rolling Hills Estates, Signal Hill, Sierra Madre, Commerce, San Marino, Palos Verdes Estates, Hawaiian Gardens, Santa Fe Springs, Artesia, Hermosa Beach, Lakewood, Lomita, La Canada Flintridge, Duarte, South El Monte, Cudahy, South Pasadena, Maywood, Lawndale, Walnut, La Veme, Temple City, Manhattan Beach, San Ditnas, Bell, West Hollywood, Monrovia, San Gabriel, La Puente, Azusa, Rancho Palos Verdes, Bell Gardens, Covina, and La Mirada.

Comment: In addition, we would like to emphasize the following key issues on the California Toxic Rule (CTR), which are of major impact to our stormwater program:

4. The proposed rule applies to all current and future MS4 discharges, including small communities. The small communities will be significantly impacted by the proposed rule. In California, there are many small communities that are currently co-permittees to MS4 permits. Many of the larger municipalities in California have conducted stormwater discharge characterization studies. These studies have shown that there are common pollutants associated with stormwater discharges from urbanized areas that could result in compliance problems with the proposed criteria. Most small communities have not conducted discharge characterization studies; however, it is reasonable to assume that discharges from small communities would also contain these same pollutants. This would result in a smaller community being faced with the same compliance issues as large and medium municipalities; however, the cost to comply could be more significant and prohibitive for smaller communities.

The Regulatory Flexibility Act requires the U.S. EPA to conduct an analysis on the economic impact the proposed rule may have on small entities, unless the U.S. EPA certifies that the rule will not affect a significant number of small entities. In the preamble to the proposed rule, it indicates that there are no small entities to be impacted by the rule, and, therefore, the U.S. EPA did not need to complete an analysis required under the Act. The U.S. EPA neglected to address small MS4 communities in California that are currently subject to MS4 permits, and those smaller communities that may be impacted through Phase II. The U.S. EPA should have conducted an analysis on the economic impacts to smaller communities.

Unless the preamble is modified to indicate that MS4s are not required to comply with water quality standards, the proposed rule should not be applied to smaller MS4 communities until the U.S. EPA has complied with the requirements of the Regulatory Flexibility Act.

Comment: * The EPA should reevaluate their determination under the Regulatory Flexibility Act that the rule will not have a significant economic impact on a substantial number of small entities. OVSD would be classified as a small entity, serving a population of 25,000, and would be significantly affected by the CTR. OVSD would have to further treat our effluent with reverse osmosis in order to comply with proposed CTR criteria, specifically for copper, nickel, zinc, lindane, and trihalomethanes; modifications to the existing plant would result in estimated increased annualized costs of $1.98 million. These costs are significantly higher than EPA's estimated costs per plant of $27,000 to $480,000 per year. In addition, EPA must consider that OVSD's contingent of small businesses potentially will be affected by the proposed rule through increased regulation of their discharges, increased sewer discharge fees, or product bans. Thus we strongly believe that the EPA's Economic Analysis significantly underestimates the potential statewide costs associated with adoption of the CTR and should be revised.

Comment: Introductory Comment

EPA states in the Executive Summary (page ES-2) to the Economic Analysis that:

"EPA did not calculate costs for any program for which it does not have enforceable authority ... (nor) for NPDES sources which are not typically subject to numeric WQBELs....."

From a national policy perspective, this narrowing, of the focus of the Economic Analysis may be a justifiable approach to cost benefit analysis. Local government, however, is not able to disregard the potential cost effects of the CTR on urban and agricultural runoff. Those potential costs will have to be defrayed with proceeds from the same pool of local rate payers responsible for paying for point source pollutant removal programs. In California, those ratepayers have made clear both their support for environmental protection and their reluctance to pay more than is necessary for that protection. A narrow definition of those costs included in the CTR Economic Analysis continues the pattern of fragmenting responsibility and authority for the protection of waterways, which in turn hinders creation and implementation of holistic strategies which would best serve the environment at least cost.

Questions for EPA on the Introductory Comment

Q.-1) If not EPA, who has the responsibility to define the aggregated costs of all water quality-related regulations?

Q.-2) San Jose's reading of federal policy initiatives (which include, but are not limited to, the Regulatory Flexibility Act, Executive Order 12866, and the Unfunded Mandates Reform Act) indicates that EPA is empowered to analyze the economic impact of federal regulations in a way that addresses both aggregated cost impacts as well as the fiscal reality of local level government. Why was this not accounted for in the current analysis?

Comment: Thank you for the opportunity to comment on the proposed California Toxics Rule. The City's comments are related to five main concepts:

4. The environmental consequences of the necessary treatment facilities and changes in operating practices to meet these discharg5 standards is very significant and has not been addressed in promulgating the proposed rule.

Specifically, the City submits the following comments:

F. A comparison of the Water Quality Standards (WQS) used by its City during the Local Limits Study and the proposed WQS is shown in Table 1. There is a little variation in limits for cadmium, copper, nickel, and zinc as these values are dependent on receiving stream hardness. The values shown in Table I for the City were developed using a hardness of 170 mg/l as CaCO3 while the standards from the CTR are based on 100 mg/l as CaCO3. The WQS from the CTR are actually expressed as dissolved fractions. A factor of I has been used to convert from dissolved to total fractions for the comparison to take place.

Table 1

Comparison of Water Quality Standards

	City Report		WQS		1996		1997	
	Chronic	Acute	Chronic	Acute				
Arsenic, ppb	190.0	360.0	150.0	340.0	Cadmium, ppb	1.7	7.1	2.2
4.3	Chromium, ppb	10.0	15.0	11.0	16.0	Copper, ppb	19.0	29.0	9.0
13.0	Nickel, ppb	250.0	2200.0	52.0	470.0	Zinc, ppb	170.0	180.0	
120.0	120.0	Mercury, ppb	N/A	2.1	.77	1.4			

Table 1 indicates that the City's Local Limits for arsenic, cadmium, chromium, and zinc would have little difficulty meeting the CTR. However, limits for copper, nickel and mercury may be drastically impacted. This impact in developing a stricter local limit may result in an economic hardship to many small business enterprises that currently do metal plating. These businesses may be forced to close down due to the implementation of these limits. Modesto experiences a chronic unemployment rate above 12%, and economic development is critical to this community.

Comment: The Bay Planning Coalition represents approximately 200 maritime industry, shoreline businesses, local governments and Bay users along the S.F. Bay shoreline and is most significantly affected by the proposed California Toxics Rule. One of our primary interests is the economic analysis which under the EPA's model estimates a range of annual costs of $14.9 to $86.6 million.

We believe the annual costs for implementation of the Rule statewide exceed the EPA estimate range. We are particularly concerned because it appears that the economic impact analysis did not include the costs of compliance for the NPDES stormwater permit applicants. In order for us to provide EPA with sufficient detail on our economic analysis and cost projection as well as the impact of the Rule on small business under the Regtory Flexibility Act, we request an extension of time to respond. A 30-day extension from September 26 to October 27, 1997 would be acceptable. Thank you so much for your consideration.

Comment: If you go beyond best management practices, you're impliedly eliminating those provisions of the 1995 Basin Plan. I think it would clearly violate the Regulatory Flexibility Act, since you haven't considered the costs of controls.

If, again, our dischargers had to do whatever it took, our members had to do whatever it took -- and in fact, several of our dischargers are small entities under the Regulatory Flexibility Act: the City of

Emeryville, the City of Albany, the City of Piedmont.

The NPDES permits small entities and municipalities under 50,000 in number. If they had to do whatever it took to provide the waste allocations without consideration of the economic impact, those entities, because of the practical problems of needing 50 coliseums of storage in the Bay Area and the practical considerations that plague us -- and the only place you could put that is by the bay, where you have a serious problem with requirements under the Endangered Species Act.

To the extent you're standing in the shoes of the state in promulgating these standards, you violate the cost/benefit balances provision of the Porter Cologne Act.

Response to: CTRH-001-005b

With respect to EPA's compliance with the RFA see response to CTR-001-008b. With respect to stormwater costs see response to CTR-013--003 and CTR-04-004 (Category J; Stormwater Economics). With respect to commenters' assertion that EPA violated the cost/benefit provision of the Porter-Cologne Act, see response to CTR-020-002 (Category C-21; Legal Issues).

Comment: Looking at the results of our monitoring and your criteria, we'll have to achieve another 70 to 90 percent reduction in pollutants in order to be in compliance. That means we'd have to increase our storage volume to 20,000 acre feet just to handle average annual runoff we have underway right now.

That's a price tag of $220 million to $400 million to try to stay in compliance with the current criteria if you interpret the rule to apply to us -- 220 million. And then we can't prevent major storm events in our community, storm impacts that cause a discharge, in which case 100 percent of the discharges would exceed -- would be out of compliance, even though we were retaining 100 percent of the average annual rainfall.

We think that raises a problem with the Regulatory Flexibility Act, both in terms of the cost analysis itself and the impact that accrues to small communities, certainly with respect to the executive order. Just in our case alone the $100 million limit is in serious trouble, dealing with compliance with a five-year schedule just in our community with the possibility of $80 million per year of expense. That does not include O & M cost in that system.

Comment: 5. The proposed rule is inconsistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. The Clean Water Act requires that water quality standards be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and also taking into consideration their use and value for navigation (See CWA section 303(c)(2)(A)). Consistent with this, EPA regulations require that water quality standards be based on identification of where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern. For those identified waters, states must adopt criteria for such toxic pollutants applicable to sufficient to protect the designated use"(See 40 CFR 131.1 1 (a)(2)).

Clearly the intent of both the Act and EPA regulations is that water quality standards be tailored to the characteristics of the waters in question. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider regulatory alternatives, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. In failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act.

Response to: CTR-005-006b

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b (Subject R, Regulatory Flexibility Act), CTR-036-005c (Category E-01c; Executive Order 12866), CTR-036-003a, and the preamble to the proposed rule.

Comment: UNFUNDED MANDATED PROGRAMS

One of the express purposes of the Unfunded Mandates Reform Act of 1995 is "to end the imposition, in the absence of full consideration of Congress of Federal mandates on State, local and tribal governments without adequate Federal funding, in a manner that may displace other essential State, local and tribal governmental priorities." 2 U.S.C. section 1501(2). The proposed rule in its current form seems to have been drafted without regard to its fiscal impact on cities. The rule could require treatment of storm water discharges, despite the fact that no funding mechanism, nor any assistance, financial or otherwise, is being provided to the cities by either USEPA or the State of California. If the USEPA wishes to impose these treatment programs, it needs to provide funds to pay for their implementation.

We believe that USEPA's analysis under the Unfunded Mandates Reform Act of 1995 that the CTR will not result in an expenditure in the aggregate of more than $100,000,000.00 a year is wrong. As pointed by other local government entities which have submitted comments, the USEPA appears to assume that a BMP program will lead to compliance with numeric effluent guidelines and that there will be no associated additional costs for the BMP program. However, the economic analysis does not appear to analyze the potential cost of end of pipe treatment controls and analyze in any sort of detail what sort of BMP's would be necessary to achieve numeric effluent guidelines for the toxic pollutants. The economic analysis itself acknowledges that under its existing NPDES stormwater permit, the cities and counties of the Los Angeles area plan to spend $15,000,000 annually on public education in a program to curb illegal dumping. That cost estimate was based upon the analysis by the SWRCB of the 1990 permit. The actual costs of implementing all of the programs under the 1990 permit have been considerably more. For example, the cost estimates prepared by the San Gabriel Valley COG in connection with the LA. County permit, estimated implementation costs at $8.98 per person per year. The City of Long Beach estimated that it was already spending, as of early 1996, $12.4 million a year and that the estimated costs of implementing the programs under the current permit adopted in July 1996 would be another $3.4 million or about $16.1 million total. That number extrapolated to approximately $38.35 per person per year. The comparative cost numbers prepared by the Santa Monica Bay Restoration Project in connection with the existing Los Angeles permit estimated an average cost of dedicated stormwater program funding of $3.34 a month per household or approximately $13.36 per person per year. Using that number as a base, a city with a population of approximately $40,000 people can expect to spend $500,000 a year under its current stormwater programs. Extrapolating those numbers over the State of California, it is quite clear that the costs of implementing the existing stormwater program are in the hundred of millions of dollars a year.

Considering these economic analyses, it is quite clear that the financial impact of requiring end of pipe treatment controls or other means to achieve numeric effluent guidelines would quite easily exceed $100 million a year.

The foregoing numbers, of course, do not include potential increased costs to residents, business and industry complying with the discharge prohibitions and other requirements under the "City's current municipal permits nor does the EPA's economic analysis calculate the potential costs to regulated dischargers, that is, business and industries required to either obtain an individual NPDES stormwater permit or who are covered under a general permit by filing a notice of intent.

Necessarily, the expenditure of such large amounts of money is an important public policy question, particularly in a situation where neither the State of California nor the federal government has been

willing to provide any meaningful source of funds to local agencies to carry out these programs.

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and wtih an expectation that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit wand with the same expectation, Sunnyvale would like to make the following points on its own behalf:

2. Obligation to Assess Alternative Cancer Risk Levels for Human Health-Based Criteria. Sunnyvale is gravely concerned that EPA has used the wrong approach in proposing to establish human health criteria for organic pollutants, particularly those pollutants for which the proposed criteria are below the method level of detection ("MDL"). Sunnyvale recommends that EPA should thoroughly assess all of the potential impacts, including costs and benefits, of the 10E-4 and 10E-5 risk levels before proposing the human health-based criteria. As pointed out in the EOA Letter, there is a significant potential for advancing technology to lower the MDL for many pollutants to the point where laboratory equipment is able to measure some or all of the organic compounds for which EPA is proposing to establish criteria at the new level. It is intuitively obvious that the costs of attaining criteria set at the 10E-6 level will be significantly greater than attainment of a 10E-5 or 10E-4 level, particularly where, as pointed out in the EOA Letter, the only available method of treatment is granular activated carbon. Sunnyvale is concerned that the EA does not adequately address the potential for these costs, and, consequently, does not take these potential costs into account in determining whether to exercise its flexibility in choosing whether to use a 10-4 , 10-5 or 10-6 cancer risk level as the basis for its CTR promulgation.

EPA is required by Executive Order 12866, the Regulatory Flexibility Act and the Unfunded Mandates Reform Act to identify and analyze alternatives to a proposed rule. We cannot understand, therefore, why EPA has done such a cursory analysis in the preamble to the CTR and the EA of the alternatives to the use of the most stringent (10E-6) risk level for establishing criteria for human health effects of pollutants, particularly organic pollutants. EPA cannot base its selection of the 10E-6 level based upon previous regulatory pronouncements by the State of California. Any new determination by the State will be subject to the analytical requirements of Section 13241 of the Porter-Cologne Act and by review by the Office of Administrative Law. Thus, it is not a foregone conclusion that the State will ultimately select the 10E-6 level. EPA has its own legal requirements to fulfill. Accordingly, we ask that EPA not

promulgate the final human health criteria for the pollutants of concern unless and until it has adequately analyzed the costs and other implications of the various alternatives to the 10E-6 level.

In conclusion, we are entirely supportive of many of EPA's innovative approaches towards development of the CTR, particularly as regards the toxic metals. Hwoever, we believe that EPA has needlessly failed to comply with many of its legal obligations, particularly as regards the development of human health-based criteria on cancer risk levels of organic pollutants. We urge the Agency to reconsider its position in the matters covered by this letter (as amplified by the EOA Letter) and the CASA/Tri-TAC letter. Sunnyvale pledges its continued participation in place-based watershed management planning in the South Bay, its cooperation with the Agency in making a success of the WPI, and to an ongoing effort by the Agency and others to reach water quality goals in the South Bay. We thank you for the opportunity to comment on the proposed CTR.

Response to: CTR-021-005e

Comment: It is with a sense of reluctance that Sunnyvale joins in CASA/Tri-TAC's adverse comments on the CTR and the EA, and Sunnyvale does so in a spirit of constructive criticism and with an expectation that the Agency will make the necessary adjustments in its approach towards the CTR before the final rule is promulgated. In addition, in the same spirit and with the same expectation, Sunnyvale would like to make the following points on its own behalf:

3. Failure to Address Important Stormwater-Related Issues. In addition to its POTW, Sunnyvale is the owner of a system of storm drains which contribute wet weather flows to the South Bay. We are concerned that the EA entirely neglects the potential impacts of the proposed CTR on the storm drains. The EA entirely omits any meaningful analysis ofthe costs of bringing storm drains into compliance with the proposed CTR, thereby significantly understating the overall costs of the CTR. We believe that this omission is violative of the Agency's legal obligations under the authorities cited in the preceding

paragraph.

In addition, we join in the comments being filed by the various other operators of stormwater collection systems to the effect that EPA has overstated the legal requirements for storm drains to comply with numerical criteria.

Response to: CTR-021-006d

For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b (Category R, RFA), CTR-036-005c (Category E-01c; Executive Order 12866), CTR-036-003a, and the preamble to the proposed rule.

EPA believes it properly described the potential impact of the implementation of the CTR on storm drains in the preamble to the proposed CTR and in its Economic Analysis. For further discussion see responses to CTR-013-003 and CTR-040-004 (Category J; Stormwater Economics).

Comment: LEGAL ISSUES - Executive Order 12866, Unfunded Mandates Reform Act, Regulatory Flexibility Act

* SCAP believes that EPA has failed in its duties under the Unfunded Mandates Reform Act to consider the cost of the proposed regulation to local governments and the regulated community and to select the most cost-effective and least burdensome regulatory alternative that achieves the objectives of the rule and is consistent with statutory requirements. Although EPA prepared an assessment of the anticipated costs and benefits of the CTR, we believe that the economic analysis failed to consider major factors contributing to potential costs and substantially overstated the anticipated benefits of the rule (see below).

Comment: p. 42191 -- The Unfunded Mandates Reform Act of 1995 All local governmental agencies, especially "small agencies" within the meaning of the Unfunded Mandates Reform Act (2 U.S.C.A. 1511 et. seq.) deserve the protections afforded by that Act. EPA's claim that the Act does not apply because "Today's proposed rule does not regulate or affect any entity" is unfounded. The claim is that the CTR may not impose costs greater than $100 million a year is without merit (see discussion below). The CTR directly impacts all NPDES holders in the State of California, as stated above. Accordingly, all of its provisions apply to the CTR, including, without limitation, the requirement found in Section 1533(a)(2) that the Agency's required small government agency plan provide for "meaningful and timely input" into the development of the CTR. As stated earlier, the failure of EPA to allow CASA/Tri-TAC members the opportunity to review the State Proposal for any longer than two weeks simply does not meet a common sense interpretation of "meaningful and timely review." EPA must comply with the Act.

Comment: EPA also has failed to meet its obligations under the Unfunded Mandates Reform Act of 1995 (the "Reform Act"). As with E.O. 12866, the Reform Act requires federal agencies to assess the effects of their regulatory actions on state, local and tribal governments, and on the private sector [U.S.C. section 1531]. Among other things, the Reform Act requires the preparation of a cost-benefit analysis and the examination of a range of alternatives, whenever the proposed action may result in expenditures in excess of $100 million [2 U.S.C. section 1532, 1535]. In addition, the Reform Act contains a number of specific requirements where an action may significantly or uniquely impact small governments [2 U.S.C. section 1533].

EPA asserts again that it does not have to comply with the Reform Act because the proposed rule "imposes no direct enforceable duties on the State or any local government or on the private sector." [62 Fed. Reg 42160, 42191]. For the reasons discussed earlier, this assertion is without merit. As EPA acknowledges, these criteria will serve as the basis for any water quality standards promulgated by the State, which in turn will be binding on. local government and private industry. Unless EPA is prepared

to view these criteria as being optional, it therefore cannot in good conscience state that they do not create an enforceable duty. Given this, EPA must comply with the mandates of the Reform Act

Response to: CTR-036-003a

EPA has determined that the CTR contains no federal mandates (under the regulatory provisions of title II of the Unfunded Mandates Reform Act) for State, local, and tribal governments or the private sector. The CTR imposes no direct enforceable duties on the State or any local government or on the private sector; rather, the CTR promulgates ambient water quality criteria which, when combined with State-adopted uses, will create water quality standards for those water bodies with adopted uses. The State will then use these resulting water quality standards in implementing its existing water quality control programs.

EPA recognizes that it has undertaken an economic analysis pursuant to E.O. 12866 for this rule. This analysis, however, makes numerous assumptions and does not necessarily predict how the state will implement the criteria. Thus, the economic analysis represents EPA's best estimate of the implementation costs of the rule. In any event, even if EPA were to consider the implementation costs rather than the direct costs of the rule for the purposes of UMRA compliance, EPA has determined that this rule will not result in expenditures of $100 million or more for State, local, or tribal governments, in the aggregate, or the private sector in any one year.

Comment: A further consequence of the flawed economic analysis is the conclusion that the CTR is not a major rule (i.e., one which will result in excess of $100 million per year expenditure) subject to Presidential Executive order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Reform Act. The District, for example, is a small community having a population of under 50,000 and, in addition, serves several small towns and communities (Sonoma, Glen Ellen, Boyes Hot Springs and Agua Caliente) that would be greatly impacted by the proposed rule.

Comment: 5. The proposed rule is inconsistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. The Clean Water Act requires that water quality standards be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, and recreational purposes (see CWA section 303(c)(2)(A)). Consistent with this, EPA regulations require that water quality standards be based on identification of "specific water bodies where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern..." For those identified waters, "states must adopt criteria for such toxic pollutants applicable to the water body sufficient to protect the designated use" (See 40 CFR 131.11(a)(2)). Clearly the intent of both the Clean Water Act and EPA regulations is that water quality standards be tailored to the characteristics of the waters in question. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider regulatory alternatives, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. Moreover, in failing to properly consider the impacts on small entities, such as the District and the small communities it serves, the rule is inconsistent with the Regulatory Flexibility Act.

Response to: CTR-038-006d

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b (Category R; RFA), CTR-021-005c (Category E-01c; Executive Order 12866), CTR-036-003a, and the preamble to the proposed rule.

Comment: 7. Separate, sites-specific aquatic life criteria for copper and human health criteria for mercury should be adopted for Schell Slough, or alternatively EPA should specify implementation procedures for these criteria that will preclude unreasonable controls such as end-of-pipe treatment. To comply with the Clean Water Act and EPA regulations, EPA should consider specific water bodies. To

fulfill the spirit of Presidential Executive Order 12866 and the requirements of the Unfunded Mandates Reform Act and the Regulatory Flexibility Act, EPA should evaluate regulatory alternatives based on an analysis of costs and benefits. Based on the assessment of costs and benefits described in "3" above, EPA should either adopt the criteria that is currently achieved, or alternatively specify implementation procedures that would allow the current discharge to continue (e.g., allowable Mixing zones and averaging periods and, for copper, a translator and water-effect ratio). Again, the District is amenable to continuing to address these constituents through pollution prevention measures and to assessing the actual impacts of these constituents in Schell Slough. Without EPA specifying such implementation procedures in the CTR, it is possible that the CTR could impose significant costs on the District (and the other small communities its serves) without providing a commensurate environmental benefit. In that case, the CTR would be inconsistent with the Clean Water Act, EPA regulations, Presidential Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act.

Response to: CTR-038-008d

See response to CTR-038-008a (Category C-24; Site-Specific Criteria). See response to CTR-034-010b and CTR-060-010 (Category C-28; Detection Limits). Comment: 8. EPA should not adopt criteria for any pollutant where the method detection limit exceeds the objective and there is insufficient detectable, reliable data to determine if the pollutant could reasonably be expected to interfere with designated uses. The proposed rule includes criteria for a number of constituents where there is insufficient data to determine whether the discharge of such pollutants could reasonably be expected to interfere with the designated uses. EPA has chosen to promulgate criteria for these constituents even though section 303 (c)(2)(B) of the Clean Water Act requires States to adopt numeric criteria only for constituents "...the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses." Clearly, this "play-it-safe" approach goes beyond the requirements of the Clean Water Act and is therefore unnecessary. By taking this approach, however, EPA is unable to fulfill its duty (under Presidential Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act) to assess the costs, benefits, and impacts of the rule on local government and small entities. While this may be the conservative approach for EPA, it places dischargers throughout the State at risk. As analytical detection limits improve, dischargers may find they are unable to achieve the criteria without costly end-of-pipe controls. But, by then, it will be too late for EPA to evaluate the costs and benefits of the criteria and alternative criteria. For these reasons, EPA

must not adopt criteria for those constituents. If EPA does adopt criteria for those constituents, EPA must evaluate the costs and benefits of the criteria, as well as alternative criteria, using worst case assumptions (i.e., assume that discharge levels and ambient levels are at the detection limits). With respect to the District's discharge and Schell Slough and Second Napa Slough, the criteria in this category include, but are not necessarily limited to, the following : benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoroanthene, benzo(k)fluoroanthene, chrysene, dibenzo(a,h)anthracene, aldrin, 4,4'-DDD, 4,4'-DDE, dieldrin, endosulfan I, endosulfan II, endosulfan sulfate, heptachlor, heptachlor epoxide, toxaphene, PCB-1016, OCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, PCB-1260, and hexachlorobenzene (see Table 3).

Response to: CTR-038-009d

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

II. Concern: The economic analysis upon which the Rule is based is seriously flawed.

* A consequence of the cost/benefit analysis of the Rule are several erroneous conclusions, namely that: (1) this is not a "significant regulatory action" or a major rule (i.e., one which will result in excess of $100 million annual expenditure) subject to the requirements contained in Presidential Executive Order 12866 and the Unfunded Mandates Reform Act; and (2) this is not a rule that will have a significant economic impact on a substantial number of small entities protected under the Regulatory Flexibility Act.

Comment: MAJOR CONCERNS

We do, however, have fundamental concerns with the Rule as it is presently proposed and its supporting economic analysis. We believe the Rule can be modified in a manner that will be responsive to our concerns while at the same time being consistent with applicable Federal law and regulations. Our major concerns are presented here and are followed by our recommended modifications.

III. Concern: The proposed Rule violates applicable Federal law and regulations

* In failing to properly evaluate the Rule's impacts and in failing to adequately consider regulatory alternatives, the Rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act (See Attachment B).

Response to: CTR-040-012b

See responses to CTR-021-005c (Category E-01c; Executive Order 12866), CTR-036-003a, and the preamble to the proposed rule.

Comment: RECOMMENDED MODIFICATIONS

To address our concerns, we recommend the following modifications which do not undermine the toxic pollutant control actions envisioned in EPA's economic analysis (e.g., BMPs for stormwater and source

control). In fact, some of these recommendations would provide incentives for greater movement toward achieving the water quality criteria than would occur under the Rule as it is currently proposed.

II. Recommendation: Adopt human health criteria for PAHs at a 10 (-4) risk level and human health criteria for other carcinogens at risk levels that are generally achieved by municipal wastewater and stormwater dischargers.

* As previously stated, the Sacramento Stormwater Management Program would have to expend on the order of $260 million per year to treat stormwater, and this may not achieve the proposed criteria for PAHS, which is based on a 10 (-6) cancer risk level.

* Under the Unfunded Mandates Reform Act, EPA must adopt the least cost alternative for complying with the CWA, unless the Administrator explains in the final rule why the least cost alternative is not adopted. As indicated in the Preamble, risk levels of 10 (-5) and 10 (-4) are acceptable under the CWA.

* Therefore, pursuant to the spirit of the Unfunded Mandates Reform Act, EPA should adopt the PAH criteria at a 10 (-4) risk level. The same should be true for other carcinogens that present attainability problems for dischargers. Most carcinogenic constituents are not readily controllable through source control or BMPs and would generally require end-of-pipe controls to achieve significant reduction. The benefits associated with additional reduction of carcinogenic constituents are not expected to be measurable since, as acknowledged in the economic analysis,point sources are relatively minor sources of these constituents.

Comment: b. Unfunded Mandates Reform Act

Under the Unfunded Mandates Reform Act (UMRA, 2 U.S.C. section 1501 et seq.), EPA is required to consider the cost of a proposed regulation to both state and local Governments and the regulated community. EPA is required to prepare a qualitative and quantitative assessment of the anticipated costs and benefits of the Federal mandate and to select the most cost-effective and least burdensome regulatory alternative that achieves the objectives of the rule and is consistent with statutory requirements. EPA has performed an economic analysis, however, EPA contends that the cost of the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year" necessary to trigger the other

requirements of the UMRA.

EPA only makes a limited analysis of alternatives and does not explicitly defend the rule's cost-effectiveness because it contends that does not apply because the $100 million cut off was not met (*3). Based on the cost research performed by the POTWs and other dischargers, EPA's contention that UMRA's requirements do not apply may be challengeable. The regulated community may also be able to demonstrate that the Administrator was abitrary and capricious by alleging the cost of implementing the CTR will not result i expenditures in the aggregate" of $100 million or more in any one year."

EPA should have considered alternatives, such as the adoption of less stringent criteria or different risk levels (e.g., 10E-4 or 10E-5), that could also achieve the objectives of the rule. These alternatives would have met both the UMRA criteria of being more cost-effective and less burdensome while still maintaining consistency with the Clean Water Act.

(*3) "EPA has determined that this rule does not contain a federal mandate that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. The proposed rule imposes no direct enforceable duties on the State or any local government or on the private sector; rather, this rule proposes ambient water quality criteria which, when combined with State adopted designated uses, will create water quality standards for those water bodies with adopted uses. The State may use these resulting water quality standards in implementing its existing water quality control programs. Today's proposed rule does not directly regulate or affect any entity and, therefore, is not subject to the requirement of sections 202 and 205 of the UMRA." 62 Fed. Reg. 41,191.

Comment: 8. The proposed Rule is Inconsistent with Applicable Federal Law and Regulations

The proposed rule is inconsistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. (See attached Legal Analysis of the Proposed California Toxics Rule) to properly evaluate the rule's economic impacts and in failing to adequately consider alternative criteria for San Francisco Bay Area waters, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act (Id). In failing to properly consider the impacts on small entities, the

rule is inconsistent with the Regulatory Flexibility Act (Id).

Thank you for the opportunity to provide comments on this important new rule. Please call if you have any questions regarding our letter.

Response to: CTR-041-013c

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). For a discussion of how the rule complies with the E.O. 12866, the Unfunded Mandates Reform Act, and Regulatory Flexibility Act, see responses to CTR-001-008b (Category R; UMRA), CTR-021-005c (Category E-01c; Executive Order 12866), CTR-036-003a, and the preamble to the proposed rule.

Comment: b. Unfunded Mandates Reform Act

Under the Unfunded Mandates Reform Act (UMRA, 2 U.S.C. section 1501 et seq.), EPA is required to consider the cost of a proposed regulation to both state and local Governments and the regulated community. EPA is required to prepare a qualitative and quantitative assessment of the anticipated costs and benefits of the Federal mandate and to select the most cost-effective and least burdensome regulatory alternative that achieves the objectives of the rule and is consistent with statutory requirements. EPA has performed an economic analysis, however, EPA contends that the cost of the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year" necessary to trigger the other requirements of the UMRA.

EPA only makes a limited analysis of alternatives and does not explicitly defend the rule's cost-effectiveness because it contends that UMRA does not apply because the $100 million cut off was not met.(*4) Based on the cost research performed by the POTWs and other dischargers, EPA's contention that UMRA's requirements do not apply may be challengeable. Specifically, the EPA Administrator's determination that the cost of implementing the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year" could be found to be arbitrary and capricious.

EPA should have considered alternatives, such as the adoption of less stringent criteria or different risk levels (e.g., 10E-4 or 10E-5), that could also achieve the objectives of the rule. These alternatives would have met both the UMRA criteria of being more cost-effective and less burdensome while still maintaining consistency with the Clean Water Act.

(*4) "EPA has determined that this rule does not contain a federal mandate that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. The proposed rule imposes no direct enforceable duties on the State or any local government or on the private sector; rather, this rule proposes ambient water quality criteria which, when combined with State adopted designated uses, will create water quality standards for those water bodies with adopted uses. The State may use these resulting water quality standards in implementing its existing water quality control programs. Today's proposed rule does not directly regulate or affect any entity and, therefore, is not subject to the requirement of sections 202 and 205 of the UMRA." 62 Fed. Reg. 42,191.

Comment: 7. The CTR may violate the Administrative Procedures Act, the and Executive Order (E.O.) Unfunded Mandates Reform Act No. 12866.

In the Preamble to the CTR, EPA repeatedly claims that the CTR will not result in expenditures of more than $100 million per year and, therefore, the statutory requirements of the UMRA and E.O. 12866 are not triggered.(*1) Caltrans' annual costs alone and only in Los Angeles will exceed the $100 million annual figure, even assuming the lowest level of treatment. Therefore, EPA's cost assumptions are challengeable as being arbitrary and capricious and in violation of the Administrative Procedures Act.(*2)

Request: Caltrans requests that EPA reconsider its cost estimates based on the comments received during the public comment period.

Caltrans would like to thank EPA for the opportunity to provide comments on this proposed regulation. It is hoped that EPA will consider and address Caltrans' comments in the final version of the CTR. Should you have any questions concerning our comments on the CTR, please feel free to address these questions to Marcia Arrant at (916) 657-5381.

(*1) See CTR, 62 Fed. Reg. at 42,188, and at 42,191 ("EPA has determined that this rule does not contain a federal mandate that may result in expenditures by State, local and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year.")

(*2) See American Iron and Steel Institute v. EPA, 1997 WL 297251 (D.C. Cir., 1497)(the court found that EPA had arbitrarily failed to adequately address cost-justification for its elimination of mixing zones. EPA had estimated the total cost of elimination mixing zones for bioaccumulative chemicals of concern (BCCS) from all dischargers to the Great Lakes at $200,000, without even acknowledging a comment estimating the cost to one town for removal of mercury from its sewage discharge would be approximately $300,000).

Comment: 5. The proposed rule is inconsistent with applicable Federal law and regulations.

In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. The Clean Water Act requires that water quality standards be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes (see CWA section 303(c)(2)(A)). Consistent with this, EPA regulations require that water quality standards be based on identification of "specific water bodies where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern..." For those identified waters,"states must adopt criteria for such toxic pollutants applicable to the water body sufficient to protect the designated use"(See 40 CFR 131.1 I (a)(2)). Clearly the intent of both the Act and EPA regulations is that water quality standards be tailored to the characteristics of the waters in question. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider regulatory alternatives, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. Moreover, in failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act.

Response to: CTR-043-005d

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). Comment: We have reviewed the proposed CTR and offer the following comments:

4. EPA's Economic Analysis is seriously flawed. The major flaws include:

(1) failing to do an appropriate sampling of small dischargers having little or no dilution; (2) assuming in the high-end cost scenario that a 25% reduction could be achieved through source control and an additional 25% achieved through treatment plant optimization without capital improvements; (3) constraining estimates of potential costs through key assumptions, including the assumption that regulatory relief from the rule would be granted if costs were in excess of certain thresholds; and (4) exaggerating estimates of potential benefits by assuming an end (i.e., achievement of the proposed water quality criteria) that will not result from the rule. Additional concerns with the economic analysis are presented in Exhibit F. The result of these flaws is that potential costs are greatly understated and potential benefits are greatly overstated. Moreover, the flawed economic analysis has lead to the erroneous conclusion that the CTR is not a "significant regulatory action" or major rule subject to Presidential Executive Order 12866 and the Unfunded Mandates Reform Act or a rule that affects small entities protected under the Regulatory Flexibility Act. The City, for example, is a small community having a population of under 50,000 and would be greatly impacted by the proposed rule.

Comment: We have reviewed the proposed CTR and offer the following comments:

8. EPA should not adopt criteria for any pollutant where the method detection limit exceeds the objective and there is insufficient detectable, reliable data to determine if the pollutant could reasonably be expected to interfere with designated uses. The proposed rule includes criteria for a number of constituents where there is insufficient data to determine whether the discharge of such pollutants could reasonably be expected to interfere with the designated uses. EPA has chosen to promulgate criteria for these constituents even though section 303 (c)(2)(B) of the Clean Water Act requires States to adopt

numeric criteria only for constituents "... the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses." Clearly, this approach goes beyond the requirements of the Clean Water Act and is therefore unnecessary. Additionally, this approach does not allow EPA to fulfill its duty (under Presidential Order 12866, the Unfunded Mandates Reform Act, and the Regulatory Flexibility Act) to assess the costs, benefits, and impacts of the rule on local government and small entities. While this may be the conservative approach for EPA, it places dischargers throughout the State at risk. As analytical detection limits improve, dischargers may find they are unable to achieve the criteria without costly end-of-pipe controls. But, by then, it will be too late for EPA to evaluate the costs and benefits of the criteria-and-consider alternative criteria. For these reasons, EPA should not adopt criteria for those constituents. If EPA does adopt criteria for those constituents, EPA should evaluate the costs and benefits of toxic criteria, as well as alternative criteria, using worst case assumptions (i.e., assume that discharge levels and ambient levels are at the detection limits).

Response to: CTR-044-009d

See responses to CTR-034-010b and CTR-060-010 (Category C-28; Detection Limits). Comment: b. Unfunded Mandates Reform Act

Under the Unfunded Mandates Reform Act (UMRA, 2 U.S.C. section 1501 et seq.), EPA is required to consider the cost of a proposed regulation to both state and local Governments and the regulated community. EPA is required to prepare a qualitative and quantitative assessment of theanticipated costs and benefits of the Federal mandate and to select the most cost-effective and least burdensome regulatory alternative that achieves the objectives of the rule and is consistent with statutory requirements. EPA has performed an economic analysis, however, EPA contends that the cost of the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year" necessary to trigger the other requirements of the UMRA.

EPA only makes a limited analysis of alternatives and does not explicitly defend the rule's cost-effectiveness because it contends that does not apply because the $100 million cut off was not met.(*3) Based on the cost research performed by the POTWs and other dischargers, EPA's contention that UMRA's requirements do not apply may be challengeable. The regulated community may also be able to demonstrate that the Administrator was arbitrary and capricious by alleging the cost of

implementing the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year."

EPA should have considered alternatives, such as the adoption of less stringent criteria or different risk levels (e. g., 10E-4 or 10E-5), that could also achieve the objectives of the rule. These alternatives would have met both the UMRA criteria of being more cost-effective and less burdensome while still maintaining consistency with the Clean Water Act.

(*3) "EPA has determined that this rule does not contain a federal mandate that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. The proposed rule imposes no direct enforceable duties on the State or any local government or on the private sector; rather, this rule proposes ambient water quality criteria which, when combined with State adopted designated uses, will create water quality standards for those water bodies with adopted uses. The State may use these resulting water quality standards in implementing its existing water quality control programs. Today's proposed rule does not directly regulate or affect any entity and, therefore, is not subject to the requirement of sections 202 and 205 of the UMRA." 62 Fed. Reg. 42,191.

Comment: IV. EPA Has Not Complied With Applicable Regulatory Review Requirements. There are several significant statutes and executive orders that require EPA to undertake analyses of the costs and benefits of its regulations, and to submit the regulations and analyses to other governmental bodies, including the Office of Management and Budget (OMB) and Congress. Those authorities include the Regulatory Flexibility Act, the Small Business Regulatory Enforcement and Fairness Act (SBREFA), the Unfunded Mandates Reform Act, the Congressional Review Act, and Executive Order 12866 (Regulatory Planning and Review). EPA apparently believes that it does not need to comply with any of those requirements for this rulemaking. (62 Fed. Reg. at 42188-42191). API believes that EPA is required to meet those obligations for the proposed criteria, and that the Agency's rationale for avoiding this responsibility has no legal basis.

EPA supports its decision not to comply with the regulatory review statutes by stating that the proposed criteria "by themselves, do not directly impose economic impacts." (62 Fed. Reg. at 42188). EPA admits that when those criteria are combined with the designated uses that have been adopted by the State, and implemented in permit limits, "there may be a cost to some dischargers." (62 Fed. Reg. at 42188) could be substantial; the Agency itself estimates that the compliance cost could be between $15 and $87 million per year.(62 Fed. Reg. at 42189). (That does not include indirect costs to the economy, which would surely put this rule above the $100 million impact threshold specified in several of the regulatory review statutes listed above.) EPA cannot ignore those costs by creating its own interpretation of those statutes in which only "direct" impacts need be considered. There is no support in the statutory language or legislative history for such a reading, and EPA has cited no such support in its Federal Register notice.

There is another problem with EPA's rationale for avoiding regulatory review: if EPA were right that "indirect" impacts do not trigger those reviews, the impacts of this rulemaking are not really "indirect." Those impacts emerge clearly once the proposed criteria are combined with the State's designated uses. Those designations have already been established, so there is nothing uncertain or indefinite about that aspect of the water quality standards. Then, once the standards are completed, the State must implement those standards through permit limits. While there are some decisions that the State must make in determining the proper permit limits, which can influence the size of the compliance costs, EPA can readily determine a range of possible costs. In fact, the Agency has already done so, resulting in the $15 - $87 million cost range discussed above. While those costs may not be fixed with certainty, they are certainly "direct economic impacts". Therefore, even if the Agency were correct in looking at only "direct" impacts, this rulemaking poses such impacts, and EPA must comply with the statutory requirements to conduct and submit cost and benefit analyses of its proposed criteria.

V. CONCLUSION

As explained above, EPA's proposal to issue water quality criteria for toxicities in the State of California suffers from serious legal flaws. API urges the Agency to reconsider its intended course of action in light of the issues raised in these and other public comments. If you have any questions regarding these comments, or would like any additional information, please call Theresa Pugh at 202/682-8036.

Comment: C. RECOMMENDATIONS FOR MODIFICATIONS TO THE CTR AND EA

EPA should revise the proposed rule and economics analysis such that they are consistent with applicable Federal law and regulations. In proposing a single set of criteria for all estuaries, the rule is inconsistent with the Clean Water Act and EPA's water quality standards regulations. In failing to properly evaluate the rule's economic impacts and in failing to adequately consider alternative criteria for San Francisco Bay Area waters, the rule is inconsistent with Presidential Executive Order 12866 and the Unfunded Mandates Reform Act. In failing to properly consider the impacts on small entities, the rule is inconsistent with the Regulatory Flexibility Act. Specific citations for these inconsistencies are contained in comments from BADA and CASA/Tri-TAC.

Response to: CTR-052-021d

With respect to EPA's decision to publish a single set of criteria in the rule, see responses to CTR-035-012a and CTR-036-005 (both responses are in Category C-21; Legal issues). Comment: Separate, scientifically defensible, reasonably achievable aquatic life criteria for copper should be adopted for San Francisco Bay, or alternatively EPA should specify in the Preamble implementation policies for copper that will result in reasonable control measures actions. To comply with the Clean Water Act and EPA regulations, EPA is required to consider specific water bodies. To fulfill the spirit of Presidential Executive Order 12866 and the requirements of the Unfunded Mandates Reform Act, EPA is required to evaluate regulatory alternatives based on an analysis of costs and benefits. Based on BADA's analysis of costs and benefits, EPA should either adopt copper criteria that are reasonably achievable or alternatively specify implementation policies that will avoid costly end-of-pipe controls. Potential implementation measures that could be specified include use of the following in calculating effluent limitations: actual dilution based on modeling studies; copper translators; probability of compliance less than 99.9%; and water-effect ratios determined for different segments of the Bay. Unless EPA specifies these or similar implementation policies in the rule, it is possible that the CTR could result in significant costs ($12 million per year to $78 million per year) while resulting in minor environmental benefit (a 1% reduction in copper loading to the Bay). In that

case, the CTR would violate the Clean Water Act, EPA regulations, Presidential Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act. (see the discussion under Item 11 below.)

Comment: b. Unfunded Mandates Reform Act

Under the Unfunded Mandates Reform Act (UMRA, 2 U.S.C. section 1501 et seq.), EPA is required to consider the cost of a proposed regulation to both state and local Governments and the regulated community. EPA is required to prepare a qualitative and quantitative assessment of theanticipated costs and benefits of the Federal mandate and to select the most cost-effective and least burdensome regulatory alternative that achieves the objectives of the rule and is consistent with statutory requirements. EPA has performed an economic analysis, however, EPA contends that the cost of the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year" necessary to trigger the other requirements of the UMRA.

EPA only makes a limited analysis of alternatives and does not explicitly defend the rule's cost-effectiveness because it contends that does not apply because the $100 million cut off was not met.(*3) Based on the cost research performed by the POTWs and other dischargers, EPA's contention that UMRA's requirements do not apply may be challengeable. The regulated community may also be able to demonstrate that the Administrator was arbitrary and capricious by alleging the cost of implementing the CTR will not result in expenditures in the aggregate "of $100 million or more in any one year."

EPA should have considered alternatives, such as the adoption of less stringent criteria or different risk levels (e. g., 10E-4 or 10E-5), that could also achieve the objectives of the rule. These alternatives would have met both the UMRA criteria of being more cost-effective and less burdensome while still maintaining consistency with the Clean Water Act.

(*3) "EPA has determined that this rule does not contain a federal mandate that may result in

expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. The proposed rule imposes no direct enforceable duties on the State or any local government or on the private sector; rather, this rule proposes ambient water quality criteria which, when combined with State adopted designated uses, will create water quality standards for those water bodies with adopted uses. The State may use these resulting water quality standards in implementing its existing water quality control programs. Today's proposed rule does not directly regulate or affect any entity and, therefore, is not subject to the requirement of sections 202 and 205 of the UMRA." 62 Fed. Reg. 42,191.

Comment: EBMUD perceives there to be a significant overall economic impact resulting from CTR, contrary to the conclusions reached by EPA. Because the cost may exceed $100 million annually on the regulated community (the majority of which are publicly owned agencies), it appears that pursuant to Executive Order 12,866 and the Unfunded Mandates Reform Act, the CTR can be considered a significant regulatory action which is likely to adversely affect the economy of many regions of the State, the environment and/or local governments. EBMUD is also of the opinion that EPA failed to make a, "...reasoned determination that the benefits of the intended regulation justify its costs," and is obligated to redo the draft Economic Analysis and submit it for review by the Office of Management and Budget.

Comment: The Sanitation Districts disagree with EPA's assertions that the CTR is not a significant regulatory action under Executive Order 12866 or the Unfunded Mandates Reform Act, and that EPA is not required to comply with the Regulatory Flexibility Act because the CTR establishes no requirements applicable to small entities. We believe the potential costs for POTWs to comply with the CTR criteria would far exceed the $ 100 million threshold, based on the fact that we estimate that the potential costs for seven Sanitation Districts' facilities to comply with the CTR to be nearly $150 million per year. Clearly, many of the 304 other POTWs in the State will also incur costs, as, will other NPDES permittees, indirect dischargers, stormwater dischargers, and nonpoint sources. Thus, EPA's cost figure of $15 - $87 million per year is simply not a credible estimate. Also, it is quite clear that the CTR is likely to adversely affect local governments, including over 40 small communities located in our service area, and that it is significantly different from other federal regulations previously promulgated in California. We believe that EPA has not complied with the mandates of Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act. Accordingly, EPA must revise the economic analysis and it must be reviewed by the Office of Management and Budget and then EPA must select the most cost-effective and least burdensome regulatory alternative.

Comment: Due to the time constraints of the comment period, we have focused our review and comments primarily on those criteria that we anticipate may cause compliance issues for one or more of the Sanitation Districts' WRPs (see below). Based on our initial review of the proposed rule, the Sanitation Districts recommend that adoption of some of the criteria be deferred. As explained in the attached comments, we believe that there are significant scientific issues regarding the human health criteria for several trihalomethanes that call into question the accuracy and appropriateness of the proposed criteria. In addition, we reconunend that EPA defer adoption of those criteria that are below detection limits and that have not been demonstrated to be adversely affecting water quality or the attaimnent of designated uses on a water body-specific basis in California. In addition, we recommend that EPA not adopt criteria for effluent dependent waters, unless they have been adjusted to reflect the characteristics of this type of

water body.

Criteria Below Detection Limits

We believe that there are fundamental problems with EPA's decision to adopt criteria that are below detection limits. This issue relates to EPA's statutory and regulatory obligations in establishing water quality criteria; namely, that EPA is subject to the same policies, procedures, analyses, and public participation requirements as States pursuant to 40 CFR section 131. These regulations require States to "review water quality data and information on discharges to specific water bodies where toxic pollutants may be adversely affecting water quality or the attainment of the designated water use or where the levels of toxic pollutants are at a level to warrant concern and must adopt criteria for such toxic pollutants applicable to the water body sufficient to protect the designated use." (40 CFR section 131.11) For criteria where the method detection limit exceeds the objective, there are inadequate data to determine if the pollutant could reasonably be expected to interfere with attainment of designated uses. We believe that because of the inability to detect these substances and the lack of monitoring information indicating water quality use impairment EPA has not been able to fulfill its obligations to conduct a water body-specific analysis of the need to promulgate criteria.(*1)

(*1)U.S. Environmental Protection Agency, Economic Analysis of the Proposed California Water Quality Toxics Rule, Office of Water (EPA-820-B-96-001, July 1997), p. 8-18.

Second, EPA has not fulfilled its obligations under the Unfunded Mandates Reform Act and Executive Order 12866 to analyze the costs and benefits of promulgating proposed criteria which cannot be detected or for which insufficient monitoring data are available.

Given these deficiencies, we recommend that EPA defer the adoption of criteria for constituents which are below detection limits until such time as EPA has demonstrated that the levels of toxic pollutants being discharged are at a level to warrant concern. As an alternative, EPA could defer to the State for promulgation of criteria for such compounds on a water body-specific basis as part of the State's continuous water quality planning process.

Response to: CTR-059-006c

See responses to CTR-034-010b and CTR-060-010 (Category C-28; Detection Limits). Comment: ISSUES OF CONCERN

The Unfunded Mandates Act of 1995, 62 FR 42191. The City of Redding disagrees with the conclusion that the proposed rule does not result in expenditures by state or local governments in aggregate of $100 million or more in any one year. The strict water quality criteria in the proposed rule would directly cause the state to adopt more stringent standards for dischargers, which would then require the local dischargers to implement exorbitant and costly measures against our users.

Regarding unfunded mandates, the City of Redding believes that the state and local governments would have no alternative in implementing this federal rule than to enforce exorbitant and costly measures against our users. Therefore, the proposed rule would directly cause significant burden and costs to state and local governments.

Comment: The PUC is aware that the Clean Water Act does not require and in fact does not allow for economic considerations in meeting water quality requirements. However, other policies and regulatory mandates (Executive Order 12866 and the Unfunded Mandates Reform Act) require that we disclose to the public the cost of meeting water quality requirements. There is no doubt that there will be costs that California must bear to produce water quality. We must assure the public that the costs will produce benefits. We are not confident that this proposed rule can do that.

Comment: Introductory Comment

EPA states in the Executive Summary (page ES-2) to the Economic Analysis that:

"EPA did not calculate costs for any program for which it does not have enforceable authority ... (nor) for NPDES sources which are not typically subject to numeric WQBELs....."

From a national policy perspective, this narrowing, of the focus of the Economic Analysis may be a

justifiable approach to cost benefit analysis. Local government, however, is not able to disregard the potential cost effects of the CTR on urban and agricultural runoff. Those potential costs will have to be defrayed with proceeds from the same pool of local rate payers responsible for paying for point source pollutant removal programs. In California, those ratepayers have made clear both their support for environmental protection and their reluctance to pay more than is necessary for that protection. A narrow definition of those costs included in the CTR Economic Analysis continues the pattern of fragmenting responsibility and authority for the protection of waterways, which in turn hinders creation and implementation of holistic strategies which would best serve the environment at least cost.

Questions for EPA on the Introductory Comment

Q.-1) If not EPA, who has the responsibility to define the aggregated costs of all water quality-related regulations?

Q.-2) San Jose's reading of federal policy initiatives (which include, but are not limited to, the Regulatory Flexibility Act, Executive Order 12866, and the Unfunded Mandates Reform Act) indicates that EPA is empowered to analyze the economic impact of federal regulations in a way that addresses both aggregated cost impacts as well as the fiscal reality of local level government. Why was this not accounted for in the current analysis?

Comment: SBSA is the regional wastewater treatment agency serving over 200,000 residents and businesses in southern San Mateo County. SBSA has a permitted capacity of 29 MGD average dry weather flow utilizing advanced treatment processes including filtration, discharging to the San Francisco Bay. While there are many concerns about various features of this regulation the main issue to SBSA is the inability to determine what the actual impacts will be due to uncertainties of how the California Toxics Rule (CTR) will be it-implemented by the state. Assumptions that the impacts will be small because of regulatory flexibility cannot be made (see Attachment A).

Response to: CTR-004-001

EPA believes that it is possible for a discharger to pursue regulatory relief which would result in a less stringent WQBEL through a TMDL, variance, site-specific criteria, or alternative mixing zone and that it properly included the possibility of these mechanisms in calculating the low-end cost in the Economic Analysis.

With respect to the comments on TMDLs, EPA's proposed rule does not alter the statutory and regulatory language requiring the states to perform TMDLs which are then submitted for EPA approval. The preamble merely acknowledges the reality that past and ongoing TMDL processes are often a collaborative effort by dischargers, the State, EPA , and other stakeholders and that EPA expects that this collaborative approach will be utilized in the future. With respect to the comments on pounds per day, pollutant trading, and interim limits, EPA believes the preamble discussion was appropriate in articulating current EPA policy but should not be put into regulatory language since these issues are related to permit implementation which is the primary responsibility of the State.

EPA disagrees with the comments on variances and site-specific criteria. EPA believes that even though these mechanisms are not specifically authorized as part of the CTR, the rule does not preclude these mechanisms from being pursued and approved by the State and EPA in the future consistent with current regulations. Therefore, for the purposes of crafting a reasonable cost analysis, the economic analysis incorporates the possibility of dischargers obtaining variances and site-specific criteria.

With respect to mixing zones, the preamble merely reiterates EPA's current policy on the proper application of mixing zones and does not restrict mixing zones any more than they were restricted in the past. EPA will review the State's new mixing zone policy for consistency with the Clean Water Act. A federal rulemaking would not have to accompany EPA approval of specific mixing zones in permits since, unlike a variance or site-specific criteria, a change in the mixing zone does not require a change in the underlying water quality standards of a specific waterbody. See also CTR-004-009 (Category G-05;

Mixing Zones and Dilution Credits).

Given the possibility that dischargers may be able to obtain permits with less stringent WQBELs based on the mechanisms discussed above, EPA calculated a low-end cost of the rule that included the costs of a discharger pursuing regulatory relief if the costs exceed a trigger of $200 per toxic-pounds equivalent removed.

EPA acknowledges that regulatory relief which would result in a less stringent WQBEL through a TMDL, variance, site-specific criteria, or alternative mixing zone may not always be available or appropriate. Therefore, in the final Economic Analysis, EPA calculated a high-end cost of the rule that did not contain any assumption of regulatory relief if the costs per toxic-pounds equivalent exceeded a specific "cost-trigger."

Given the uncertainty inherent in predicting how regulatory relief will be granted given that it will be decided by regulatory authorities on a case-by-case basis, EPA believes that its approach in the final Economic Analysis is a reasonable way of expressing the possible range of regulatory outcomes and the costs (and benefits) resulting from those outcomes.

Comment: 5. The District is concerned with the apparent complexity of calculating the various water quality criteria limits. In order to reduce the number of errors likely to occur as a result ofthe calculations, the District recommends that detailed step-by-step forms be created outlining the precise calculation methods for the various priority toxic pollutants.

Thank you for this opportunity to comment on the proposed rule. Sincerely,

STUART A. FARNSWORTH Senior Environmental Planner

Response to: CTR-007-006

EPA agrees that the calculations for various water quality criteria may be complex. To assist regulatory authorities in calculating various water quality criteria, EPA has included in the "General Notes" to the proposed CTR (see 62 CFR 42160 at pp. 42205-42208) and final CTR, a section containing formulas, tables, and additional information necessary for calculating various water quality criteria proposed in the CTR.

Comment: Dear Ms, Frankel:

The City of Thousand Oaks has reviewed the 40 CFR Part 131 Water Quality Standards; Establishment of numeric Criteria for Priority Toxic Pollutants for the State of California; Proposed Rule as published in the Federal Register, Vol. 62, No. 150, Tuesday, August 5, 1997, and offers the following comments:

The City applauds the EPA's encouragement and endorsement of maximum flexibility applied by the State to implement these priority pollutant criteria. To that end, the City agrees with EPA that the State of California should develop and promulgate its own comprehensive water quality standards and implementation procedures, in accordance with Section 303 of the federal Clean Water Act as expeditiously as possible. The City understands the agency's lack of resources to complete the entire rulemaking task for the State, but also suggests that the EPA appreciate the lack of resources the regulated community has to comply with partial and inflexible requirements. The same "Public" is the ultimate provider of these resources. It is therefore incumbent on all layers of government to assure the value received is at least commensurate with the cost.

Response to: CTR-009-001

As recognized by the commenter, EPA has chosen to defer to the State with respect to implementation procedures. To facilitate coordination between EPA and the State on issues pertaining to implementation of CTR criteria and regulatory flexibility outlined in the CTR preamble, EPA has provided lengthy formal comment on the State's draft Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California and Functional Equivalency Document (FED), and draft supplement and draft addendum to the supplement for the FED. EPA will continue to work closely with the State on CTR implementation issues and concerns. Pursuant to Executive Order 12866, EPA did prepare an economic analysis which provides an estimate of potential costs and benefits due to the implementation of the CTR.

Comment: Implementation Issues

It is made clear that the State Board will have the responsibility for determining implementation of the water quality criteria in the Rule and not the Agency. However, there are several implementation issues discussed in the Preamble. The relationship of the Agency to the State Board and to the Regional Water Quality Control Boards ("Regional Boards") is unclear and requires more specific explanation. Further, the Agency does not acknowledge some of the State Board's existing authority and policies, but frequently recognizes Regional Board Basin Plans.

The District supports the inclusion of any provisions that allow for state flexibility in implementation of the Rule. The Agency needs to re-examine its discussions, however, as some of them do not seem consistent with the Agency's own guidance. Finally, it is critical that the Agency work closely with the State Board on these issues. From a preliminary review of the State Board's Draft Policy for Implementation of Toxics Standards, which was just released, it is apparent that there has been no coordination on these issues. There are several inconsistencies and contradictions which should be resolved before the Rule is promulgated.

Response to: CTR-015-003

State Water Resources Control Board and Regional Water Quality Control Board authorities and policies are generally outlined and/or incorporated by reference into Basin Plans adopted by the Regional Water Quality Control Boards. To facilitate coordination between EPA and the State on issues pertaining to implementation of CTR criteria and regulatory flexibility outlined in the CTR preamble, EPA has provided lengthy formal comment on the State's draft Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California and Functional Equivalency Document (FED), and draft supplement and draft addendum to the supplement for the FED. EPA will continue to work closely with the State on CTR implementation issues and concerns.

Comment: 5. The proposed rule restricts the State's regulatory flexibility in permitting by establishing averaging periods and low flow conditions, and directives regarding establishing effluent limits for criteria not being adopted as part of the CTR. USEPA has preempted the State's flexibility by establishing averaging periods for applying acute and chronic aquatic life and human health criteria, and by establishing low flow conditions that must be used in developing limits based on proposed criteria.

These are implementation issues that should remain with the State regulatory authority.

Recommendation: The rule should be revised to delete all provisions that preempt the State's regulatory flexibility.

Response to: CTR-027-005b

EPA has adopted recommendations for averaging periods and low flow values because they are intrinsic to ensuring that the numeric values are protective of the designated use. These factors are part of the ambient condition necessary to protect the designated use, see preamble to the proposed CTR and Technical Support Document for Water Quality Based Toxics Control, U.S. EPA 1991, Section 2.3, and Appendix D. As acknowledged in the preamble, the State may develop and adopt criteria averaging periods and critical low flows that differ from EPA's recommendations, as long as they are scientifically supportable, but when EPA promulgates rules, it is using these averaging periods and flow recommendations as representing the best scientific judgement given all the uncertainties in deriving these factors.

Comment: The CTR criteria need to be specifically and directly linked in the regulations to the State's Implementation Policy. Furthermore, the CTR and the Implementation Policy need to be moved to more parallel tracks and reviewed and adopted at the same time, not in series. EPA needs to provide more specific direction to the State on how and under what conditions regulatory relief options will be pursued jointly by the State and/or Regional Boards and impacted dischargers. The concept of numeric triggers should be refined, or an equivalent threshold identified, above which specific regulatory relief options would be pursued and requirements for major treatment plant improvements held in abeyance. Without these types of commitments and the linkage of the two regulatory actions, there is no sound basis for the CTR cost estimates.

Comment: 7. Separate, sites-specific aquatic life criteria for copper and human health criteria for mercury should be adopted for Schell Slough, or alternatively EPA should specify implementation procedures for these criteria that will preclude unreasonable controls such as end-of-pipe treatment. To comply with the Clean Water Act and EPA regulations, EPA should consider specific water bodies. To fulfill the spirit of Presidential Executive Order 12866 and the requirements of the Unfunded Mandates Reform Act and the Regulatory Flexibility Act, EPA should evaluate regulatory alternatives based on an analysis of costs and benefits. Based on the assessment of costs and benefits described in "3" above, EPA should either adopt the criteria that is currently achieved, or alternatively specify implementation procedures that would allow the current discharge to continue (e.g., allowable Mixing zones and averaging periods and, for copper, a translator and water-effect ratio). Again, the District is amenable to continuing to address these constituents through pollution prevention measures and to assessing the actual impacts of these constituents in Schell Slough. Without EPA specifying such implementation procedures in the CTR, it is possible that the CTR could impose significant costs on the District (and the other small communities its serves) without providing a commensurate environmental benefit. In that case, the CTR would be inconsistent with the Clean Water Act, EPA regulations, Presidential Executive Order 12866, the Unfunded Mandates Reform Act and the Regulatory Flexibility Act.

Comment: Finally, Heal the Bay will review the implementation policy issued by the State to ensure that the policy includes a process to identify: (1) those criteria pollutants that, based on the recommendations of the task force and recent scientific data, should be more stringent than the proposed California Toxics Rule; (2) the process to perform the required CEQA analysis of those criteria; and (3) the time-lines for adopting the more stringent criteria.

Comment: Waste Load Allocation (WLA) is a flawed concept and UPI requests the EPA promulgate conditions for exemption as part of the requirement for compliance with such allocations.

The implementation of CWA Section 303(c)(2)(B) as discussed beginning on page 42184 causes numerous obstacles, both financial and technological, to facilities such as UPI. Our facility will be subject to water quality-based effluent limitations (WQBELs). Therefore, total maximum daily loads (TMDL) and WLAs will be utilized as future discharge permit criteria.

State Task Force recommendations also recognize that the TMDL process can be significantly labor and data intensive. UPI concurs that the TMDL process is significantly labor and data intensive. During the five year period from 1989 through 1993 UPI spent close to a million dollars ($1,000,000) on the studies of point source wasteload performance at its facility. The study was initiated to verify the efficacy of our waste water treatment system in removing chemical process constituents that were added to the water from the river (Delta) during use of the water as process water. Chain-of-custody and laboratory results for this study were documented in our required monthly self monitoring reports to the RWQCB.

The above study of efficacy of wastewater treatment prior to discharge is summarized in the following attached tables which show averages for three month periods over five full years.

Table 9. Summary of Discharge 001 Gross Mass Loading, lb/day Table 10. Summary of Discharge 001 Net Mass Loading, lb/day Table 11. Summary of Discharge 001 Net Concentrations, ug/l

Each table is shown in two sections. Section A shows the tabulation of results for cadmium (Cd), total chromium (Cr, total), hexavalent chromium (CrE+6), copper (Cu), total iron (Fe, total), dissolved iron (Fe, dissolved), lead (Pb), nickel (Ni) and zinc (Zn). Section B shows the tabulation of results for arsenic (As), mercury (Hg), selenium (Se), silver (Ag), tin (Sn), cyanide, phenolics, polyaromatic hydrocarbons (PAHs), naphthalene, and tetrachloroethylene. All analyses were done using approved standard procedures to determine the total concentration of each chemical. All results that were reported at minimum detection level (MDL) are included in the averages at one half of the reported MDL.

The attached tables illustrate the following: The gross lb/day discharge loadings (Table 9) show certain trends of improvement, eg, CrE+6, for which the process sources had been controlled. Note that since completion of the study compliance samples for CrE+6 during the most recent two year period have been reported at less than MDL. Other decreases, such as shown for Cd, Hg and Pb, are the result of improved analytical test procedures.

The net discharge lb/day loadings (Table 10) and net discharge ug/l concentrations (Table 11) show

many results that are at or below zero discharge for many constituents. Other net discharge ug/l concentrations are significantly below the applicable MDLs, which also indicates that the net concentration is essentially zero. This indicates that chemical control for most chemicals is essentially 100% complete and that no process constituents are contained in the permitted discharge, except as noted below.

Exceptions to the above are Cr, Sn, and phenolics for which the net results are significantly above zero.

The above study shows the substantial effort and expenditure that was required to verify performance with respect to chemicals of concern (COCs) for a specific source category (and for several additional chemicals that were added to the COC list). The list of COCs is being expanded to 126 in the proposed regulations, more than six times as large a list as was evaluated in our performance study.

While the use of the Waste Load Allocation (WLA) principle may sound good, it is only good if properly administered. Two criterion should be considered to make the use of WLAs practicable and administratively feasible for both the agencies and the dischargers.:

* The COCs applicable to WLA discharge compliance should be identified by the Administrator for each source category, per Title 33, Section 1316(b)(1).

* Each NPDES Permit Applicant shall analyze and report on chemical listed on the standard permit application every five years to verify which if any discharge chemicals are subject to WLA discharge compliances.

For the above reasons, UPI requests the EPA add the following to the end of Section 131.38(e)(1) of part 131 of Title 40:

"New and existing point source dischargers shall be considered to be in compliance with such WQBELs except for (i) any WQBEL constituent that is identified for the source category pursuant to Section 1316(b)(1) of Title 33, or (ii) any WQBEL constituent which may cause an increase in the receiving water due to such discharge as determined from information contained in the standard required permit application."

Response to: CTR-055-002b

The comment regarding wasteload allocations is outside the scope of this rule. The CTR sets criteria for pollutant levels in ambient water but does not address how wasteload reductions are to be allocated to sources of pollutants. Wasteload allocations are already addressed under current regulations and guidance. When developing effluent limitations for a NPDES permit, the permitting authority must consider effluent limitations based on both the technology available to treat the pollutants and limitations that are protective of the designated uses of the receiving water. The intent of technology based effluent limitations is to require a minimum level of treatment for industrial/municipal point sources based on currently available treatment technologies. For industrial sources, national effluent limitations guidelines are developed based on the demonstrated performance of a reasonable level of treatment that is within the economic means of specific categories of industrial facilities. However, effluent limitations guidelines are not always established for every pollutant present in an industrial discharge and, in many instances, the guidelines are established only for those pollutants which are necessary to ensure that industrial facilities will comply with the technology-based requirements of the CWA (i.e., BPT, BCT, BAT, NSPS).

NPDES permitting regulations at 40 CFR 122.44(d) require that if, after technology based effluent limitations are applied, the permitting authority projects that any point source discharger may exceed an applicable water quality criterion, then a water quality based effluent limitation for that pollutant must be imposed. In addition, Section 301(b)(1)(c) of the Clean Water Act requires that effluent limitations be established as necessary to meet water quality standards. Neither EPA nor the states are required to set water quality based effluent limits at any higher level because of technological difficulties in measuring compliance. See NRDC v. EPA, 859 F. 2d 156, 208 (D.C. Cir. 1988). Water quality based effluent limitations are usually calculated from WLAs based on TMDLs, or on WLAs estimated for a single point source using simplified water quality models. These regulations also require that all effluents be characterized by the permitting authority to determine the need for water quality based effluent limitations. (The Technical Support Document for Water Quality-based Toxics Control (1991) provides additional guidance on collecting monitoring data for establishing water quality based effluent limits.) In accordance with these regulations, when determining whether a water quality based effluent limitation is needed in a permit, the permitting authority is required to consider, at minimum: (1) existing controls on point and nonpoint sources of pollution; (2) the variability of the pollutant or pollutant parameter in the effluent; (3) the sensitivity of the species to toxicity testing; and (4) where appropriate, the dilution of the effluent in the receiving water. The permitting authority must also consider whether technology based limits are sufficient to maintain State water quality standards.

Given the requirements outlined above, EPA believes that the requested changes to the end of 40 CFR 131.38(e)(1) are not appropriate within the scope of today's rule.

Comment: 1995 Public Advisory Task Force Efforts

Following the State's rescission of the ISWP in 1995, eight Public Advisory Task Forces were established to deal with specific issues and problems that either arose after the plan was adopted in 1991 or were carried over from the pre-adoption public review period. These task forces were comprised of representatives from numerous public groups and agencies, including the EPA, In hindsight, it is important to note that many of the problems that were identified and addressed by the task forces review can be attributed to the similarities between the proposed Rule and the ISWP. In view of the fact that the task forces were able to achieve consensus with respect to their individual recommendations for plan revision, we believe that the EPA should acknowledge these efforts in the CTR as a means of encouraging the development of an EPA-approved State priority-pollutant plan.

Comment: It is important that the significant efforts and accomplishments of the Task Forces not be ignored in this CTR promulgation process. CDA suggests that EPA consider providing more specific guidance to the State on the need for, and use of, regulatory flexibility beyond its statement that "EPA supports the State's consideration of stakeholder Task Force recommendations to help deal with these controversial and complex issues." (p. 42185)

Comment: The CTR criteria need to be specifically and directly linked in the regulations to the State's Implementation Policy. Furthermore, the CTR and the Implementation Policy need to be moved to more parallel tracks and reviewed and adopted at the same time, not in series. EPA needs to provide more specific direction to the State on how and under what conditions regulatory relief options will be pursued jointly by the State and/or Regional Boards and impacted dischargers.

CDA appreciates the opportunity to comment on the draft CTR.

Comment: We recommend that EPA:

1. Incorporate in the rule, not the preamble, the implementation of the regulatory relief such as the tiered mixing zones, the use of translators, the use of the water effects ratio, interim limits and compliance schedules. Without these assurances and inclusion of these in the rule the economic analysis is useless.

Response to: CTR-090-009

EPA believes that it is not necessary to include implementation of regulatory relief such as tiered mixing zones, translators, and interim limits in today's rule since these issues are closely related to the issuance of permits which is properly deferred to the State, the permitting authority. In fact, shortly after the publication of the proposed CTR, the State's Draft Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California proposed the use mixing zones, translators, water effects ratio, interim limits, and compliance schedules as appropriate to develop discharge limits for permits.

The CTR does include a compliance schedule provision and incorporates the water effects ratio into the calculation of the water quality criteria if appropriate.

EPA disagrees with the commenter's assertion that the economic analysis is useless unless the CTR includes the implementation measures stated by the commenter. EPA believes that the economic analysis is useful since it presents a range of possible economic impacts which vary depending upon a number of assumptions about how the State could implement the rule, including the use of regulatory relief.

Comment: Relationship Between the CTR and State Implementation

The City of San Jose understands the level of effort that has gone into this rulemaking process. We find much of the preamble to the Rule to encouraging and generally support the road map to implementation of the rule that is laid out in the preamble.

The preamble describes a number of potential regulatory approaches that could be used by the State to implement the criteria proposed in the CTR. Regulatory tools such as translator mechanisms, water effect ratios, site specific objectives, interim limits while performing special studies, mixing zones, compliance schedules and trading programs are all good examples of regulatory approaches that should be used, especially under conditions such as those which exist in South San Francisco Bay, where water quality has improved tremendously in the recent past, yet full attainment of water quality objectives is still not possible.

EPA's Economic Analysis makes it clear that EPA is not only supporting use of these regulatory tools by the State, but is in fact assuming that they will be used. The accuracy of this assumption is questionable at this point in time, in light of the State's historic approach to implementation. Since EPA has the responsibility to approve any of the implementation procedures that the State decides to employ, we believe it is necessary for EPA to play an active role in the implementation phase.

Although we have not had an opportunity to review and comment on the recently issued "Proposed Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays and Estuaries of California", we believe that the implementation policy presents an opportunity to resolve the uncertainly concerning whether the State will adopt reasonable, flexible approaches to implementing the criteria that would be established by the CTR. We are requesting that the uncertainties concerning State implementation be resolved before the CTR is finalized.

Comment: I have one more thing I can hardly read here. I was just referring back to Phil Bobel, who mentioned the state's process.

I would certainly not encourage you to do what the state has tried to do for the last three years, which is a very complicated, totally burdensome task force stakeholder process, which had most of the environmental groups walking away from it for lack of resources to keep up with all of the meetings.

And that had the result of nothing, essentially no -- I guess implementation came on Friday suddenly, but

no criteria came out of that process at all, despite all those meetings. So I certainly don't encourage you to follow that.

I think a reasonably swift process here is warranted. We're already four years late, so I would certainly encourage you to finish this rule as quickly as possible, and hopefully people will be able to make intelligent comments about it.

Comment: 2. Since the preamble implies that CTR criteria may be applied in NPDES permits for municipal storm water dischargers as numeric effluent limitations, the proposed rule is flawed with regard to: a) setting attainable, scientifically valid criteria in a manner consistent with state and federal regulatory approaches; b) assessing the potential economic impact on the public served by municipal storm water dischargers; c) assessing environmental impacts pursuant to the National Environmental Policy Act and the Endangered Species Act; and d) providing for the coordinated review and evaluation of the proposed CTR in conjunction with the proposed State Implementation Plan.

Response to: CTR-031-002e

EPA has coordinated the CTR schedule to coincide as closely as possible with the State's Implementation Plan. However, EPA wishes to promulgate the CTR as soon as possible. Therefore, EPA could not commit that the proposed CTR would be released at the same time as the proposed State Implementation Policy. For the same reasons, EPA cannot ensure that the final CTR will be released at the same time as the final State implementation policy. EPA and the State have made every effort to ensure that its separate actions will work well together and are consistent with one another.

With respect to ESA, EPA has completed consultation as required by Section 7 of the ESA. With respect to compliance with NEPA, section 511(c) of the Clean Water Act excludes this rulemaking from the requirements of NEPA. The comment also assumes that stormwater discharges subject to numeric effluent limitations will have to be treated by new end-of-pipe facilities. As explained in the response to Storm Water Economics Comments (Category J, Comment # 040-004), EPA believes that implementation of criteria as applied to wet-weather discharges will not require the construction of end-of-pipe facilities.

Comment: d. The proposed CTR and the recently released proposed State Implementation Plan must be fully integrated, internally consistent, and their combined effect thoroughly assessed. However, EPA has allowed only one week of overlap between the proposals for stakeholder review.

The EPA concedes within the proposed CTR that the criteria themselves lack substance without the corresponding implementation measures. EPA also acknowledges that the economic impact of the CTR can not be fully evaluated without consideration of the ISWP. However, the EPA can not simply abdicate its responsibility to assess the impact of its proposal, nor can it expect stakeholders to accept the proposed CTR without full understanding of its implementation.

All stakeholders require the opportunity to evaluate the proposed CTR and Implementation Plan together as a comprehensive, cohesive body of regulation.

Response to: CTR-031-008b

EPA has coordinated the CTR schedule to coincide as closely as possible with the State's Implementation Plan. However, EPA must promulgate the CTR as soon as possible to comply with its statutory obligations under the Clean Water Act. Therefore, EPA could not commit that the proposed CTR would be released at the same time as the proposed State Implementation Policy. For the same reasons, EPA cannot ensure that the final CTR will be released at the same time as the final State implementation policy. EPA and the State have made every effort to ensure that its separate actions will work well together and are internally consistent.

EPA agrees that the CTR without the corresponding implementation measures would have no direct effect on permitees. However, EPA disagrees that it has abdicated its responsibility to assess the impact of the proposal. EPA has projected the potential economic impacts of the CTR using reasonable implementation measures which are either already used by the State or are recommended in EPA's Technical Support Document (TSD) EPA believes this methodology is appropriate and reasonable since EPA cannot anticipate the final State implementation measures. EPA's estimates measure the impact of the CTR combined with the implementation procedures EPA believes are reasonable for the State to adopt. If the State adopts implementation procedures that differ from EPA recommended procedures, the change in impact will be reflected in the State's economic analysis.

Comment: The CTR criteria need to be specifically and directly linked in the regulations to the State's Implementation Policy. Furthermore, the CTR and the Implementation Policy need to be moved to more parallel tracks and reviewed and adopted at the same time, not in series. EPA needs to provide more specific direction to the State on how and under what conditions regulatory relief options will be pursued jointly by the State and/or Regional Boards and impacted dischargers. The concept of numeric triggers should be refined, or an equivalent threshold identified, above which specific regulatory relief options would be pursued and requirements for major treatment plant improvements held in abeyance. Without these types of commitments and the linkage of the two regulatory actions, there is no sound basis for the CTR cost estimates.

Response to: CTR-032-005a

See response to CTR-031-008b. With regard to providing regulatory relief, the State has discretion to what extent it will provide regulatory relief in its water quality standards program and NPDES program. EPA disagrees with the assertion that it has no sound basis for estimating costs if it does not link both regulatory actions. The numeric cost triggers in EPA's economic analysis are used to establish a lower bound of costs since EPA cannot anticipate exactly how the State will implement regulatory relief on a case-by-case basis. To provide a more conservative cost estimate, EPA did not use the numeric cost triggers for its upper bound cost estimate. In effect, the upper bound cost estimate assumes that the State will not provide any regulatory relief.

Comment: Equally important, we also urge EPA to work more closely with the State Water Resource Control Board (SWRCB), including such steps as the use of simultaneous comment periods and joint final promulgation. This heightened level of coordination would truly enhance the effectiveness of both EPA and the State's efforts to comply with Section 303(c)(2)(B) of the Clean Water Act, since, as EPA acknowledges in numerous locations in the Preamble, the impacts of the CTR criteria depend greatly on the State's approach to implementation (see, for instance, pp. 42188 and 42191). Thus, an important reason for EPA to grant our request to reopen the comment period is to allow sufficient time to review the draft CTR in the context of the SWRCB's recently released Statewide Implementation Policy. Thus, we ask that EPA extend the comment period until December 10, 1997, the SWRCB's public comment deadline, or, at a minimum, for 30 days.

Comment: EPA should use a collaborative approach to address the major issues raised by BADA and other commenters. The CTR is extremely important to all stakeholders, including the regulated community, the environmental community, and the regulatory agencies. The traditional rule-making approach does not lend itself to resolving the issues raised in a manner that will satisfy the various stakeholders. The State Plan Task Force experience has demonstrated that varying interests can come together and quickly reach consensus on how to address statutory and regulatory requirements in a mutually satisfactory manner. BADA would encourage EPA to use such an approach in preparing a final CTR and would offer to assist EPA is organizing such an approach.

Response to: CTR-054-015

EPA has decided that to promulgate the CTR in a timely manner it is necessary to use the traditional rule-making approach rather than a collaborative approach involving stakeholders or a regulatory negotiation approach. The EPA must promulgate CTR water quality criteria as quickly as possible to fill the gap in California that has existed for five years. In promulgating a final rule EPA has considered all written and verbal comments as well as applicable State Plan Task Force recommendations. After consideration of all comments, EPA must ultimately promulgate criteria that are protective, scientifically defensible, and meet the requirements of the Clean Water Act. EPA believes the traditional notice and comment rule-making approach is the best way of fulfilling its obligations under the Clean Water Act in the most timely manner.

CROSS REFERENCES B

Comment: We are writing to you on behalf of Tri-TAC and the California Association of Sanitation Agencies regarding the forthcoming publication of the proposed Water Quality Standards for Toxic Pollutants for California ("California Toxics Rule") and release of draft state implementation policies

and functional equivalent document. As you are aware, Tri-TAC and CASA have supported the decisions of the U.S. Environmental Protection Agency (EPA) and the State Water Resources Control Board (SWRCB) to eliminate duplication in state and federal water quality rulemaking activities through the pursuit of a collaborative approach. Our understanding is that, through this approach, EPA will adopt water quality criteria for toxic pollutants that will apply in California and the SWRCB will adopt implementation policies that will guide the Regional Water Quality Control Boards in the implementation of those criteria. In a later phase, the SWRCB intends to adopt state criteria that will replace the federal criteria.

We have been informed recently by EPA staff that publication of the draft California Toxics Rule is imminent and is expected to take place by the end of July. According to staff, a 50-day public comment period will be provided. We have heard from SWRCB staff that they plan to release the proposed state implementation policies and FED on September 12. We have asked each agency to provide an overlapping comment period for these draft regulations, and have been informed that the current schedule will provide about one week of overlap, assuming that both agencies release their drafts on schedule. We are quite concerned about this situation in several respects. First, we believe that a one-week overlap does not provide sufficient time for a meaningful review and comparison of the regulations (and comparative analysis of the economic impact analyses, which depend heavily on the implementation policies). We believe that a minimum of 30 days is necessary for the overlap review period, and that the slight delay that this would create for EPA is warranted and would have a negligible impact on the timing of the overall rule promulgation process. Second, we are very concerned about whether the SWRCB will meet its projected release schedule. While we believe that sufficient time has been available to prepare the draft policies and FED, it is imperative that the SWRCB do everything possible to meet its commitment to move forward in a timely manner, and that any extension of EPA's comment period not be used to adjust the state's schedule. Third, we understand that both EPA and the SWRCB plan to hold public hearings regarding their respective proposals this fall. We believe that it is important that representatives of both agencies attend and participate in the hearings that each agency holds, and that an explanation be provided regarding both the CTR and the implementation policy.

In short, we request that EPA and the SWRCB carefully review their efforts to coordinate both the development and release of the California Toxics Rule and State implementation Policies, and specifically, we request that EPA provide a comment period sufficient to ensure that a 30-day overlap will occur with the SWRCB's release of the FED for the State Implementation Policies. More generally, we hope that both agencies will offer flexibility in the promulgation process so that the various scheduling and review needs can be met. We hope that your respective agencies will continue to move forward with a collaborative rulemaking process, and are concerned that cooperation not break down due to institutional barriers at this point in the process.

Thank you for your consideration of our comments. We would be happy to discuss these issues further at your convenience.

Response to: CTRE-001-001b

Comment: The Bay Area Dischargers Association (BADA) is comprised of 10 POTWs in the San Francisco Bay Area. Our five largest charter members include the Central Contra Costa Sanitary District, City and County of San Francisco, City of San Jose, East Bay Dischargers Authority, and East Bay Municipal Utility District. Together BADA agencies provide wastewater service to most of the Bay Area.

BADA requests that the U.S. EPA allow at least 90 days for public review of the proposed California Toxics Rule (CTR). We understand the proposed rule will be published in the Federal Register toward the end of this month. The reasons for our request are as follows:

1. The CTR could have a significant economic impact on California municipalities and businesses. In order to properly assess the impacts of the proposed CTR standards, it is necessary to know how the standards are to be implemented. Yet, the proposed implementation provisions being developed by the State Water Resources Control Board will not be available until September 12, 1997. The several days of overlap are insufficient for California municipalities and businesses to assess the economic and environmental impacts of the proposed standards. At least 45 days of overlap is needed.

2. The U.S. EPA has spent more than three years developing the proposed CTR, in part because of its importance. It is therefore, reasonable to provide at least 90 days for the public to review and comment on the rule, especially considering its potential economic impact on the State and the unavailability of the implementation provisions

3. It is recommended that the EPA work closely with the SWRCB during the review period to define the implementation policy and procedures that the EPA would be likely to approve.

For these reasons, BADA urges you to issue a notice extending the review period from 45 days to 90 days.

Response to: CTRE-023-001b

Regarding request for extension in the comment period see section on Comment Period (Category B, CTR-001-001).

EPA did review the State's proposed implementation policy and procedures. EPA provided written comments to the SWRCB on December 9, 1997. These comments and other communications with the SWRCB are likely to facilitate EPA's review of the final SWRCB implementation plan.

Comment: MR. BOBEL: Thank you, Steve.

I'm Phil Bobel. I represent Tri-TAC, an organization of sewage treatment plants, the POTWs as we call them, made up of three groups: CASA, the California Association of Sanitation Agencies; the League of Cities; and the California Water Environment Association.

And later this afternoon you're going to hear from Bob Reid who represents CASA. And our comments are essentially the same, so I'm going to not repeat and just summarize a couple things.

I was even going to say you guys had done a really good job. But in light of all the previous speakers, I deleted that part of my testimony.

I will try to be positive and constructive. I promised to do that. In describing the nature of my comments on your little form, I put that I would be constructive. So I will do that.

The first point I'd like to make is positive. I think that the coordination you're doing with the state is great. The fact that we're going to have coordination with the feds focusing on the numeric criteria, the state focus on the implementation policy, working to come up with a system that will serve us all, is a good way to use resources of both organizations.

I applaud you for that and hope you will be able to pull that off. This is different than what we've tried to do before, and it will require some creativity.

One specific thing that I think would help if we did, is to allow all of us to see both what the state is proposing and what the feds are proposing, so we need a little more time in this comment period.

We've appealed before and been told no, but I still put that on the table as a good idea for the ultimate goal of a coordinated, consolidated, as much as possible, federal and EPA approach to this thing.

If you don't do that, or even if you do do that, I think it's going to require some other kinds of creativity as we move out of -- away from your hearing and toward a final rule.

And in that period of time, I would ask you and the state to sit down together and see what kind of a process you can use to take the comments that you'll hear from your federal regs and the comments you hear on the state plan, and put those together, hear more back from folks that are interested and come up with a package that makes sense.

You're going to need some way of going back to interested parties over a longer period of time -- communicating, coordinating -- and I would refer you to the process that the state used on their task force

approach and suggest that we need something like that as we move to the future. Creativity is going to be needed.

Response to: CTRH-001-019b

EPA has decided that to promulgate the CTR in a timely manner it is necessary to use the traditional rule-making approach rather than a collaborative approach involving stakeholders or a regulatory negotiation approach. The EPA must promulgate CTR water quality criteria as quickly as possible to fill the gap in California that has existed for five years. In promulgating a final rule EPA has considered all written and verbal comments as well as applicable State Plan Task Force recommendations. After consideration of all comments, EPA must ultimately promulgate criteria that are protective, scientifically defensible, and meet the requirements of the Clean Water Act. EPA believes the traditional notice and comment rule-making approach is the best way of fulfilling its obligations under the Clean Water Act in the most timely manner.

EPA and the State have made every effort to ensure that its separate actions will work well together and are internally consistent.

Comment: I also want to back up the comment that Phil made about CASA. San Francisco is a member through the League of Cities, with Tri-TAC -- San Francisco is a member of Tri-TAC through the League of Cities, and also agree that you need to be creative here.

You may he taking the approach that this is a rulemaking for you, and once you're done making the rule, you're out. But because of the fact that we've come to a different perspective with you adopting numbers and statements looking at implementation, you're going to have to do an awful lot of creative work to -- working outside of models we're used to, in order to get to something that's going to make sense for the waters of the State of California, that's going to make sense for the people fishing and eating the fish.

So I really want to back up Phil and everyone else that makes those comments. That's very critical.

Comment: I think I want to close again with there's some really great things in there. There's also some flaws. And I think we're really missing the boat if we don't try to think outside of just a regular rulemaking here and begin thinking about a watershed approach, how we're going to get to making these waters clean.

And that's got to take a collaboration between EPA and the state that we haven't probably seen before. And I know you're attempting to do that. I want to encourage you to keep working on that.

Thank you.

Comment: MR. TUCKER: My name is Dave Tucker and I will be delivering Lou Garcia's comments today. He stepped away for a few minutes, then reappeared, but I got overcome by this. I'll keep my comments brief.

My comments will be on behalf of the City of San Jose Environmental Services Department. We will keep our comments brief today. We will be following up with extensive written comments by the close of the comment period next week.

I'm going to discuss two topics this afternoon. One is about the things that we support highly, and that is the flexibility and innovation that is included in the program regarding water quality standards.

However, we do recommend that EPA take a more active or proactive approach to employing such flexibility during the interim period between the federal promulgation and that of the completion of the statewide process, and that EPA be an active participant, actually extending into the water quality

planning and implementation process to California as an on-line stakeholder.

Response to: CTRH-001-056

EPA did review the State's proposed implementation policy and procedures. EPA provided written comments to the SWRCB on December 9, 1997. These comments and other communications with the SWRCB are likely to facilitate EPA's review of the final SWRCB implementation plan. EPA plans to continue to be an active participant into the water quality planning and implementation process in California.

Comment: As you are aware, the California Policy for Implementation of Toxics Standards for Inland Surface Water, Enclosed Bays, and Estuaries of California, the proposed policy, was issued a few days ago. EPA and State essentially had the same objective to establish water quality criteria that are implementable for the water of California. Therefore, it is necessary for regulators and dischargers alike to fully comprehend the consequences of these rules on similar issues but from perhaps a different perspective.

Consequently, we strongly urge EPA to allow for additional 30 days for you and for us to fully review both documents together. We also urge EPA and State to coordinate these two rule-making process to minimize inconsistencies that might otherwise occur, EPA is the final focal point of this concern because the process of State's obtaining EPA approval of ISWP and EBEP will be greatly enhanced if EPA and State can work together; and without EPA's approval, State's plan will be no good. So I think it will be ideal if CTR and the State's proposed policy can be promulgated simultaneously.

Thank you again for the opportunity to address you.

Response to: CTRH-002-021b

Regarding request for extension in the comment period see section on Comment Period (Category B, CTR-001-001).

EPA did review the State's proposed implementation policy and procedures. EPA provided written comments to the SWRCB on December 9, 1997. These comments and other communications with the SWRCB are likely to facilitate EPA's review of the final SWRCB implementation plan.

EPA has coordinated the CTR schedule to coincide as closely as possible with the State's Implementation

Plan. However, EPA must promulgate the CTR as soon as possible to comply with its statutory obligations under the Clean Water Act. Therefore, EPA could not commit that the proposed CTR would be released at the same time as the proposed State Implementation Policy. For the same reasons, EPA cannot ensure that the final CTR will be released at the same time as the final State implementation policy. EPA and the State have made every effort to ensure that its separate actions will work well together and are internally consistent.

FOREWORD

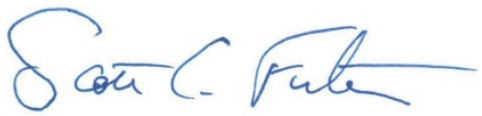
I am pleased to present *EJ Legal Tools*, a review of legal authorities under the environmental statutes administered by the U.S. Environmental Protection Agency that may have contributive application in the effort to advance environmental justice under *Plan EJ 2014* – the Agency's overarching strategy for advancing environmental justice.

Plan EJ 2014 implements one of Administrator Lisa P. Jackson's top priorities: expanding the conversation on environmentalism and working for environmental justice. That priority reflects the recognition that all too often, minority and low-income communities in our country suffer disproportionate pollution burdens and the intensified health risks and environmental quality-based obstacles to economic growth that attend such burdens. *Plan EJ 2014* focuses EPA's efforts to address these conditions by more effectively integrating environmental justice into our programs, policies, and daily work.

Plan EJ 2014 called for the Office of General Counsel to identify legal authorities under the federal environmental statutes that bear meaningfully on the environmental justice challenge. This document responds to that call. It identifies numerous legal tools that EPA may consider using to more fully ensure that its programs, policies, and activities fully protect human health and the environment in minority and low-income communities. Some of the tools we have identified are already in use today; others have not yet been applied in an environmental justice setting.

EJ Legal Tools should be viewed as a starting point, rather than end point, in the examination of legal authorities. It does not purport to consider every possible contributive authority; rather it focuses on those authorities that appear to be most relevant to the environmental justice challenge as we currently understand it. Moreover, consistent with the leading-by-example orientation of *Plan EJ 2014*, *EJ Legal Tools* looks principally through the lens of EPA as implementer, leaving for further examination and discussion the question of how environmental justice-related legal authorities might inform the activities of states and tribes operating EPA-approved programs and EPA's oversight of those activities. Accordingly, *EJ Legal Tools* should be regarded as a living document, subject to future addition and adjustment.

As the Agency moves forward, its course of action will of course be based not only on its legal authority, but also on sound science and public engagement – all stitched together by good policy judgment. *EJ Legal Tools* is thus intended to serve as a part of an enabling environment for policy judgments that can lead toward a future where all people, regardless of ethnicity or income, have clean air, water, and land in the places where they live, work, play, and learn.



Scott C. Fulton
General Counsel
U.S. Environmental Protection Agency

This page intentionally left blank.

TABLE OF CONTENTS

INTRODUCTION

This document is designed to identify legal tools to help the U.S. Environmental Protection Agency (EPA) advance its goal of environmental justice in the United States. EPA defines "environmental justice" as "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies."[1] The goal of environmental justice is to ensure that all communities and persons across the Nation, including minority, low-income, and indigenous populations overburdened by pollution, receive full human health and environmental protection.[2] Environmental justice is a central element of EPA's mission to protect human health and the environment and is one of EPA's top priorities.

This document provides an overview of a number of discretionary legal authorities that are or may be available to EPA to address environmental justice considerations under federal statutes and programs. It grows out of EPA's renewed commitment to environmental justice embodied in *Plan EJ 2014*, which marks the forthcoming 20th anniversary of Executive Order 12898, entitled "Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations" (Feb. 11, 1994).[3] *Plan EJ 2014* is a comprehensive framework for advancing EPA's environmental justice priorities. It specifically calls for the Office of General Counsel (OGC) "to identify opportunities to utilize EPA's statutory authorities to advance environmental justice."[4]

In response to *Plan EJ 2014*, this document consolidates, updates, and expands on OGC's past work on the subject of environmental justice. That work began in earnest over 17 years ago in support of EPA's efforts to implement Executive Order 12898 and its accompanying Presidential memorandum.[5] Part of that effort focused on environmental justice opportunities in the context of environmental permitting programs, and led to a memorandum issued by then-General Counsel Gary S. Guzy, entitled "EPA Statutory and Regulatory Authorities Under Which Environmental Justice Issues May Be Addressed in Permitting" (Dec. 1, 2000).[6] *EJ Legal Tools* reaffirms the principles set forth in that memorandum, expands on its permitting discussion, and addresses other EPA authorities. An understanding of the Agency's legal tools for achieving environmental justice is critical because Executive Order 12898 itself is not a source of authority. Instead, Executive Order

[1] *Plan EJ 2014* (Sept. 2011) at p. 3 (discussing how EPA also defines the terms "fair treatment" and "meaningful involvement" for purposes of achieving environmental justice).

[2] Like *Plan EJ 2014*, this document uses the term "overburdened communities" as the way "to describe the minority, low-income, tribal, and indigenous populations or communities in the United States that potentially experience disproportionate environmental harms and risks as a result of greater vulnerability to environmental hazards." *Id*. at p. 1. & n. 1.

[3] 59 Fed. Reg. 7629 (Feb. 16, 1994) (codified at 3 C.F.R. 859).

[4] *Plan EJ 2014* at p. 23.

[5] 30 Weekly Comp. Pres. Doc. 279 (Feb. 11, 1994).

[6] The memorandum is available at: http://www.epa.gov/environmentaljustice/resources/policy/ej_permitting_authorities_memo_120100.pdf.

12898 calls on federal agencies covered by it to implement its provisions on environmental justice to the greatest extent practicable and permitted by existing law.[7]

As highlighted in the Presidential memorandum accompanying Executive Order 12898, existing environmental and civil rights statutes provide many legal authorities that, in appropriate circumstances, may provide opportunities to ensure that federal programs, policies, and activities do not have disproportionately high and adverse human health or environmental effects on minority or low-income communities, including tribal communities. This document analyzes EPA's statutes and their relevant regulatory standards for action to protect public health or welfare and the environment. It also covers EPA's cross-cutting and non-regulatory programs. It identifies instances when EPA may exercise its discretion to advance environmental justice under existing policy, guidance, and regulations.

It is important to emphasize not only what this document is – a review of what may be some of the more significant potential environmental justice opportunities EPA's policy makers have discretion to consider – but also what it is not. Consistent with the theme of *Plan EJ 2014*, *EJ Legal Tools* focuses principally on EPA's opportunities for advancing environmental justice when EPA is the implementing authority. For the most part, *EJ Legal Tools* does not focus on the actions of state, tribal, or local governments when they are the implementing authority. It also does not attempt a discussion of ways that EPA may advance environmental justice through its alternative dispute resolution or enforcement programs.

Significantly, *EJ Legal Tools* is not a document prescribing when and how the Agency should undertake specific actions. While some of the legal authorities are clear, others may involve interpretive issues or legal risk that call for further analysis. Without the context of specific applications, this document does not attempt to fully characterize any such legal risks. Policy decisions about undertaking particular actions are the responsibility of the Agency's program offices, which consider a wide range of questions beyond the issue of a particular action's legal defensibility, such as budgetary or other practical constraints on implementation, or the benefits or risks of using a legal tool in a given circumstance. Moreover, this document is not an exhaustive inventory of every conceivable legal authority; rather, it attempts to identify some of the leading opportunities that may have viability both in terms of legal defensibility and practicality.

This document should be regarded as a living document. As EPA gains experience working to achieve environmental justice and using the available legal tools, this document may be supplemented and adjusted, as appropriate. The desirability and the effectiveness of any particular legal tool ultimately will depend on the answers to questions such as these:

- Is the science regarding an activity or program sufficiently well developed to provide a sound basis for decision making?
- How strong is the factual basis for predicting that EPA's actions will be effective?
- Will the specific action or measure address the environmental or public health impacts on the affected population?

[7] *See* Executive Order 12898, Sections 1-101 and 6-608.

- Will adopting a new policy or approach (or altering an existing one) create, increase or reduce regulatory uncertainty?
- Does the policy or approach involve a function that could be effectively and efficiently carried out at the federal level?
- Are the public participation measures planned appropriate to provide transparency and meaningful participation for the affected population?
- Will the regulated activity have indirect environmental benefits to the community or unintended environmental or socio-economic costs?
- Will the regulated activity relieve, or avoid adding to, cumulative impacts?
- Would use of the discretionary authority promote the community's transition to clean technologies?
- What resources are needed to effectively carry out the activity?

These are primarily policy questions, although their answers may affect how strong the rationale is for EPA's action and, thus, the action's legal defensibility. The questions are included here to illustrate the type of variables relevant to a decision of whether to invoke an authority identified in this document under a particular set of circumstances.

As noted above, Executive Order 12898 calls on federal agencies, including EPA, to make environmental justice part of their mission "[t]o the greatest extent practicable and permitted by law."[8] We hope that, thoughtfully considered and deployed, *EJ Legal Tools* can serve as a meaningful resource for continued EPA efforts to advance its goal of achieving the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development and implementation of environmental laws, regulations, and policies.

CHAPTER ONE: CLEAN AIR ACT PROGRAMS

INTRODUCTION

EPA has various discretionary authorities that give, or may give, it opportunities to promote environmental justice under programs implementing the Clean Air Act (CAA).[9] The following discussion focuses on addressing and describing opportunities identified to date in permitting and rule development under the CAA and other related environmental statutes. Additional opportunities may be identified as the Agency gains further experience in addressing environmental justice considerations.

The potential for taking environmental justice considerations into account varies greatly across the various CAA programs. A general caveat applies: Because the primary authority and responsibility to select and implement air pollution control measures often rests with the states and with authorized Indian tribes, EPA may have limited authority to influence state or tribal decisions. Nevertheless, the CAA does afford EPA opportunities to consider environmental justice in certain standard-setting and permitting contexts. Because much of this chapter describes opportunities rather than current practice, case law directly addressing consideration of environmental justice under the CAA is limited and many of the opportunities described in this chapter are untested.

This chapter groups the relevant authorities into five broad categories: (1) standard setting, which includes new source performance standards, standards for solid waste incinerators, hazardous air pollutant standards, national ambient air quality standards (NAAQS), and mobile source standards; (2) NAAQS implementation; (3) permitting, which includes the new source review preconstruction permit program and the title V operating permit program; (4) provisions relating to Native American communities and federally recognized Indian tribes; and (5) miscellaneous additional provisions.

STANDARD SETTING

I. NEW SOURCE PERFORMANCE STANDARDS

Section 111 of the CAA contains several provisions that could accommodate the incorporation of environmental justice considerations, such as impacts on or participation in decision-making by minority, low-income, or indigenous populations. First, section 111(b) requires EPA to list categories of stationary sources that "cause[], or contribute[] significantly to, air pollution which may be reasonably anticipated to endanger public health or welfare." In determining priorities for promulgating standards for listed categories of sources, EPA is to consider under section 111(f)(2)(B) "the extent to which each such pollutant may reasonably be anticipated to endanger public health or welfare." Together, these two provisions could facilitate the advancement of environmental justice by giving EPA discretion to consider how or whether certain stationary sources particularly impact minority, low-income, or indigenous populations, and to consider the health impacts of the emissions from those sources. While EPA retains the

[9] 42 U.S.C. §§ 7401- 7671q.

authority to add new source categories to the list and could consider environmental justice factors in deciding what categories to add, there are currently no plans to significantly expand the list. EPA has already promulgated standards for all of the listed source categories and is required by statute to review and, if appropriate, revise those standards at least every eight years.

II. STANDARDS FOR SOLID WASTE INCINERATORS

The CAA provides specific authority to EPA to establish siting requirements for solid waste incinerators that could include environmental justice considerations, such as impacts on or participation in decision-making by minority, low-income, or indigenous populations. Section 129(a)(3) of the CAA provides that standards for new solid waste incinerators include "siting requirements that minimize, on a site specific basis, to the maximum extent practicable, potential risks to public health or the environment." Most of the standards that EPA initially promulgated for each category of solid waste incineration units were remanded to the Agency for further action. EPA recently issued revised standards for commercial and industrial solid waste incinerators, and is currently in the process of issuing revised standards for municipal waste incinerators and other categories of solid waste incinerators. EPA also recently issued standards for sewage sludge incinerators.[10] On May 20, 2011, EPA delayed the effective date of the emissions standards for commercial and industrial solid waste incinerators until the completion of reconsideration proceedings or pending litigation, whichever comes first.

The current standards for large and small municipal waste incinerators require new sources to develop a siting analysis that evaluates how the facility's combustion of municipal waste affects ambient air quality, visibility, soils, vegetation, and other relevant factors. In that analysis, the source must consider the impacts of other industrial facilities near the site. New municipal waste incinerators must also develop a materials separation plan that addresses separation of certain municipal waste components to make such components available for recycling. The siting plans and the materials separation plans must be made available to the public for comment. Similarly, in September 1997, EPA issued emissions standards for medical waste incinerators under section 129 of the CAA. These standards require new sources to develop a siting analysis that considers air pollution control alternatives that minimize, on a site-specific basis and to the maximum extent practicable, potential risks to public health and the environment. EPA issued revisions to the medical waste incinerator standards in October 2009, but did not revise these siting requirements.

The emissions standards issued recently for sewage sludge incinerators and commercial and industrial solid waste incinerators also include siting requirements for new sources. Specifically, owners or operators of new sewage sludge incinerators are required to conduct a siting analysis, which includes submitting a report that evaluates site-specific air pollution control alternatives that minimize potential risks to public health or the environment, considering costs, energy impacts, non-air environmental impacts and any other factors related to the practicability of the alternatives. In conducting an analysis to meet the siting requirements of these recent rules as well as the rules issued earlier for municipal and medical waste incinerators, the owner or operator of the planned new source could consider environmental justice factors as part of the analysis of minimizing potential risks to public health, to the extent a particular

[10] *See* 40 C.F.R. Part 60, Subparts LLLL and MMMM.

demographic category is a population that is more vulnerable to the air pollution produced by the source. The regulatory text of the siting requirements does not currently require such consideration; however, EPA could consider revising the regulations to do so.

III. HAZARDOUS AIR POLLUTANT STANDARDS

A. List of Hazardous Air Pollutants

Section 112(b) of the CAA contains an initial list of hazardous air pollutants (HAPs) and states that EPA shall, "where appropriate," revise the list through rulemaking to add substances that "present, or may present . . . a threat of adverse human health effects . . . or adverse environmental effects."[11] Additions may be made in response to a petition or on the Agency's own initiative. EPA is required to add an air pollutant to the HAPs list if it determines, or if a petitioner shows, that "emissions, ambient concentrations, bioaccumulation or deposition of the substance are known to cause or may be reasonably anticipated to cause adverse effects to human health or adverse environmental effects."[12] In reaching such a determination, EPA could take into account environmental justice factors in its consideration of adverse human health effects to the extent a particular demographic category is a population that is more vulnerable to the air pollutant at issue.

B. MACT Standards

Under section 112 of the CAA, EPA is required to establish emissions standards for major sources of HAPs, requiring the maximum achievable degree of reduction in HAPs emissions. These standards are technology-based, and are calculated using the emission control achieved by the best performing sources. Therefore, EPA does not have discretion to consider public health impacts in setting the floor for the maximum achievable control technology (MACT) standards. However, EPA may choose to set a standard beyond the level achieved by the best performing sources (*i.e.*, beyond the floor), and when doing so can take into consideration under section 112(d)(2) any non-air quality health and environmental impacts resulting from such standards.

Section 112(d)(4) of the CAA provides that, for HAPs with an established health threshold, EPA may consider such health threshold when establishing emissions standards under section 112(d). This provision has historically been interpreted as allowing EPA to set emissions standards that are less stringent than the MACT floor, where a less stringent standard would ensure that the health threshold is not exceeded, with an ample margin of safety. The legislative history indicates that a health-based emissions limit under section 112(d)(4) should be set at the level at which no observable effects occur, and provide for an ample margin of safety. EPA has exercised this discretionary authority in the past to effectively exempt from the MACT requirement pollutants for which EPA concluded there was a health threshold.

Recently, EPA explained its interpretation of section 112(d)(4) in its proposed emissions standards for major source commercial, industrial, and institutional boilers and process heaters. In that notice, EPA did not propose a health-based standard for such boilers under section 112(d)(4), but explained that it interpreted this provision to allow the Administrator to consider

[11] CAA section 112(b)(2).

[12] CAA section 112(b)(3)(B).

factors other than the health threshold when establishing a health-based standard. Other factors include the potential for cumulative adverse health effects due to concurrent exposure to other HAPs with similar biological endpoints, from either the same or other source categories, where the concentration of the threshold pollutant emitted from the given source category is below the health threshold; the potential impacts on ecosystems of releases of the pollutant; and reductions in criteria pollutant emissions and other co-benefits that would be achieved via the MACT standard. These factors could be applied to consider impacts on overburdened communities, particularly in urban areas where there may be a large number of industrial sources of HAPs located close together.

C. GACT Standards

EPA has discretion to set emissions standards representing generally available control technology (GACT) for area sources (*i.e.*, sources that are not major sources), instead of MACT standards. The Senate report on the 1990 CAA Amendments describes GACT as "methods, practices, and techniques which are commercially available and appropriate for application by the sources in the category considering economic impacts and the technical capabilities of the firms to operate and maintain the emissions control systems."[13] Like MACT, GACT standards are technology-based and the CAA does not explicitly provide for consideration of public health risk in establishing the GACT standards. However, the CAA does not specify any criteria that EPA must consider when exercising its authority to promulgate GACT standards, as opposed to MACT standards, for an area source category or subcategory. The CAA therefore does not preclude EPA from considering non-technology factors, including impacts on minority, low-income, and indigenous populations, in choosing between MACT or GACT standards for individual area source categories or subcategories.

D. Regulation of Area Sources Based on an "Adverse Effects" Finding

Section 112(c)(3) of the CAA provides that EPA shall list each area source category or subcategory that the Administrator finds presents a threat of adverse effects to human health or the environment (by such sources individually or in the aggregate) warranting regulation under section 112. EPA must then issue section 112(d) emission standards for the listed category or subcategory. EPA has previously stated that it "believes that it has discretion to consider a range of health effect endpoints and exposure criteria in making [an adverse effect finding under section 112(c)(3)]" and that it "may consider factors such as the number of sources in a category, the quantity of emissions, the toxicity of the HAPs, the potential for individual and population exposures and risks, the geographical distribution of the sources and the reasonableness of control measures."[14] Although EPA is not aware of any previous section 112(c)(3) adverse effect finding that specifically considered environmental justice factors, the range of factors identified above could include consideration of potential adverse health effects to minority, low-income, and indigenous populations.

E. Residual Risk

Section 112(f) of the CAA requires EPA within eight years after promulgation of each technology-based emission standard for major sources under section 112(d) to review and revise

[13] S. Rep. No. 101-228 (1989).

[14] Proposed Rule: National Emission Standards for Hazardous Air Pollutants (NESHAP) (Secondary Lead Smelters), 59 Fed. Reg. 29750, 29754-29755 (June 9, 1994).

such standards, if necessary to protect public health with an ample margin of safety and to prevent adverse environmental effects, taking into consideration costs, energy, safety, and other relevant factors. In recent rulemakings, EPA has included an environmental justice analysis that provides information on the demographic impacts of proposed rules. If EPA determined that additional controls were necessary to protect public health with an ample margin of safety, EPA would promulgate regulations to provide such protection. In making such determinations, EPA can consider demographics where, for example, it determines that a particular demographic category is a population that is more vulnerable to the pollutants emitted by the source category at issue.

IV. NATIONAL AMBIENT AIR QUALITY STANDARDS (NAAQS)

Section 109(d) of the CAA provides that EPA periodically review and revise, as appropriate, the NAAQS, which are designed "to protect the public health" and the public welfare. In setting the NAAQS, EPA focuses on the health effects on population groups that are at higher risk of adverse health effects. Thus, the NAAQS inherently take certain environmental justice factors into account as part of the standard-setting process. The legislative history of section 109 indicates that a primary (health-based) standard is to be set at "the maximum permissible ambient air level . . . which will protect the health of any [sensitive] group of the population," and that for this purpose "reference should be made to a representative sample of persons comprising the sensitive group rather than to a single person in such a group."[15] This can include, for example, groups that are more susceptible to harm from a given exposure to a pollutant like ozone, such as persons with asthma or pre-existing respiratory conditions, or groups that are more exposed to the pollution, such as children's or outdoor workers' exposure to ozone, or exposure of children to lead.

Similarly, in establishing a monitoring network to support a NAAQS, EPA may use its discretion to site some monitors in locations to protect susceptible and vulnerable populations. For example, in the final rule on the Primary National Ambient Air Quality Standards for Nitrogen Dioxide, the Administrator required the Regional Administrators to use their discretionary authority to site a specific number (40) of monitors with a primary focus on susceptible and vulnerable populations, which include asthmatics and disproportionately exposed groups.[16] EPA determined that it was necessary and appropriate to site monitors in such locations to address the risk of increased exposure to these populations. It is important to recognize, however, that the consideration of at-risk populations is, as it must be, treated as part of EPA's statutory responsibility to protect public health, whether or not environmental justice is at issue.

[15] S. Rep. No. 91-1196, at 10 (1970); *see also Coalition of Battery-Recyclers Ass'n v. EPA*, 604 F.3d 613 (D.C. Cir. 2010) ("this court has held that 'NAAQS must protect not only average healthy individuals, but also "sensitive citizens"' such as children, and '[i]f a pollutant adversely affects the health of these sensitive individuals, EPA must strengthen the entire national standard.'" (quoting *Am. Lung Ass'n v. EPA*, 134 F.3d 388, 389 (D.C. Cir. 1998)).

V. MOBILE SOURCES

A. Fuel Controls or Prohibitions

Section 211(c) of the CAA provides that EPA may control or prohibit the manufacture or sale of any fuel or fuel additive that causes or contributes to air pollution that may reasonably be anticipated to endanger public health or welfare. As with other regulations implementing health-based standards, EPA can take into account impacts on sensitive populations. EPA used the predecessor of current section 211(c) to control the use of lead in gasoline to protect the public health, considering among other factors the impact of ambient lead and related blood-lead levels on children, including urban children and children living in substandard housing.[17] In the 1977 amendments to the CAA, Congress cited this example in support of its revisions to section 211(c) and various other CAA provisions. The current language on endangerment to public health or welfare in section 211(c) and other provisions is designed, among other things, "[t]o assure that the health of susceptible individuals, as well as healthy adults, will be encompassed in the term 'public health,'. . . ."[18]

B. Motor Vehicles and Nonroad Engines and Vehicles

Section 213(a) of the CAA provides for the regulation of emissions from new nonroad engines and vehicles that cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare. Similar language is found in section 202(a)(1). Again, EPA has the latitude to take into account impacts on sensitive populations.

NAAQS IMPLEMENTATION

I. GENERAL CONFORMITY DETERMINATIONS FOR FEDERAL AGENCY ACTIONS

General conformity requires federal agencies to demonstrate that the emissions from a federal action will conform to the purposes of the appropriate state, tribal or federal implementation plan for attaining clean air and will not otherwise cause or contribute to a violation of or interfere with the ability to attain and maintain the NAAQS. EPA could issue guidance to federal agencies recommending that environmental justice considerations such as impacts on minority, low-income, or indigenous populations be addressed in completing their general conformity determinations, although section 176(c)(1) of the CAA does not provide clear authority to rely specifically upon environmental justice factors to find that an activity does not conform. Such guidance could recommend that federal agencies address environmental justice factors regarding impacts on or participation by overburdened communities both in the process of finalizing those determinations (such as by allowing for extended public comment periods or having specific public meetings with affected communities to discuss the activity under consideration) and in the substance of those determinations (such as considering protection of overburdened communities when evaluating project mitigation options or selecting locations for acquiring offsets).

[17] *Ethyl v. EPA*, 541 F.2d 1, 40, 44, 47-48 (D.C. Cir. 1978).

[18] H.R. Rep. No. 95-294, at 50 (1977).

II. FEDERAL IMPLEMENTATION PLANS AND NEW PLANNING AFTER FAILURE TO ATTAIN THE NAAQS

Under section 110(c) of the CAA, EPA must promulgate a Federal Implementation Plan (FIP) for an area within two years of making a finding that a state has failed to submit a complete State Implementation Plan (SIP) or disapproving a submitted SIP. Where EPA takes such an action with regard to a broad planning SIP, such as an attainment demonstration or reasonable further progress plan, EPA could consider environmental justice factors in determining which sources to regulate in order to meet the goal of attainment or reasonable further progress.

Under section 179(d) of the CAA, if EPA determines that a state failed to attain the NAAQS by the applicable attainment date, EPA must require the state to submit a SIP revision including "such additional measures as the Administrator may reasonably prescribe, including all measures that can be feasibly implemented in the areas in light of technological achievability, costs, and any non-air quality and other air quality-related health and environmental impacts." EPA could consider environmental justice factors in determining whether to require regulation of particular sources of air pollution or require adoption of specific programs due to "non-air quality and other air quality-related health and environmental impacts."

In addition, consistent with the provisions of sections 301(a) and 301(d)(4) of the CAA, EPA promulgates FIP provisions as are necessary or appropriate to protect air quality in Indian country where tribal efforts do not result in adoption and approval of tribal plans or programs.[19] EPA has promulgated FIPs for Indian country at the national, regional, and source-specific levels.[20]

PERMITTING

I. NEW SOURCE REVIEW

New Source Review (NSR) is a preconstruction permitting program. If a new major source or a major modification to an existing major source will increase emissions by an amount large enough to trigger NSR requirements, then the source must obtain a permit before it can begin construction. The NSR provisions are set forth in sections 110(a)(2)(C), 165(a) (PSD permits), 172(c)(5) and 173 (NSR permits) of the Clean Air Act. Under the CAA, states have primary responsibility for issuing permits, and they can customize their NSR programs within the limits of EPA regulations. EPA's primary role is to approve state programs and to review, comment on, and take any other necessary actions on draft and final permits to assure consistency with EPA's rules, the state's implementation plan, and the CAA. Citizens also play a role in the permitting decision and must be afforded an opportunity to comment on each construction permit before it is issued. In addition, EPA directly issues permits in certain situations (*e.g.*, in states that have declined to fully

[19] *See* 63 Fed. Reg. 7254, 7265 (Feb.12, 1998); 40 C.F.R. § 49.11.

[20] *See*, *e.g.*, 76 Fed. Reg. 38748 (July 1, 2011) (New Source Review permitting rule for Indian country); 75 Fed. Reg. 10174 (March 5, 2010) (Source-Specific FIP for Navajo Generating Station, Navajo Nation); 70 Fed. Reg. 18074 (April 8, 2005) (FIPs for Indian Reservations in Idaho, Oregon and Washington).

implement an NSR program, in Indian country, and in Outer Continental Shelf areas) and, through the EPA Environmental Appeals Board, adjudicates appeals of EPA permits and permits issued by states and local districts with delegated federal programs.[21]

The NSR permit program for major sources has two different components – one for areas where the air is dirty or unhealthy, and the other for areas where the air meets health-based standards or is unclassified. Under the CAA, geographic areas (*e.g.*, counties or metropolitan statistical areas) are designated as "attainment" or "nonattainment" with the NAAQS – the air quality standards that are set to protect human health and the environment. Permits for sources located in attainment (or unclassifiable) areas are called Prevention of Significant Deterioration (PSD) permits and those for sources located in nonattainment areas are called nonattainment NSR permits.

The requirements of these permit programs are somewhat distinct. One notable difference in the two programs is that the control technology requirement in nonattainment areas is called the Lowest Achievable Emission Rate (LAER), which is defined as the most stringent emission limitation required under a state implementation plan or achieved in practice for a class of category of sources. In PSD areas, a source must apply Best Available Control Technology (BACT), and the statute allows the consideration of cost and other factors in weighing BACT options. Also, in keeping with the goal of progress toward attaining the NAAQS, sources in nonattainment areas must always provide or purchase "offsets" – decreases in emissions that compensate for the increases from the new source or modification. In PSD areas, offsets are not required, but sources must demonstrate that they will not cause or contribute to a violation of the NAAQS or the PSD increments, the latter of which are margins of "significant" air quality deterioration above a baseline concentration that establish an air quality ceiling, typically below the NAAQS, for each PSD area. Sources can typically make this demonstration based on the BACT level of control or by accepting tighter air quality-based limitations, but permitting authorities have the discretion to require mitigation measures in a PSD permit that are comparable to offsets if such measures are necessary to meet this "cause or contribute" standard.

EPA's opportunities to advance environmental justice in NSR and PSD permitting differ depending on whether EPA or the state is the permitting authority. When EPA is the permitting authority, the Agency controls both the content of the permit and the permit review process. Control over the review process gives EPA opportunities to enhance environmental justice by facilitating increased public participation in the formal permit consideration process (*e.g.*, by granting requests to extend public comment periods or hold multiple public meetings, or by providing translation services at hearings in areas with limited English proficiency). EPA can also take informal steps to enhance participation even earlier in the process, such as inviting community groups to meet with EPA and express their concerns before a draft permit is issued. And when EPA makes permit decisions, the Agency has sufficient legal authority to consider potential disproportionate environmental burdens on a case-by-case basis, with no need to amend existing regulations or guidance documents. In fact, EPA is already following this case-by-case approach in issuing PSD permits consistent with its legal authority.

[21] *See* 40 C.F.R. §§ 52.21(u) and 124.19.

When a state is the permitting authority, EPA's role includes commenting on individual permits during the comment period. This presents an opportunity for EPA to advance environmental justice by focusing the state's consideration on potential disproportionate environmental burdens in determining that the permits comply with applicable requirements. EPA can offer comments to states regarding disproportionate burdens arising from permits (although states would not necessarily need to accept and act on such comments). EPA routinely comments on proposed permits, but has not previously emphasized such issues in comments.

Another EPA role in state permitting is writing the regulations that establish the minimum criteria for PSD and NSR permitting programs implemented by state permitting authorities. EPA has promulgated the minimum requirements for an approvable state PSD permitting program in 40 C.F.R. § 51.166, and similar state program requirements for nonattainment NSR are contained in 40 C.F.R. § 51.165. At present, these rules do not explicitly discuss environmental justice considerations and thus do not directly require state permitting authorities to reflect these considerations in their permitting decisions. If EPA were to interpret the Clean Air Act to provide the Agency with the discretion to require more direct consideration of these factors in permitting decisions by EPA and the states, the Agency could consider revising the criteria applicable to state permitting programs in order to make environmental justice considerations more explicit in one or more aspects of the permitting criteria.

A. Nonattainment NSR Permitting Authority

Section 173(a)(5) of the CAA requires a permitting authority reviewing a nonattainment NSR permit to determine whether "an analysis of alternative sites, sizes, production processes, and environmental control techniques for such proposed source demonstrates that benefits of the proposed source significantly outweigh the environmental and social costs imposed as a result of its location, construction, or modification." Thus, this provision calls for consideration of siting issues.

Under the regulations at 40 C.F.R. § 51.161, state implementation plans must require the state or local permitting agency to provide an opportunity for public comment on information submitted by a source owner or operator who is seeking a nonattainment NSR permit. This opportunity must include the following: (1) a 30-day public comment period; (2) public availability of the information provided by the permit applicant (and the permitting authority's analysis of the effects of the proposed source seeking the permit), in at least one location in the affected area; and (3) a prominent advertisement of the availability of the information.

Implementation of the nonattainment NSR programs meeting these core requirements is primarily a state responsibility. In light of some differences in the statutory provisions applicable to the nonattainment NSR program and the PSD program, EPA has assumed responsibility for issuing nonattainment NSR permits less frequently than PSD permits. Given the primacy of state legal authority as the foundation for implementing this program, and the focus of this document principally on circumstances in which EPA is the implementing authority, further analysis of opportunities to incorporate environmental justice considerations into nonattainment NSR permitting decisions by states is beyond the scope of this exercise. However, further analysis of these issues may well be beneficial in the context of future undertakings.

B. PSD Program Permitting Authority and Implementation History

Section 165(a)(2) of the CAA provides that a PSD permit may be issued only after "a public hearing has been held with opportunity for interested persons including representatives of the Administrator to appear and submit written or oral presentations on the air quality impact of [the proposed] source, alternatives thereto, control technology requirements, and other appropriate considerations." Likewise, one purpose of the PSD program is "to assure that any decision to permit increased air pollution in any area to which this section applies is made only after careful evaluation of all the consequences of such a decision and after adequate procedural opportunities for informed public participation in the decisionmaking process."[22] In addition to requiring an opportunity for public participation in permitting decisions, the "alternatives" and "other appropriate considerations" language in section 165(a)(2) can be interpreted to provide the Agency with discretion to incorporate environmental justice considerations when issuing PSD permits. EPA has recognized that this language provides a potential statutory foundation in the Clean Air Act for this discretion.[23] However, EPA has never explicitly based a PSD permit condition solely on such discretion or section 165(a)(2) alone, and the full contours of such discretion have not yet been defined.

Nevertheless, section 165(a)(2) could be construed to provide EPA with discretion (but not a mandatory obligation) to impose permit conditions on the basis of environmental justice considerations raised in public comments regarding the air quality impacts of a proposed source. EPA has argued that this provision authorizes the incorporation of plant siting considerations into PSD permitting decisions. The ability to condition a permit due to environmental justice considerations would further the purpose of part C of title I of the Clean Air Act "to protect public health and welfare from any actual or potential adverse effect . . . from air pollution . . . notwithstanding the attainment and maintenance of all [NAAQS]."[24]

The EPA Environmental Appeals Board (EAB) first addressed environmental justice considerations under the CAA in 1993.[25] In its initial Order Denying Review in Part and Remanding in Part in *Genesee Power*, the EAB stated that the CAA did not allow for consideration of environmental justice and siting issues in air permitting decisions. In response, EPA's Office of General Counsel filed a Motion for Clarification on behalf of the Office of Air and Radiation and Region V. The Motion pointed out, among other things, that the CAA requirement to consider alternatives to the proposed source and the statutory definition of "best available control technology" provided opportunities for consideration of environmental justice in PSD permitting. The Motion also referenced legislative history that suggests Congress intended for the Clean Air Act to provide for examination of the air quality impact of particular site location decisions. In an amended opinion and order issued on October 22, 1993, the EAB deleted the controversial language but did not decide whether

[25] *In the Matter of Genesee Power Station*, PSD Appeal Nos. 93-1 through 93-7 (EAB Sept. 8, 1993).

it is permissible to address environmental justice considerations under the PSD program.[26] Thus, EPA has asserted arguments that support the authority to condition or deny PSD permits based on environmental justice, siting, or other considerations not explicitly addressed by other provisions in part C of title I of the Clean Air Act, but the Agency has never attempted to establish permit conditions based directly and exclusively on such authority.

Subsequently, based on Executive Order 12898 on environmental justice, the EAB has held that environmental justice considerations must be considered in connection with the issuance of federal PSD permits issued by EPA Regional Offices or states acting under delegations of federal authority.[27] In the *Knauf Fiber Glass* matter, the EAB remanded a PSD permit to the delegated permitting authority for failure to provide EPA's environmental justice analysis in the administrative record in response to comments raising the issue.[28] In these cases, the EAB did not specifically cite section 165(a)(2) or any other provision of the CAA as the basis for EPA discretion to consider environmental justice. But the EAB has recognized that consideration of the need for a facility is within the scope of section 165(a)(2) when a commenter raises the issue.[29]

Based on these EAB decisions, EPA Regional Offices or their delegates in the States routinely conduct an environmental justice analysis in conjunction with the review of PSD permit applications. Indeed, the EAB "has held that environmental justice must be considered in connection with the issuance of PSD permits," and "has . . . encouraged permit issuers to examine any 'superficially plausible' claim that a minority or low-income population may be disproportionately affected by a particular facility."[30] EPA guidance or EAB decisions do not call for integrating environmental justice considerations into any individual component of the PSD permitting review, such as the determination of BACT. Rather, the practice of EPA Regional Offices and delegated states has been to conduct a largely freestanding environmental justice analysis for PSD permits.

EPA has not issued any formal guidelines for the scope and content of an environmental justice analysis on PSD permits, but has developed some general parameters through individual actions. Such an analysis has generally involved an assessment of the impacts a source may have on minority or low-income communities, which is typically informed by the analysis of whether a source will cause or contribute to a violation of the health-based NAAQS in any area. The EAB has often deferred to the judgments of EPA

Regional Offices that the NAAQS provide a useful benchmark for assessing potential adverse impacts on the health of members of affected communities.[31]

However, in *In re Shell Gulf of Mexico, Inc.*, the EAB remanded an environmental justice analysis as inadequate when the record contained no document designated as an environmental justice analysis, and no "information or other evidence" that the analysis of environmental justice issues undertaken solely in response to public comments "considered anything beyond compliance with the NAAQS" in effect when the permit was issued.[32] The EAB considered this insufficient under the circumstances because, before the permit was issued, EPA had announced that it was revising the relevant NAAQS effective shortly after the permit was issued because the unrevised NAAQS was not adequately protective of public health.[33] In a later case, *In re Avenal Power Center, LLC,* the Board explained that its remand in the *Shell* case was because of "the region's scant environmental justice analysis, which provided no examination or analysis of [specified environmental justice] impacts *whatsoever*."[34]

In the *Avenal* case, the EAB rejected a challenge to a dedicated environmental justice analysis that "collected and analyzed demographic, health-related, and air quality data" regarding the impacts of emissions from a proposed facility.[35] The EAB noted that the Region made the environmental justice analysis available for public comment. The EAB recognized that "[t]he plain language of the Executive Order" allows agencies "considerable leeway . . . in determining how to comply with the letter and spirit of the Executive Order."[36] Thus, a "substantive environmental justice analysis that endeavors to include and analyze data that is germane to the environmental justice issue raised during the comment period" may comply with the Executive Order even if it does not reach a definitive conclusion if "the permit issuer demonstrates that it exercised its considered judgment when determining that it could not reach a determinative conclusion due to the insufficiency of available valid data."[37] The EAB further noted that petitioners bear a "particularly heavy burden [in] demonstrating that the Agency clearly erred in making its technical judgments" regarding what data to consider in an environmental justice analysis.[38]

Notwithstanding the lack of formal rules or guidance under the PSD program, in the decisions discussed above that postdate issuance of Executive Order 12898, the EAB

acknowledged that EPA can address environmental justice considerations in PSD permit reviews and evaluated the adequacy of EPA's environmental justice analyses as a matter of compliance with the Executive Order. Notably, the EAB has recognized that EPA has authority to use its discretion under PSD program regulations to establish permit conditions on the basis of environmental justice considerations:

> In support of environmental justice for this community, the Region took steps to require that many elements of the air quality analyses performed during the permit process be reconfirmed after the permit is issued. As conditions of the permit, [the permittee] is required to conduct ambient SO_2 monitoring and to perform a multi-source air quality analysis for SO_2. These permit conditions are a testament to the role of public participation in the permit process. Because of the concerns raised during the public comment period, this permit contains additional conditions that are not mandated by the PSD regulations but are within the Region's discretion to require. The Region incorporated the conditions into the permit as a tangible response to the community's concerns about air quality and to fulfill the goals of the Executive Order.[39]

The additional conditions in this instance involved post-construction monitoring requirements (discussed further below) that are within the discretion of the permitting authority to impose under express authority in EPA regulations.[40]

Under section 165(a)(7) of the CAA, one requirement of a PSD permit review is that a permit applicant "conduct such monitoring as may be necessary to determine the effect which emissions from any such facility may have, or is having, on air quality in any area which may be affected by emissions from such source." This provision and section 165(e)(2) have been applied by permitting authorities to require collection of pre-construction monitoring data on ambient air quality conditions in the area to inform the air quality analysis needed to determine whether the permit may issue. In practice, most permit applicants have not been required to collect new site-specific monitoring data but have been allowed to use previously collected data from another location that is shown to be representative of the area affected by the proposed construction. However, to support an environmental justice analysis, EPA could use this authority to gather site-specific data as appropriate to evaluate potential impacts on particular minority, low-income, and indigenous populations.

Moreover, EPA has interpreted section 165(a)(7) to provide a permitting authority with the discretion to require post-construction monitoring to determine the effect a source is actually having on air quality in any area.[41] Thus, a permitting authority has the discretion to require post-construction monitoring in a PSD permit to provide assurance that there will not be a disproportionate impact on air quality in a minority, low-income, or indigenous community. The EAB has affirmed the discretion of a permitting authority to establish post-construction

[39] *In re AES Puerto Rico, L.P.*, 8 E.A.D. at 351 (internal citations omitted).

[40] 40 C.F.R. § 52.21(m)(2).

[41] 40 C.F.R. §§ 51.166(m)(2) and 52.21(m)(2).

monitoring requirements on the basis of environmental justice considerations.[42] Such monitoring can verify the source's actual impact.

The role of environmental justice considerations in addressing hazardous air pollutant impacts in PSD permitting is not straightforward. In the 1990 CAA Amendments, Congress provided in section 112(b)(6) of the CAA that the PSD provisions do not apply to hazardous air pollutants (HAPs). Due to this provision, BACT limits are not required to be set for HAPs in PSD permits. However, the Administrator ruled prior to the 1990 Amendments that in establishing BACT for criteria pollutants (pollutants directly regulated under PSD), analysis of control technologies for criteria pollutants could also consider their relative ability to control emissions of pollutants *not* directly regulated under PSD.[43] In EPA's view, the 1990 Amendments did not change this limited authority, and it could be viewed as a basis for addressing environmental justice considerations derived from collateral impacts of air toxics emissions. In addition, EPA may have authority to take into account effects of HAPs that are also criteria pollutants, such as volatile organic compounds.

II. TITLE V

All major stationary sources of air pollution and certain other sources are required to apply for CAA title V operating permits that include emission limitations and other conditions as necessary to assure sources' compliance with applicable requirements of the CAA, including the requirements of the applicable implementation plan.[44] Unlike PSD/NSR permitting, the title V operating permit program does not generally impose new substantive air quality control requirements (which are referred to as "applicable requirements"), but does require permits to contain monitoring, recordkeeping, reporting, and other conditions to assure compliance by sources with applicable requirements.[45] One purpose of the title V program is to enable the source, EPA, states, and the public to better understand the applicable requirements to which the source is subject and whether the source is complying with those requirements. Thus, the title V operating permit program is a vehicle for ensuring that existing air quality control requirements are appropriately applied to facility emission units and that the units comply with these requirements.

Section 502(d)(1) of the CAA calls upon each state to develop and submit to EPA an operating permit program intended to meet the requirements of CAA title V. Under section 505(a) of the CAA and the relevant implementing regulations at 40 C.F.R. § 70.8(a), states and other permitting authorities are required to submit each proposed title V permit to EPA for review. Upon receipt of a proposed permit, EPA has 45 days to object to final issuance of the permit if it is determined not to be in compliance with applicable requirements or the requirements of title V.[46] If EPA does not object to a permit on its own initiative, section 505(b)(2) of the CAA provides that any person may petition the Administrator, within 60 days of

[43] *In re North County Resource Recovery Assoc.*, 2 E.A.D. 229, 230 (Adm'r 1986).

[44] CAA sections 502(a), 504(a), and 504(c).

[45] 57 Fed. Reg. 32250, 32251 (July 21, 1992) (EPA final action promulgating Part 70 rules).

[46] 40 C.F.R. § 70.8(c).

the expiration of EPA's 45-day review period, to object to the permit.[47] In response to such a petition, section 505(b)(2) of the CAA requires the Administrator to issue an objection if a petitioner demonstrates that a permit is not in compliance with the requirements of the CAA.

Because title V generally does not authorize the direct imposition of substantive emission control requirements, title V permitting does not appear to be an effective mechanism for establishing new, substantive control requirements to address environmental justice considerations regarding impacts on or participation by minority, low-income, or indigenous populations. The title V process, however, can allow public participation to serve as a motivating factor for applying closer scrutiny to a title V source's compliance with applicable CAA requirements. By providing significant public participation opportunities, title V can serve as a vehicle by which citizens can raise environmental justice considerations that arise under other provisions of the CAA. Communities can use the title V process to help ensure that each title V permit contains all of a source's applicable requirements, and other conditions necessary to assure the source's compliance with those requirements.

Under the 40 C.F.R. Part 70/71 permitting process, EPA has exercised its CAA authority to require extensive opportunities for public participation in permitting actions. For example, 40 C.F.R. § 70.7(h) requires that all permit proceedings (except for modifications qualifying for minor permit modification procedures) "provide adequate procedures for public notice including an opportunity for public comment and a hearing on the draft permit." This provision also specifies steps permitting authorities must take to allow for adequate public participation.

Under section 505(c) of the CAA, title V permits must contain provisions, including monitoring requirements, to assure compliance with permit terms and conditions. EPA has made clear in several recent title V orders responding to citizen petitions that permitting authorities need to evaluate monitoring requirements in title V permits, and must supplement monitoring in title V permits where necessary to assure compliance with permit terms and conditions. In the *CITGO* and *Premcor* Orders,[48] EPA summarized the title V monitoring requirements. EPA explained that the Part 70 monitoring rules[49] are designed to satisfy the statutory requirement in section 504(c) of the CAA that "[e]ach permit issued under [title V] shall set forth . . . monitoring . . . requirements to assure compliance with the permit terms and conditions."

As a general matter, permitting authorities must take three steps to satisfy the monitoring requirements in EPA's Part 70 regulations. First, under 40 C.F.R. § 70.6(a)(3)(i)(A), permitting authorities must ensure that monitoring requirements contained in applicable requirements are properly incorporated into the title V permit. Second, if the applicable requirement contains no periodic monitoring, permitting authorities must add "periodic monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit."[50] Third, if there is some periodic monitoring in the applicable requirement, but that monitoring is not sufficient to assure compliance with permit terms and conditions, permitting

[50] 40 C.F.R. § 70.6(a)(3)(i)(B).

authorities must require supplemental monitoring or perform such monitoring itself in order to assure such compliance.[51]

In addition, in all cases, the rationale for the selected monitoring requirements must be clear and documented in the permit record.[52] Further, permitting authorities have a responsibility to respond to significant comments.[53] This principle applies to significant comments on the adequacy of monitoring.[54]

Further, title V and EPA's implementing regulations also contain requirements regarding other types of conditions necessary to ensure compliance, such as reporting requirements. Section 504(c) of the CAA requires that each permit set forth "inspection, entry, monitoring, compliance certification, and reporting requirements to assure compliance with the permit terms and conditions." Further, 40 C.F.R. § 70.6(c)(1) requires that title V permits contain "compliance certification, testing, monitoring, reporting, and recordkeeping requirements sufficient to assure compliance with the permit terms and conditions." There are also several specific provisions in Part 70 addressing these other types of requirements, such as 40 C.F.R. § 70.6(a)(3)(ii) on recordkeeping.[55]

As the *CITGO* and *Premcor* Orders illustrate, EPA can use its role in overseeing and implementing the title V permitting process to help ensure that a title V permit contains all of the source's applicable requirements, and other conditions – including provisions for monitoring and recordkeeping – necessary to assure the source's compliance with those requirements. The process for public petitions to the Administrator on state-issued permits under section 505(b)(2) of the CAA and 40 C.F.R. § 70.8(d) allows an opportunity for the public to raise to EPA concerns regarding particular title V permits. In addition, EPA has authority to comment on whether a title V permit assures compliance with requirements of the CAA. Further, under CAA section 505(b), EPA must object if the Agency determines a permit is not in compliance with the requirements of the CAA.

As stated above, title V requires permitting authorities to submit proposed permits to EPA for a 45-day review period before the title V permits may be issued. EPA Regional Offices review only some of the proposed title V permits that are submitted by the permitting authorities because the resources available for such review and the statutory time frame provided for review of proposed permits are not sufficient to allow review of all proposed title V permits. In some instances, Regional Offices have prioritized title V permit review based on factors related to environmental justice. One way that EPA could address environmental justice considerations under title V more systematically would be for the Agency to direct its resources available for review of proposed title V permits to the review of such permits where they impact overburdened communities. Thorough EPA review would protect public health by potentially

[51] 40 C.F.R. § 70.6(c)(1).

[53] *See, e.g., In the Matter of Onyx Environmental Services*, Petition V-2005-1 (Feb. 1, 2006) ("it is a general principle of administrative law that an inherent component of any meaningful notice and opportunity for comment is a response by the regulatory authority to significant comments").

[54] *See, e.g., Premcor Order* at 7.

[55] *Premcor Order* at 8.

identifying any deficiencies with proposed permits and help ensure that the title V permits affecting these populations include all applicable requirements and adequate monitoring, recordkeeping, and reporting requirements to assure compliance with the applicable requirements.

Where EPA has not approved a state or tribal title V program (*e.g.*, in most of Indian country), EPA directly implements the title V permit program under 40 C.F.R. Part 71. In reviewing and acting on permit applications under Part 71 in Indian country and other areas, EPA can exercise the legal authorities discussed above to promote meaningful public involvement and ensure that title V permits contain adequate provisions to assure compliance with applicable requirements.

NATIVE AMERICAN COMMUNITIES AND FEDERALLY RECOGNIZED INDIAN TRIBES

As discussed in more detail in Chapter Five, Executive Order 12898 on environmental justice specifically addresses Native American communities and federally recognized Indian Tribes by providing that "[e]ach Federal agency responsibility set forth under this order shall apply equally to Native American programs."[56] In addition, the CAA provides opportunities for EPA to work with Indian tribes, and for EPA and tribes to consider and address impacts on Native American communities.

In 1998, EPA promulgated the Tribal Authority Rule (TAR), 40 C.F.R. Part 49, which implements the directive in section 301(d)(2) of the CAA that EPA promulgate regulations identifying the CAA provisions for which eligible tribes may be treated in the same manner as states. Under the TAR, an eligible tribe may be treated in the same manner as a state for all of the core CAA programs, including the establishment of implementation plans, the Prevention of Significant Deterioration program, and title V permitting programs. Many of these programs provide significant opportunities and responsibilities for tribes to work with affected communities in implementing the CAA. Tribes may also apply to EPA under CAA section 105 and the TAR for access to funds to implement tribal clean air programs for their areas. To date, 37 tribes have received treatment-as-a-state (TAS) status for various CAA provisions. Three of those tribes have EPA-approved tribal implementation plans (TIPs) to address air quality issues on their reservations, with several more TIPs under development, and one tribe has been approved to implement on EPA's behalf the federal title V operating permit program under 40 C.F.R. Part 71 for its reservation.

In addition, under section 164 of the CAA, states and Indian tribes have the authority to modify the classifications for their attainment areas, which will determine the level of significant deterioration allowable under the PSD increments. Several tribes have decided to provide their reservations the enhanced protection of air quality provided by Class I status and have obtained EPA approval to redesignate their reservations as Class I.

[56] Executive Order 12898, Section 6-606.

Further, EPA has authority under CAA section 301(d)(4) to directly implement provisions of the CAA in Indian country in the absence of EPA-approved programs.[57] When EPA undertakes direct implementation of the CAA in Indian country, EPA generally consults and works closely with the relevant tribal governments. EPA tribal programs are discussed more fully in Chapter Five.

MISCELLANEOUS

I. ACCIDENT PREVENTION AUTHORITIES

The Chemical Accident Prevention Provisions, 40 C.F.R. Part 68, implement CAA section 112(r)(7)(B). These rules require the preparation of risk management plans (RMPs) that summarize steps stationary sources take to prevent catastrophic toxic airborne releases, fires, and explosions. The RMPs include an assessment and disclosure of potential areas and populations that may be affected by worst-case accidents and other more likely events, as well as an accident history and a summary of accident prevention measures and emergency response programs. Portions of the RMPs could be made available to the public via an on-line database, although by statute EPA may not allow the general public access to certain off-site consequence information (*e.g.,* worst-case scenarios and more likely release scenarios) and rankings of facilities by scenario. During the rule's development, commenters asked for opportunities for local input into source prevention programs, including public meetings with sources during program development and the right to trigger audits or inspections. While the final rule does not provide for local input, EPA could amend its rules to create public input opportunities.

EPA has rulemaking authority under CAA section 112(r)(7)(A) to require additional monitoring and recordkeeping related to accidental release prevention, and to distinguish among sources by location. EPA has not exercised this authority. This authority applies to the same substance list as the rules under CAA section 112(r)(7)(B) discussed above and is similar to other CAA monitoring and recordkeeping authorities summarized in this document, except its focus is on accidental releases. Therefore, EPA has the authority to establish additional release monitoring requirements in overburdened communities if needed to prevent and address accidental releases.

In addition to the regulatory authority in CAA section 112(r)(7), the statute directly establishes a "general duty" to assess hazards, design and maintain a safe facility, and respond to accidents. This authority in CAA section 112(r)(1) is not limited to a set list of chemicals. Instead, it applies to any stationary source handling substances that are extremely hazardous due to use and properties. EPA has the authority to provide guidance on this duty.

II. RADIATION

EPA has examined the potential use of RCRA Subtitle C landfills for the risk-based disposal of radioactive waste containing low concentrations of radionuclides. These efforts are in the preliminary stages. However, environmental justice considerations regarding impacts on or

[57] *See also* 40 C.F.R. Part 49.

participation in decision-making by minority, low-income, and indigenous populations may arise in a manner similar to those under RCRA (siting of disposal facilities, monitoring, closure, land use). See Chapter Three.

III. INDOOR AIR POLLUTION

EPA has authority to do research and disseminate information concerning indoor air pollution pursuant to the Radon Gas and Indoor Air Quality Research Act of 1986.[58] EPA does not have regulatory authority to address indoor air pollution. In the past, EPA has addressed indoor air pollution such as second-hand smoke, otherwise known as "environmental tobacco smoke" (ETS), through means such as issuance of an ETS Risk Assessment and informational programs to advise the public about the risks of exposure to ETS. Such techniques could potentially be brought to bear with other indoor air pollutants that have disproportionate impacts on at-risk populations, potentially including minority, low-income, or indigenous populations.

IV. INFORMATION AUTHORITIES

EPA has a range of information-gathering and dissemination authorities that it can use to promote environmental justice. These authorities relating to research, monitoring and reporting can be implemented to focus attention on, and enhance participation in decision-making by, minority, low-income, and indigenous populations in ways that enable those populations to obtain information they can use to safeguard their health and environment.

As discussed above, EPA and state permitting agencies can impose monitoring requirements in individual permits. In addition, CAA section 114(a) authorizes certain record-keeping and reporting requirements, and section 114(c), in general, requires public availability of the information obtained pursuant to those requirements. EPA also has authority under CAA section 112(*l*)(3) to establish an air toxics clearinghouse to provide technical and other information about air toxics. EPA may also promulgate regulations under CAA section 112(r)(7) to impose monitoring, recordkeeping, reporting and other requirements in connection with the accidental release of regulated substances.

Further, under section 103 of the CAA, EPA has authority to conduct research relating to the causes, effects, extent, prevention, and control of air pollution. Clean Air Act section 112(*l*)(3) directs the Agency to use this authority to examine methods for preventing, measuring, and controlling emissions and evaluating associated health and ecological risks. Finally, CAA section 112(m) requires EPA to monitor the deposition of hazardous air pollutants onto the Great Lakes, the Chesapeake Bay, Lake Champlain, and coastal waters. EPA could focus that authority on collecting information relevant to the communities that depend on these water resources for fishing and other uses.

[58] 42 U.S.C. § 7401 note (1986).

CHAPTER TWO: WATER PROGRAMS

INTRODUCTION

This chapter addresses three statutes: the Clean Water Act,[59] the Safe Drinking Water Act,[60] and the Marine Protection, Research, and Sanctuaries Act.[61] The primary opportunities for advancing environmental justice exist under the Clean Water Act and Safe Drinking Water Act because they regulate a broad range of activities that could potentially affect minority, low-income, and indigenous communities that are or may be disproportionately impacted by environmental pollution. Under both of these statutes, EPA has discretionary authorities that could provide opportunities to advance environmental justice.

CLEAN WATER ACT

I. INTRODUCTION

The Clean Water Act (CWA) was adopted "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters."[62] To achieve this objective, Congress prohibited the discharge from a point source of any pollutant into a water of the United States unless that discharge complies with specific requirements of the CWA. In addition, Congress directed states to adopt water quality standards for their waters identifying the desired uses and acceptable levels of pollution in their waters. The CWA provides EPA broad authorities to establish regulations to implement the CWA's programs and gives EPA oversight authority of state programs. This chapter discusses the primary statutory and regulatory programs established under the CWA and identifies EPA's discretionary authorities to advance environmental justice under the CWA's various programs. The CWA's grant-related authorities and the oil spill program under section 311 are discussed separately in Chapters Seven and Three, respectively. Because states and authorized tribes[63] have primary responsibility to implement many of the CWA's regulatory programs, EPA may have limited authority to influence state and tribal decisions.

II. WATER QUALITY CRITERIA GUIDANCE AND WATER QUALITY STANDARDS

Water quality standards are the foundation of the water quality-based control programs mandated by the CWA. Water quality standards define the goals for a waterbody by designating

[59] 33 U.S.C. §§ 1251-1387.

[60] 42 U.S.C. §§ 300f -300j-26.

[61] 33 U.S.C. §§ 1401-1445.

[62] CWA section 101(a).

[63] As discussed in Section VII below and in Chapter Five, federally recognized Indian tribes may assume responsibility for administering many CWA programs under CWA section 518(e). However, eligible tribes are not required to do so. Currently, the water quality standards program is the only CWA regulatory program that is administered by some tribes.

its uses, setting criteria to protect those uses and establishing antidegradation protections to maintain existing uses and high water quality. Because water quality standards set the foundation for what level of water quality must be met by other CWA programs, they provide particular opportunities for ensuring protection of water quality in areas used by minority, low-income, and indigenous populations.

A. Water Quality Criteria Guidance

It is the national goal of the CWA that wherever attainable an interim goal of water quality that provides for the protection and propagation of fish, shellfish and wildlife and provides for recreation in and on the water be achieved.[64] Section 304(a)(1) of the CWA provides that EPA shall develop and publish criteria for water quality accurately reflecting the latest scientific knowledge on a variety of factors including "the kind and extent of all identifiable effects on health and welfare" that may be expected from the presence of pollutants in any body of water, including ground water. Pursuant to this authority, EPA has for 30 years developed and published water quality criteria guidance for protection of human health from consumption of fish and drinking water as well as exposure to bacteria through recreation in and on the water. States often adopt regulatory water quality standards pursuant to section 303(c) of the CWA based on EPA's recommended section 304(a) criteria.

(1) *EPA Authorities to Issue Recommended Criteria Guidance for Protection of Populations Consuming High Levels of Fish and Shellfish*

EPA's recommended water quality criteria generally are expressed as ambient numeric pollutant levels that EPA considers to be protective of the intended use of the water (*e.g.*, consumption of fish). EPA currently has recommended water quality criteria for protection of human health for over 100 individual pollutants. An important element of EPA's criteria recommendations for protection of human health is that they reflect EPA's assumptions regarding fish consumption. EPA's current recommended human health criteria reflect an assumption that the general population to be protected at the criteria level will consume 17.5 grams per day of fish (the national average value) and 100% of human exposure will be through surface water exposure pathways.

EPA's use of 17.5 grams per day reflects EPA's current methodology for deriving water quality criteria to protect human health, which EPA revised and published in 2000.[65] In the methodology, EPA "recommends a default fish intake rate of 17.5 grams/day to adequately protect the general population of fish consumers."[66]

For the protection of overburdened communities, EPA's methodology specifically considered "the States' and Tribes' need to provide adequate protection from adverse health effects to highly exposed populations such as recreational and subsistence fishers."[67] EPA recommends default fish consumption rates for recreational fishers and subsistence fishers of

[64] CWA section 101(a)(2).

[65] USEPA, Methodology for Deriving Ambient Water Quality Criteria for the Protection of Human Health (2000) (EPA-822-B-00-004 (October 2000)) at 4-25.

[66] *Id.*

[67] *Id.*

17.5 grams/day and 142.4 grams/day, respectively.[68] EPA's broad authorities under CWA sections 304(a)(1) and (2) would support the Agency's issuance of additional guidance to advance environmental justice if EPA determines that such guidance would help to protect populations consuming higher levels of fish and shellfish. Such guidance might provide additional recommended default consumption levels for a broader range of highly exposed populations beyond the current recommendations for recreational and subsistence fishers.

Recognizing that the level of fish intake in highly exposed populations varies by geographical location, EPA's methodology also suggests a four-preference hierarchy for states and authorized tribes to follow when deriving consumption rates. The four-preference hierarchy, which encourages use of the best local, state, and regional data available, consists of: (1) use of local data; (2) use of data reflecting similar geography/population groups; (3) use of data from national surveys; and (4) use of EPA's default intake rates.[69]

EPA has the opportunity and statutory authority when reviewing new or revised state and tribal water quality standards to ensure that states and tribes are appropriately considering all relevant data in determining if their water quality standards are providing adequate protection for highly exposed populations. For example, when one state adopted revised human health criteria for toxic pollutants in 2011, EPA evaluated the revised criteria to ensure that the state considered all available and relevant local and regional data respecting fish consumption rate. EPA determined that the revised criteria – which were based on a ten-fold increase in fish consumption patterns among tribal populations in the state – were derived in a manner consistent with EPA's recommended methodology for the protection of highly exposed populations. If the Agency determines that states and authorized tribes are not adequately considering available data or implementing EPA's four-preference hierarchy, EPA has broad statutory authority to issue additional guidance clarifying that the Agency expects them to address all fish consumption data in developing their water quality standards and to use default assumptions in the absence of local data. EPA could then use the guidance in its review of state and tribal water quality standards.

(2) *Authorities to Issue Guidance for Protection of Populations Swimming and Recreating in Waters of the United States, Including Urban Waters*

In 1986, EPA issued recommended water quality criteria guidance on the acceptable levels of indicators of fecal contamination in waters designated for primary contact recreation (*e.g.*, swimming). The Beaches Environmental Assessment and Coastal Health Act of 2000 (BEACH Act) amended the CWA to direct EPA to publish revised water quality criteria recommendations for protection of all coastal and Great Lakes waters designated for primary contact recreation.[70] EPA is required to publish its revised criteria recommendations in October 2012 pursuant to a consent decree. EPA has completed a research effort pursuant to CWA section 104(v) and the consent decree to develop the scientific support for the Agency's water quality criteria recommendations. In implementing its clear statutory authority to publish recommended criteria for protection of primary contact recreation uses, EPA will have the

[68] *Id.*

[69] *Id.*

[70] CWA section 304(a)(9).

opportunity to address what EPA believes to be the appropriate level of protection for people that swim in coastal and Great Lakes waters.

Although the BEACH Act amendments do not direct EPA to develop updated water quality criteria recommendations for waters other than coastal and Great Lakes waters, EPA has authority under CWA section 304(a) to update its 1986 recommendations for all inland waters. The knowledge gained through the research developed to support issuance of revised water quality criteria recommendations pursuant to the BEACH Act amendments could be considered in deciding whether to issue revised criteria for inland waters. The new data could help EPA to ensure that its recommendations for those waters are based on the best science available and reflect levels of risk the Agency currently believes appropriate. While updated water quality criteria recommendations could benefit all populations of swimmers, those populations would include communities in urban areas whose primary recreational opportunities may be in urban waters.

B. State or Tribal Water Quality Standards

The CWA requires states and authorized tribes to review their water quality standards every three years and submit the results of their reviews to EPA.[71] EPA must approve or disapprove all new or revised state or tribal water quality standards pursuant to section 303(c)(3). If EPA disapproves a state or tribal standard and the state or tribe does not revise its disapproved standard as necessary, EPA is required to promulgate a revised standard.[72] The Administrator is also required to promulgate a new or revised standard for a state or tribe whenever she determines that such a standard is necessary to meet the requirements of the CWA and the state or tribe does not act to adopt an appropriate standard.[73]

(1) *EPA Authorities for Providing Protection from Adverse Effects from Fish Consumption by Overburdened Populations*

EPA has issued guidance interpreting CWA section 101(a)(2) uses to include, at a minimum, uses providing for the protection of aquatic communities and human health related to consumption of fish and shellfish. In other words, EPA views "fishable" to mean not only that fish and shellfish can thrive in a water body, but also that, when caught, fish and shellfish can safely be eaten by humans.[74]

(a) Designated Fishing Uses

EPA regulations currently provide that all waters must be designated for the protection of aquatic life (which would include fishing), unless the state or tribe documents to EPA's satisfaction that such uses are not attainable.[75] Designated fishing uses generally do not specify

[71] CWA section 303(c)(1).

[72] CWA section 303(c)(4)(A).

[73] CWA section 303(c)(4)(B).

[74] Letter from Geoffrey H. Grubbs, Director, EPA Office of Science and Technology, and Robert H. Wayland, III, Director, EPA Office of Wetlands, Oceans and Watersheds (Oct. 24, 2000).

[75] 40 C.F.R. § 131.10(j).

the level of fish consumption to be protected. The level of fish consumption to be protected is generally identified by states and tribes in their adoption of water quality criteria.

(b) Water Quality Criteria to Protect Fishing Uses

As discussed above, EPA's guidance recommends that states and tribes, when adopting designated uses to protect fish consumption, adjust the fish consumption levels or values used to develop criteria to protect the "fishable" use, so that it will protect fish consumption by recreational and subsistence fishers. Protecting recreational and subsistence fishing can be an important element of advancing environmental justice where recreational and/or subsistence fishing is common among minority, low-income, and indigenous populations. Executive Order 12898 on environmental justice, Section 4-4, expressly addresses subsistence consumption of fish.

Under EPA's regulations, in reviewing state or tribal water quality standards, EPA would have the discretionary authority to consider all available information to determine if the state or tribal standards are adequately protecting overburdened communities. EPA Regional Offices could disapprove criteria adopted to protect designated fishing uses if EPA deemed the criteria insufficiently protective of highly exposed populations fishing, or expected to fish, in such waters. In the event EPA disapproves a state or tribal submission, EPA is authorized, and directed, to promulgate a new or revised standard for the state or tribe if the state or tribe does not adopt the necessary standard.

As early as 1995, EPA promulgated water quality criteria regulations for the Great Lakes based on protection of a population more highly exposed than the general population. EPA based its human health criteria on protecting consumption that "represents the mean consumption rate of regional fish caught and consumed by the Great Lakes sport fishing populations."[76] While that rulemaking did not address overburdened communities, it is an example of EPA's exercise of its authority to promulgate criteria to protect more highly exposed populations.

(2) *EPA Authorities for Providing Protection for Populations Recreating in Urban Waters*

Ensuring that urban waters are appropriately designated to protect recreational uses could be an important element in advancing environmental justice where recreational uses are common among minority, low-income, and indigenous populations in urban waters. In 2009, EPA exercised its CWA statutory authority to safeguard primary contact recreation uses for the Mississippi River, including segments of the river that flow past St. Louis, Missouri. EPA exercised its authority under CWA section 303(c)(4)(B) in determining that new or revised designated uses were necessary for those segments, because the state had failed to demonstrate that the primary contact recreation uses were not attainable. More recently, in May 2011, EPA exercised its CWA section 303(c)(4)(B) authority with respect to primary contact recreation uses for certain waters within the Chicago Area Waterways in Illinois. EPA could give high priority when reviewing state or tribal standards to ensuring that urban waters (or other waters where it is known that highly exposed populations may recreate) are designated for primary contact recreation unless the state or tribe has demonstrated such use is unattainable.

[76] 60 Fed. Reg. 15374 (Mar. 23, 1995).

(3) *CWA Authorities for Establishing Water Quality Standards in Indian Country*

EPA has considered opportunities for increasing protection of surface waters in Indian country in the context of establishing water quality standards under the CWA. To date, EPA and tribes primarily have used two CWA authorities to establish CWA water quality standards for Indian country surface waters: promulgation by EPA of federal standards for such waters, and approval by EPA of tribal standards submitted by authorized Indian tribes for reservation waters. For federal promulgation, EPA has authority under section 303(c)(4)(B) of the CWA to make a determination that Indian country waters need new or revised standards even in the absence of a tribal submission. EPA used this authority in 1989 to promulgate federal water quality standards for one reservation: the Colville Indian Reservation located in the State of Washington.[77] In 1998 and 2003, EPA considered promulgating federal water quality standards for Indian country surface waters where such waters did not have EPA-approved water quality standards. EPA never finalized such standards for a variety of reasons, including the resource-intensive nature of this type of rulemaking and the many competing perspectives encountered regarding the standards that were being considered. For example, some Indian tribes affirmed their interests in preserving their sovereign prerogatives over their waters.

EPA has continued to consider issues relating to promulgating federal water quality standards for Indian country waters. Based on EPA's experience, however, it has become clear that such efforts can be extremely resource intensive and may not ultimately be successful given significant existing constraints on Agency resources as well as the need to balance the many competing perspectives that are necessarily raised regarding tribal sovereignty as well as significant public policy and technical issues that often accompany rulemaking. Subject to availability of resources, EPA remains open to considering promulgation of federal standards at the request of individual tribes.

EPA believes that more promising opportunities exist to address the issue by enhancing the ability of tribes to seek authorization to establish water quality standards under the CWA for reservation waters. As described below in Section VII.A of this Chapter and also in Section II.B of Chapter Five, section 518(e) of the CWA authorizes EPA to treat eligible Indian tribes in a similar manner as states (TAS) for a variety of CWA programs, including establishing water quality standards. To date, 47 federally recognized tribes have obtained TAS eligibility for water quality standards, and 38 of those tribes have adopted standards that EPA has approved for the tribes' reservation waters. EPA believes that such direct tribal involvement is best suited to implementing tribal sovereign decision-making and most effectively ensures that tribal needs and uses of water are addressed in the CWA water quality standards program. Many tribes have found, however, that the TAS process can be challenging and time-consuming. To address this problem, in Section II.B of Chapter Five, EPA discusses several possible options to streamline the process to enhance the ability of tribes to obtain TAS status for the water quality standards program.

Ultimately, when considering legal tools under the CWA authorities referenced in this document that may affect tribal interests, EPA will first consult with tribal governments before

[77] 40 C.F.R. § 131.35.

any decisions are made, consistent with the *EPA Policy on Consultation and Coordination with Indian Tribes*, which is discussed in Chapter Five.

(4) *EPA Authorities to Promote Greater Public Participation*

Consistent with CWA section 101(e), EPA also has discretionary authority to encourage states to improve public participation processes in the development of state water quality standards through greater outreach, including to minority, low-income, and indigenous populations, and by translating crucial public documents and notices for limited English speaking populations consistent with Section 5-5(b) of Executive Order 12898 on environmental justice.

III. IDENTIFYING IMPAIRED WATERS AND ESTABLISHING TMDLS

Section 303(d) of the CWA requires states to identify waters not expected to meet water quality standards after implementation of existing pollution control requirements, and to establish total maximum daily loads (TMDLs) for such waters on a priority basis. TMDLs calculate the total pollutant load that can be introduced to a water body consistent with attainment of water quality standards, and allocates that load among known pollution sources. NPDES permits issued subsequent to TMDL development must include limitations consistent with the TMDL. EPA must approve or disapprove state lists and TMDLs and, if it disapproves, must establish lists and TMDLs for the states.[78] Some courts have held that EPA has a mandatory duty to establish TMDLs where states fail to act.

EPA has an obligation to ensure that states: (1) identify waters on section 303(d) lists that do not meet water quality standards; and (2) establish TMDLs for those waters. Section 303(d)(1)(A) of the CWA requires states to establish priority rankings that take into account the severity of the pollution and the uses to be made of the waters. States have broad discretion in prioritizing waters. Although EPA reviews state submissions to confirm that states have prioritized waters according to the statutory factors, the Agency does not approve the States' prioritizations.

EPA could examine the need to improve public participation in the section 303(d) process (*e.g.*, through greater outreach, including to minority, low-income, and indigenous populations, and by translating crucial public documents and notices for limited English speaking populations). EPA would have clear authority to carry out these actions when the Agency is providing for public participation.

EPA could also take impacts on minority, low-income, and indigenous populations into account in deciding how to allocate the waste load and load allocations when establishing TMDLs. EPA's long-standing position is that states (and EPA) have broad discretion in deciding how to assign allocations when establishing TMDLs. If pollutant loads would particularly affect overburdened communities, possibly because of significant exposures to other pollutants, it might be reasonable for EPA to exercise its discretion by reducing load allocations to sources that would directly impact those communities. It might also be possible for EPA to amend existing regulations to require consideration of impacts on overburdened communities in

[78] 40 C.F.R. § 130.7; *see* CWA section 303(d).

allocating loads. Because EPA's position has been that states and EPA have broad discretion in setting load allocations, promulgating regulations that would constrain such discretion and require consideration of impacts on overburdened communities would be a new and untested requirement.

IV. NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT PROGRAM

National Pollutant Discharge Elimination System (NPDES) permits are the primary way discharges of pollutants to waters of the United States are regulated. Currently, 46 states are authorized to issue NPDES permits, while EPA remains the permitting authority in four states, the District of Columbia, and U.S. territories. EPA is also the permitting authority on most tribal lands and for federal facilities in many states.

NPDES permits must contain: (1) technology-based limitations that reflect the pollution reduction achieved through particular equipment or process changes, without reference to the effect on the receiving water; and (2) where necessary, more stringent limitations representing that level of control necessary to ensure that the receiving waters achieve water quality standards. The Clean Water Act does not appear to provide any general authority to impose conditions on permits based on environmental justice considerations that are unconnected to water quality impacts or technology-based limitations. The CWA does, however, authorize the permit writer to impose monitoring, reporting, and recordkeeping requirements in permits as necessary to assure compliance with those permit limitations. Monitoring, reporting, and recordkeeping requirements can be useful tools to promote public understanding of the pollutant loadings discharged by the facility.

Environmental justice considerations could also be taken into account in setting permitting priorities and improving public participation in the permitting process. In addition, in implementing the NPDES statutory and regulatory authorities, EPA would have discretionary authority to take environmental justice considerations into account in the following ways:

- Provide technical assistance to Indian tribes on water pollution prevention programs, where appropriate (CWA section 104(a)).

- Conduct public investigations concerning pollution of any navigable waters and report on the results of such investigations (CWA section 104(a)(3)).

- Consider whether to include additional reporting requirements, such as requiring additional reports to be submitted to EPA where they can be made publicly available, to address environmental justice issues and focus attention on minority, low-income, and indigenous populations, where appropriate (CWA section 402(a)).

- Provide guidance to Regional Offices on how to consider environmental justice when conducting oversight of state NPDES programs. For example, provide guidance on changes to the Memorandums of Agreement between EPA and authorized states to ensure review of permits in overburdened communities.

- Consider cumulative impacts to impaired waters, focusing attention on waters affecting minority, low-income, and indigenous populations when new permits are proposed (CWA section 402(a)).

- Consider impacts on minority, low-income, and indigenous populations when deciding whether to object to a state-issued permit for failure to comply with the CWA (CWA section 402(d)).

- Where EPA issues permits, continually evaluate whether new information regarding human health impacts, especially among populations who are already overburdened, constitutes cause to modify permits.

- Focus attention on minority, low-income, and indigenous populations when determining whether to designate a small municipal separate storm sewer system for coverage under the NPDES storm water discharge program[79] or an animal feeding operation as a "significant contributor of pollution to the waters of the United States" and therefore a concentrated animal feeding operation.[80]

- Under CWA section 302, EPA is authorized to establish effluent limitations for one or more point sources if the applicable technology-based requirements will not assure protection of public health and other concerns. This determination requires findings of a reasonable relationship between costs and benefits. The Agency has never used this authority, but could evaluate whether this authority could be used with respect to pollutants of concern to minority, low-income, and indigenous populations. EPA could use its authority under CWA section 402(a)(1) to incorporate such limitations in specific NPDES permits issued by EPA.

An example of how environmental justice factors could be considered in the NPDES permitting program is the memorandum entitled "Improving EPA Review of Appalachian Surface Coal Mining Operations under the Clean Water Act, National Environmental Policy Act, and the Environmental Justice Executive Order" (Surface Coal Mining Memorandum).[81] That memorandum, which was issued on July 21, 2011, provides guidance regarding how to apply the current regulatory and statutory requirements of the NPDES permitting program to surface coal mining projects in Appalachia, an area of concern for the environmental justice community. The guidance is intended to enhance the consideration of environmental justice factors when EPA Regional Offices are conducting oversight of the authorized state NPDES programs.

V. STORM WATER PROGRAMS AND REQUIREMENTS

Heavy precipitation and wet weather can have a big impact on minority, low-income, and indigenous populations, especially in urban centers. Combined sewer overflows are discharges from combined sewer systems that are designed to collect rainwater runoff, domestic sewage, and industrial wastewater in the same pipe. They are subject to NPDES permit requirements,

[79] 40 C.F.R. § 123.35.

[80] CWA section 402; 40 C.F.R. § 122.23.

[81] The memorandum is available at http://water.epa.gov/lawsregs/guidance/wetlands/mining.cfm#memo20100401.

including both technology-based and water quality-based requirements of the CWA.[82] Sanitary Sewer Overflows (SSO) are discharges from sanitary sewer systems that collect and transport sewage that flows into a publicly owned treatment works (POTW). Sanitary Sewer Systems are part of the CWA definition of publicly owned treatment works and are therefore subject to secondary treatment requirements and more stringent limits as necessary to meet water quality standards.[83] Municipal separate storm sewer systems (MS4), regulated under CWA section 402(p), are conveyances or systems of conveyances that are: owned by a state, city, town, village, or other public entity that discharges to waters of the United States; designed or used to collect or convey storm water (including storm drains, pipes, ditches, etc.); and are neither a combined sewer nor part of a POTW (sewage treatment plant). MS4 permittees are required to reduce pollutants in storm water discharges "to the maximum extent practicable" under CWA section 402(p)(3)(B)(iii), which also provides authority for MS4s permits to require additional pollutant controls. In addition, CWA section 402(p)(6) authorizes EPA to identify additional storm water discharges and to regulate such discharges to protect water quality.

Storm water discharges from point sources are treated differently from other point source discharges under the CWA. In 1987, Congress amended the CWA to add CWA section 402(p). This provision, which is specific to point source storm water discharges, requires implementation of a comprehensive approach to addressing storm water. Among other things, section 402(p)(1) created a temporary moratorium on NPDES permits for point source storm water discharges, except for storm water discharges listed in section 402(p)(2). Section 402(p)(6) instructed EPA to subsequently designate additional point source storm water discharges for regulation under the statute. EPA implemented sections 402(p)(2) and (6) through what are known as the Phase I and Phase II storm water regulations.[84] Once EPA identifies a discharge under those sections as requiring a permit, the discharge can be subject to applicable technology-based and water quality-based effluent limitations.

EPA has authority under the CWA to establish new, more stringent storm water requirements and standards for urban areas, which may result in substantial improvements for minority, low-income, and indigenous populations. Such efforts could include controlling combined sewer overflows, infiltration and inflow into sanitary sewers, discharges from municipal separate storm sewer systems, and EPA's new effort to designate storm water discharges not yet designated for inclusion in the storm water program.

A. Combined Sewer Overflows (CSOs)

During periods of rainfall or snowmelt, wastewater volume in a combined sewer system can exceed the capacity of the sewer system or treatment plant. When this happens, the excess wastewater flows directly into nearby streams, rivers or other water bodies, potentially exceeding applicable water quality standards and exposing populations to raw sewage. CSOs can contain storm water, untreated human and industrial waste, toxic pollutants and debris. CSOs have been a cause of water quality impairment as documented in CWA section 305(b) reports, and may

[82] CWA sections 301(b)(1)(A), 301(b)(2)(A), and 402(p) and (q).

[83] CWA section 301(b)(1)(B).

[84] *See* 40 C.F.R. §§ 122.26 and 122.30-37; *see also* 64 Fed. Reg. 68722 (Dec. 8, 1999); 55 Fed. Reg. 47990 (Nov. 16, 1990).

occur in streams or rivers frequented by the public, thus representing a potential hazard to human health and the environment.

CSOs are subject to permitting under the CWA. EPA's 1994 CSO Control Policy specifies the technology-based and water quality-based effluent limits that should be included in NPDES permits for CSOs.[85] Congress subsequently added section 402(q) to the CWA, which provides in part that "each permit, order or decree issued pursuant to this chapter after December 21, 2000 for a discharge from a municipal combined storm and sanitary sewer shall conform to the Combined Sewer Overflow Policy signed by the Administrator on April 11, 1994." That policy specified that NPDES permitting authorities issue or reissue permits to require compliance with the technology-based and water quality-based requirements of the CWA. Technology-based requirements include implementation of "nine minimum controls." In addition, permittees are required to develop "Long Term Control Plans" in order to meet water quality standards. EPA expects a permittee's long-term control plan to give the highest priority to controlling overflows in sensitive areas. Sensitive areas include outstanding national resource waters, national marine sanctuaries, waters with threatened or endangered species or their habitat, waters with primary contact recreation, public drinking water intakes or their designated protection areas, and shellfish beds.[86] For such areas, the CSO Long Term Control Plan should prohibit new or significantly increased overflows, eliminate or relocate overflows wherever physically possible and economically achievable, and provide for treatment where necessary to meet applicable water quality standards.

There are approximately 836 permits in the United States for combined sewer systems. Affected communities are located in 32 states (including the District of Columbia), primarily concentrated in the Northeast and Midwest, and serve approximately 46 million people. EPA can bring additional focus to CSO-related issues in minority, low-income, and indigenous populations to advance environmental justice. EPA could evaluate existing Long Term Control Plans to see if they adequately address environmental justice considerations and seek modification of those Plans found to be lacking. Specifically, EPA could focus on whether the locations of overflows are causing water quality impairments that pose a particular risk to minority, low-income, and indigenous populations. This could be a significant resource issue for the Regional Offices and states. Further EPA could provide technical assistance where Long Term Control Plans are still being developed, with an eye toward environmental justice. Strengthening the oversight of the implementation of CSO controls could have a beneficial impact in urban population centers.

B. Sanitary Sewer Overflows (SSOs)

In 2010, EPA estimated that there are between 23,000 and 75,000 sanitary sewer overflow events per year. Of these, EPA estimated that 50% are caused by blockages and 25% are caused by wet weather infiltration or inflow into the pipes. EPA estimated that these overflows accounted for a total volume of between three and ten billion gallons of sanitary sewer wastewater discharged per year. They may overflow into areas that the public frequents, such as parks, beaches, backyards, city streets, and playgrounds.

[85] 59 Fed. Reg. 18688 (April 19, 1994).

[86] 59 Fed. Reg. at 18692.

Under the CWA, sanitary sewers are part of the definition of publicly owned treatment works. Therefore, they are subject to secondary treatment requirements and more stringent limits as necessary to meet applicable water quality standards. As such, overflows are generally prohibited. EPA and state NPDES inspectors assess collection systems and treatment plants to evaluate compliance with permit conditions, including proper operation and maintenance practices. These permit conditions are based on 40 C.F.R. § 122.41(e), which provides: "The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit."

Some suburban and exurban systems, called "satellite" systems, connect to urban systems but are generally not covered by the same permit. The unpermitted or separately permitted satellite systems may contribute large flows to urban systems or may be improperly operated or maintained. Yet they may not be co-permittees with the treatment plants and frequently do not bear a proportionate burden of the sewage treatment costs. In January 2005, EPA issued a "Guide for Evaluating Capacity, Management, Operation, and Maintenance (CMOM) Programs at Sanitary Sewer Collection Systems,"[87] which recommends practices for permittees and EPA and state inspectors to consider in assessing permit compliance or in writing settlement agreements. The guidance advises that satellite communities should not be allowed to contribute excessive flow to wastewater treatment plants, which are often located in financially stressed urban areas that may have an impact on minority, low-income, and indigenous urban populations.

In 2001, EPA proposed regulations codifying many of the suggested CMOM practices, including restrictions on satellite flow to sanitary sewer systems, but the rulemaking was never completed. Authority to regulate satellite flows into a sanitary sewer collection system can be predicated on the theory that either the satellite is itself discharging through the treatment works to a water of the United States or that the satellite and the downstream collection systems are both part of the POTW under the definition of "treatment works" in CWA section 212(2)(A) and, as such, certain effluent limitations could be placed on each entity that is part of the POTW. Pursuing a regulation to strengthen the requirements for satellite systems could be an important opportunity to level the playing field between suburban/exurban collections systems and communities and downstream urban communities. The regulation could potentially also address the problem of "basement backups," which may occur often in the homes of minority, low-income, and indigenous populations.

C. Municipal Separate Storm Sewer Systems (MS4s)

Section 402(p)(2)(C) and (D) of the CWA requires EPA to issue NPDES permits for storm water discharges from certain municipal separate storm sewer systems (MS4s). In plain terms, MS4s are discrete conveyances of storm water to waters of the United States. "Municipal separate storm sewer" means, among other things, "a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains) . . . [o]wned or operated by a . . . county. . . or other public

[87] The Guide is available at http://nepis.epa.gov/Exe/ZyPURL.cgi?Dockey=30006OW9.txt.

body (created by or pursuant to State law) . . . [and] [d]esigned or used for collecting or conveying storm water . . . ." [88]

EPA or states issue permits to regulated MS4s to control their discharges. Such permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."[89]

Under section 402(p)(3)(B)(iii), EPA can focus attention on minority, low-income, and indigenous populations in establishing more specific requirements for MS4 permits. For example, where an overburdened community uses a particular resource, such as engaging in subsistence fishing in urban waters, the permitting authority could impose requirements tailored to the need of that particular community.

D. Other Storm Water Point Source Discharges Not Yet Regulated

EPA has the legal authority under the CWA to regulate discharges of storm water from impervious surfaces or developed property based on the findings described in CWA section 402(p)(6).

Section 402(p)(6) provides:

> Not later than October 1, 1993, the Administrator, in consultation with State and local officials, shall issue regulations (based on the results of studies conducted under paragraph (5)) which designate stormwater discharges, other than those discharges described in paragraph (2), to be regulated to protect water quality and shall establish a comprehensive program to regulate such designated sources. The program shall, at a minimum, (A) establish priorities, (B) establish requirements for State stormwater management programs, and (C) establish expeditious deadlines. The program may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate.

EPA has broad discretion to identify discharges of storm water as requiring regulation under CWA section 402(p)(6). Under this provision, EPA can regulate long-term storm water discharges from development/impervious surfaces by making a finding that discharges from development/impervious surfaces warrant regulation in order "to protect water quality."

EPA also has broad discretion to determine how to control those designated discharges.[90] The last sentence of section 402(p)(6), which states that "[t]he program may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate[,]" gives EPA discretion to determine what kinds of program elements to establish. EPA has the authority to issue guidance or a rule that would be directly applicable to point

[88] 40 C.F.R. § 122.26(b)(8).

[89] CWA section 402(p)(3)(B)(iii).

[90] *See Envtl. Defense Ctr. v. EPA*, 344 F.3d 832, 844 (9th Cir. 2003); *see also Conservation Law Found. v. Hannaford Bros. Co.*, 327 F.Supp.2d 325, 330-32 (D. Vt. 2004), *aff'd*, 2005 WL 1712899 (2d Cir. 2005).

source discharges rather than be implemented through NPDES permits. Also, the express reference to "establishing priorities" in section 402(p)(6) gives EPA a basis to decide what discharges are most important to regulate, and it may decide not to address all discharges at one time. EPA could use the broad discretion that section 402(p)(6) provides to advance environmental justice in taking actions under section 402(p)(6).

Under CWA section 402(p)(2)(E), EPA has authority to designate through informal adjudication additional point sources of storm water discharges to be regulated under the NPDES program. EPA has implemented this "residual designation" authority in regulations at 40 C.F.R. §§ 122.26(a)(9)(C) and (D). These regulations provide that the permitting authority or the Regional Administrator may designate and require operators of storm water discharges or a category of discharges to obtain a permit if the authority determines that the discharge or category of discharges contributes to a water quality standards violation or is a significant contributor of pollutants to waters of the United States. Alternatively, a designation may be based on finding that storm water controls are needed for the discharge based on waste load allocations that are part of a TMDL that address the pollutants of concern.

EPA could choose to make greater use of its residual designation authority in affected areas to advance environmental justice. For example, in an overburdened community, EPA could decide that currently unregulated sources of storm water, *e.g.*, parking lots or impervious surfaces over a certain size, would be designated for regulation under the NPDES permit program. This could result in such facilities needing to make changes in order to better control their storm water. These controls could result in healthier urban streams, thereby providing benefits not only to the ecosystem itself, but also to the surrounding communities. Storm water controls yield the additional benefit of transforming gray urban environments into more inviting green spaces, enhancing recreational opportunities and enhancing quality of life.

Like the residual designation authority described in the preceding paragraphs, EPA has authority to designate an animal feeding operation (AFO) as a "concentrated animal feeding operation" (CAFO) requiring an NPDES permit. A CAFO is a "point source" under section 502(14) of the CWA. EPA regulations at 40 C.F.R. § 122.23(c) authorize the State Director or Regional Administrator in some circumstances to designate a CAFO upon a determination that it is a significant contributor of pollutants to waters of the United States. The regulations list factors to be considered in designating CAFOs, including "[o]ther relevant factors."[91] Although EPA has not yet exercised its CAFO designation authority to a significant extent, EPA could increase designations and consider potential impacts on minority, low-income, and indigenous populations as a "relevant factor." Such designation currently requires an onsite inspection and, if the AFO contains fewer than a specified number of animals, a determination that pollutants are discharged to waters of the United States through a manmade ditch, flushing system, or other similar manmade device or that pollutants are discharged directly into waters of the United States that originate outside the facility and pass over, across or through the facility or otherwise come into contact with the animals confined in the operation.[92]

[91] 40 C.F.R. § 122.23(c)(2)(v).

[92] 40 C.F.R. § 122.23(c)(3).

VI. SECTION 404 WETLANDS PROGRAM

Section 404 permits authorize the discharge of "dredged or fill material" to waters of the United States. The types of activities regulated under section 404 include filling of wetlands to create dry land for development, construction of berms or dams to create water impoundments and discharges of material dredged from waterways to maintain or improve navigation. Section 404 permits issued by the U.S. Army Corps of Engineers must satisfy two sets of standards: the Corps' "public interest review" and the CWA section 404(b)(1) guidelines promulgated by EPA. The public interest review is a balancing test that requires the Corps to consider a number of factors, including economics, fish and wildlife values, safety, food and fiber production and, in general, the needs and welfare of the people.[93] The section 404(b)(1) guidelines provide that no permit shall issue if: (1) there are practicable, environmentally less damaging alternatives; (2) the discharge would violate water quality standards or jeopardize threatened or endangered species; (3) the discharge would cause significant degradation to the aquatic ecosystem; or (4) if all reasonable steps have not been taken to avoid or minimize adverse effects of the discharge.[94] The 2011 Surface Coal Mining Memorandum provides the following guidance to the relevant Regional Administrators:

> [W]e recommend that Regions work collaboratively with the Corps to analyze the potential for disproportionately high and adverse human health or environmental effects on low-income and minority populations, including impacts to water supplies and fisheries, from issuance of a permit for surface coal mining activities in waters of the U.S. . . . .[95]

The broadest potential authority to consider environmental justice in the CWA section 404 program rests with the U.S. Army Corps of Engineers, which conducts a broad "public interest review" in determining whether to issue a section 404 permit. In evaluating the "probable impacts of the proposed activity and its intended use on the public interest," the Corps is authorized to consider, among other things, aesthetics, general environmental concerns, safety, and the needs and welfare of the people.[96] This public interest review could include environmental justice considerations. As part of the permit-issuance process, EPA may comment on and encourage the U.S. Army Corps of Engineers to consider cultural, social subsistence, "way of life," historic values and cumulative impacts when conducting public interest review.[97]

EPA has discretionary oversight authority over the Corps' administration of the section 404 program (*i.e.*, EPA comments on permit applications, can elevate regional Corps permit decisions to the Washington, D.C. level, and can "veto" Corps permit decisions under section 404(c) that would have "an unacceptable adverse effect on municipal water supplies, shellfish beds and fishery areas (including spawning and breeding areas), wildlife, or recreational areas."

---

[93] 33 C.F.R. § 320.4(a).

[94] 40 C.F.R. § 230.10.

[95] Surface Coal Mining Memorandum at 39. See, *supra*, Section IV of this Chapter.

[96] 33 C.F.R. § 320.4(a).

[97] 33 C.F.R. § 320.4(a)(1).

EPA can use these authorities in response to potential degradation of these public resources (*e.g.*, recreational or fishing areas that are important to at-risk populations) from impacts of surface coal mining in Appalachia that may have an adverse health or environmental effect on a minority, low-income, or indigenous population. Such impacts can be addressed when they result directly from a discharge of dredged or fill material (*e.g.*, the filling of a water body), or are a secondary effect of the permitted activity (*e.g.*, the fill will allow construction of an industrial facility that will cause water pollution due to runoff). EPA can raise these concerns when sending Agency comments during the Corps' public comment period and can include consideration of these issues when exercising the discretion to "veto" under section 404(c). EPA has used this authority to completion 12 times and has discussed environmental justice considerations in some of its final 404(c) determinations.[98]

EPA also may consider environmental justice relating to aquatic ecosystem degradation when determining whether to exercise veto authority or object to state-issued permits under CWA section 404(j).

VII. AUTHORIZATION OF TRIBAL PROGRAMS

A. Treatment in the Same Manner as States

Section 518 of the CWA and its implementing regulations provide that EPA may treat eligible Indian tribes in the same manner as states for purposes of many programs under the Clean Water Act, including for grants, adoption of water quality standards, issuance of water quality certifications and issuance of CWA section 402 and 404 permits. EPA has issued regulations implementing the treatment-as-a-state (TAS) provisions in section 518(e) and has granted applicant tribes TAS status for various programs under the CWA. Notably, a number of tribes have TAS status for purposes of CWA grants under section 106 and for water quality standards and certifications under sections 303(c) and 401 of the CWA. Currently, 47 tribes have TAS status for the water quality standards program and 38 of those tribes have EPA-approved water quality standards for their reservation waters.

EPA's implementation of TAS statutory authority over the past 20 years and its support of the adoption of environmental protections on Indian lands have allowed the Agency to advance environmental justice. As discussed in Chapter Five, EPA is exploring other ways to encourage and support tribal applications for TAS and adoption of tribal water quality standards for reservation waters.

B. Grants to Alaska to Improve Sanitation in Rural and Native Villages

CWA section 113 authorizes EPA to enter into agreements with the State of Alaska to carry out demonstration projects for the provision of safe water and elimination of pollution in native villages in Alaska. EPA tribal programs are discussed more fully in Chapter Five and tribal grants programs are discussed in Chapter Seven.

[98] *See, e.g.*, Final Determination of the Assistant Administrator for Water Pursuant to Section 404(c) of the Clean Water Act Concerning the Proposed Yazoo Backwater Area Pumps Project in Issaquena County, MS, September 19, 2008.

VIII. TOXIC POLLUTANT EFFLUENT STANDARDS AND PROHIBITIONS

Section 307(a)(2) of the CWA authorizes the Administrator to propose and promulgate an effluent standard or prohibition for a toxic pollutant applicable to a class or category of point sources taking into account a number of factors about the pollutant, including its toxicity, persistence, degradability, and potential presence in aquatic organisms. The Agency last used this authority in 1979. Pursuant to CWA section 307(a)(4), EPA promulgated effluent standards and prohibitions following "formal" rulemaking on the record. Promulgated effluent standards and prohibitions exist for six classes of toxic pollutants including pesticides and polychlorinated biphenyls (PCBs).[99] For example, the effluent standards and prohibitions for pesticides generally apply to manufacturers and formulators of the named pesticides and set either stringent allowable effluent discharge standards or prohibitions on discharge.

Section 307(a) of the CWA differs from the Agency's technology-based effluent limitations guidelines because it does not require that the Agency consider technological feasibility, cost or economic impact in setting effluent standards or prohibitions (although the Agency did consider such factors during the 1970's hearings). The onerous requirement that section 307(a) standards and prohibitions be promulgated through "formal" rulemaking (essentially a trial with cross-examination of expert witnesses) led the Agency to abandon the use of section 307(a) and instead simply promulgate effluent limitations guidelines pursuant to CWA sections 301 and 304. The burdens associated with formal rulemaking would continue to exist if the Agency chose to pursue use of section 307(a). The Agency, however, could explore whether the discretionary authorities in section 307(a) might be uniquely appropriate for addressing concerns about environmental protection of minority, low-income, and indigenous populations.

IX. SEWAGE SLUDGE

Section 405 of the CWA establishes the framework for sewage sludge management and disposal. The regulations are found at 40 C.F.R. Part 503. EPA issued standards for sewage sludge in 1993 that apply to ten metals and one pathogen (salmonella) and indicators of fecal contamination. The standards also specify requirements for biosolids land application, incineration and surface disposal.

EPA conducts biennial reviews of the standards as required by the CWA. EPA staff have identified additional work that may be appropriate for biosolids, including working on analytical methods for emerging contaminants found in biosolids, evaluating the risk assessment for biosolids and improving the Agency's understanding of treatment effectiveness. EPA could consider whether the current risk assessment, based on a sensitive child's exposure, is a sufficient surrogate for exposure of the members of overburdened communities.

X. RESEARCH, INVESTIGATIONS, TRAINING AND INFORMATION

The CWA provides broad authority for EPA to gather data, conduct research, and provide technical and grant assistance that could be used to advance environmental justice by focusing attention on, and promoting participation in, environmental decision-making by minority, low-income, and indigenous populations. Among these authorities are: (1) section 104(b) – collect and disseminate information on chemical, physical and biological effects of varying water

[99] *See* 40 C.F.R. Part 129.

quality and other information pertaining to pollution and the prevention, reduction and elimination thereof; (2) section 104(*1*) – collect and disseminate scientific knowledge on effects and control of pesticides in water; (3) section 104(p) – study and research methods of preventing, reducing, or eliminating pollution from agriculture; and (4) section 104(q) – research and investigation of methods of preventing, reducing, storing, collecting, treating or otherwise eliminating pollution from sewage in rural areas

An example of how EPA has used these authorities in recent years is EPA's issuance of fish consumption advisories pursuant to the authorities in section 104(b). Using the authorities in CWA section 104(b), EPA collected information on pollutant levels in both surface water and fish tissue, and issued information regarding risks associated with consumption of certain fish species. EPA has discretionary authority to consider environmental justice when deciding whether and what type of fish consumption advisories to issue in the future.

SAFE DRINKING WATER ACT

The Safe Drinking Water Act (SDWA) includes two separate regulatory programs. The public water supply (PWS) program establishes requirements for the quality of drinking water supplied by public water systems. This program establishes federal requirements that are directly implemented by EPA and approved states or tribes; there is no federal permit requirement. The underground injection control (UIC) program establishes controls on the underground injection of fluids in order to protect underground sources of drinking water. This program is implemented through permits (including permits by rule) issued by EPA or approved states or tribes.[100] The following section analyzes how EPA may address environmental justice considerations under both of these programs.

I. PUBLIC WATER SUPPLY PROGRAM

Under the SDWA PWS program, the Administrator is to establish national primary drinking water regulations that set either maximum levels or treatment requirements for contaminants that may occur in public water systems and have adverse effects on public health. The SDWA applies only to public water systems, defined in the SDWA as systems providing water through constructed conveyances to at least 15 service connections or regularly serving at least 25 individuals. The PWS program does not apply to systems smaller than the criteria above. Upon application of states and eligible tribes, the Administrator may authorize them to administer the PWS program. All but one state have authority (or "primacy") to administer the program. EPA administers the program in that state and in the District of Columbia. In addition, one tribe has primacy. EPA administers the program in all other situations.

[100] Like the CWA, the SDWA allows federally recognized Indian tribes to assume responsibility for administering SDWA regulatory programs. Specifically, under section 300j-11 of the SDWA, eligible tribes may administer both the PWS and UIC programs, as discussed further in Chapter Five.

A. Unregulated Contaminant Monitoring Rules

The Agency issues a new unregulated contaminant rule every five years with a new list of up to 30 contaminants.[101] This rulemaking provides crucial information for EPA's decision whether to regulate new contaminants. EPA can use this authority to gather information that may help to identify possible environmental justice considerations associated with currently unregulated contaminants, including those that may pose a special risk to minority, low-income, or indigenous populations.

B. Public Notification/Consumer Confidence Reports

The Agency is implementing public notification regulations and other right-to-know provisions of the SDWA, which were amended to ensure greater public notice of noncompliance problems and which already require notices in plain English and other relevant languages. EPA could consider updating these rules or provide guidance on these requirements to promote more aggressive outreach to these populations, particularly those with limited English proficiency.

C. Lead Rules

EPA promulgated a stringent rule for controlling lead in drinking water, and has updated this rule multiple times, including amendments made in 2007 to address concerns arising from exposure to lead in drinking water in the District of Columbia. Through continued implementation of this rule, and the next phase of revisions EPA is considering to the rule, EPA can help address the health concerns of minority, low-income, or indigenous populations exposed to high lead levels. In addition, EPA can provide outreach concerning the newly amended definition of "lead-free" in the SDWA to promote lowered levels of lead in consumer plumbing fixtures. [102]

D. Ground Water Rule

In 2006, EPA promulgated the Ground Water Rule to provide for increased protection against microbial pathogens in public water systems that use ground water sources, which are typically smaller and/or more rural water systems.[103] EPA did so in accordance with the SDWA as amended, which requires EPA to promulgate National Primary Drinking Water Regulations requiring disinfection as a treatment technique for all public water systems, including surface water systems and, as necessary, ground water systems. In the Ground Water Rule, EPA established a risk-targeted approach to target ground water systems that are susceptible to fecal contamination to take corrective action to reduce cases of illnesses and deaths due to exposure to microbial pathogens. EPA could evaluate how implementation of the Ground Water Rule has impacted overburdened communities, and consider changes or additional guidance accordingly.

E. Operator Certification and Capacity Development

EPA has authority to revise operator certification guidelines. Such revisions could be designed to enhance the development of better drinking water operator training programs for systems serving overburdened communities. EPA could also review state capacity development

[101] SDWA section 1445(a)(2).

[102] SDWA sections 1412 and 1417.

[103] The rule, which was published at 71 Fed. Reg. 65574 (Nov. 8, 2006) and amended by 71 Fed. Reg. 67427 (Nov. 21, 2006), is codified at 40 C.F.R. Part 141, Subpart S.

strategies to focus additional attention on improving the technical, managerial and financial capacity of small water systems.[104]

II. UNDERGROUND INJECTION CONTROL (UIC) PROGRAM

Under the Underground Injection Control (UIC) program, there may be opportunities to protect drinking water for minority, low-income, and indigenous populations through permit conditions, scrutiny of aquifer exemptions, and revisions to rules and guidance.

Under the UIC program, the Administrator must establish requirements for state UIC programs that will prevent the endangerment of drinking water sources by underground injection. EPA has promulgated a series of such requirements beginning in 1980. The SDWA also provides that states and eligible tribes may apply to EPA for primary enforcement responsibility ("primacy") to administer the UIC program. EPA must establish a UIC program in states that do not seek this responsibility or fail to meet the minimum requirements established by EPA. EPA also generally implements the program in Indian country since only two tribes currently have primacy for the program.

A. Permitting

Underground injection must be authorized by permit or rule. Where EPA issues a permit, it may include conditions to protect drinking water for minority, low-income, and indigenous populations. The SDWA provides that EPA can deny permits or establish permit limits where such injection may "endanger" public health. "Endangerment" is defined to include any injection that may result in the presence of a contaminant in a drinking water supply that "may . . . adversely affect the health of persons."[105] As a result, in those states, territories, and federal lands where EPA issues UIC permits, EPA may establish any necessary permit requirements under 40 C.F.R. § 144.52 when EPA finds that injection activity may result in drinking water supply contamination that may adversely affect the health of persons, including minority, low-income, and indigenous populations. Based on its analysis of the effect of Executive Order 12898, the Environmental Appeals Board (EAB) has considered the scope of EPA's authority to address environmental justice in the UIC permitting program.[106] Notably, in the *Envotech, L.P.* decision, the EAB recognized that under the UIC permitting program EPA may expand public participation and exercise its discretion under the SDWA to "impose on a case-by-case basis, permit conditions 'necessary to prevent the migration of fluids into underground sources of drinking water'" in order to protect underground sources of drinking water "upon which the minority or low-income community may rely."[107]

EPA may impose permit conditions on a case-by-case basis to ensure that proposed injection wells do not threaten the drinking water of minority, low-income, and indigenous populations. EPA's authority applies in all cases, "regardless of the composition of the

[104] SDWA sections 1419 and 1420.

[105] SDWA section 1421(d).

[106] *See generally In re Envotech, L.P.*, 6 E.A.D. 260, 278-82 (EAB 1996) (citing *In re Chemical Waste Management of Indiana*, 6 E.A.D. 66 (EAB 1995) and the similar permitting processes in RCRA and the SDWA).

[107] *Id. at 281* (citing 40 C.F.R. §144.52(a)(9)).

community surrounding the proposed injection site."[108] Nevertheless, in response to an environmental justice concern, the EAB has stated EPA may and "should, as a matter of policy, exercise its discretion under 40 C.F.R. § 144.52(a)(9) to include within its assessment of the proposed well an analysis focusing particularly on the minority or low-income community whose drinking water is alleged to be threatened."[109]

B. Aquifer Exemptions

EPA rules allow states to affirmatively exclude certain aquifers from UIC protection, where the aquifer has no real potential to be used as a drinking water source (*e.g.*, because of the high level of solids content).[110] In evaluating aquifer exemption requests from states (where states have primacy) or permit applicants (where EPA has primacy), EPA may be able to consider environmental justice issues. Public notice must be provided before EPA approves an aquifer exemption request. EPA could consider the importance of promoting meaningful participation in decision-making by minority, low-income, and indigenous populations in determining whether the public notice was adequate to reach them. In addition, EPA could consider implications for minority, low-income, and indigenous populations when determining whether the aquifer exemption request meets the criteria for exempted aquifers in 40 C.F.R. § 146.4, *e.g.*, whether there has been an adequate investigation as to whether the aquifer is currently serving as a source for drinking water for overburdened communities.

C. Regulatory and Guidance Revisions

EPA could revise the current regulations and guidance for all types of UIC wells to ensure focused attention on minority, low-income, and indigenous populations with regard to potential endangerment of drinking water supplies by injection. For example, EPA could review its regulations and guidance to determine whether changes to its regulations are necessary to address mountaintop mining risks to underground sources of drinking water, in response to allegations that such operations result in discharges of mining effluent into injection wells that may be contaminating groundwater.

III. SOURCE WATER PROTECTION PROGRAMS

Section 1424(e) of the SDWA allows EPA to determine that an area has an aquifer which is the sole or principal drinking water source for the area and would create a significant health hazard if contaminated. Once EPA has made this determination and provided notice of it, no commitment for federal financial assistance may be entered into for any project EPA determines might contaminate the designated aquifer through a discharge zone so as to create a significant hazard to public health. Under this authority, EPA could solicit participation in identification, designation, and protection of sole source aquifers. EPA could use this authority to identify and protect aquifers that serve overburdened communities.

---

[108] *Id.*

[109] *Id.* at 282.

[110] 40 C.F.R. § 144.1(g).

IV. RESEARCH, REPORTING, INFORMATION GATHERING, TECHNICAL ASSISTANCE

The SDWA gives EPA authority to perform activities in the following areas:

- Research (SDWA section 1442(a)): Research and investigate concerns for minority, low-income, and indigenous populations.

- Research (SDWA section 1458): Conduct a continuing program of studies to identify groups "that may be at greater risk than the general population of adverse health effects from exposure to contaminants in drinking water," focusing attention on minority, low-income, and indigenous populations where they face greater risks.

- Monitoring (SDWA section 1445(g)): Establish and maintain a database of the occurrences of regulated and unregulated contaminants in public water systems in a manner that is widely accessible and easy to use by minority, low-income, and indigenous populations.

- Technical Assistance (SDWA section 1442(a)): Provide technical assistance to public water systems, including those serving minority, low-income, and indigenous populations.

MARINE PROTECTION, RESEARCH, AND SANCTUARIES ACT

The Marine Protection, Research, and Sanctuaries Act (MPRSA), commonly known as the Ocean Dumping Act, establishes a permitting program that covers the dumping of material into ocean waters. The ocean disposal of sewage sludge and industrial waste is expressly prohibited.

EPA administers permits for the dumping of all material other than dredged material, which is permitted by the U.S. Army Corps of Engineers subject to EPA review and concurrence. When issuing MPRSA permits, EPA is to determine whether the proposed dumping will "unreasonably degrade or endanger human health, welfare, or amenities, or the marine environment, ecological systems, or economic potentialities."[111] EPA also is charged with designating sites at which permitted disposal may take place; these sites are to be located wherever feasible beyond the edge of the Outer Continental Shelf.

In considering permit applications and designating ocean dumping sites, EPA is authorized to take into account a variety of factors, including "[t]he effect of such dumping on human health and welfare, including economic . . . values," and, as such, could take into account the potential for disproportionate impacts on minority, low-income, and indigenous populations (particularly those that include subsistence consumers of sea food) from the proposed

[111] MPRSA section 102(a).

dumping.[112] In addition, the MPRSA provides specifically that EPA is to consider land-based alternatives to ocean dumping and the probable impact of requiring use of these alternatives "upon considerations affecting the public interest."[113] EPA could take impacts on these populations into account in evaluating alternative locations and methods of disposal of the material that is proposed to be dumped at sea. Ocean dumping permits also designate and include "such other matters as the Administrator . . . deems appropriate," which may include environmental justice considerations.[114]

[113] MPRSA section 102(a)(G).

[114] MPRSA section 104(a)(6).

CHAPTER THREE: SOLID WASTE AND EMERGENCY RESPONSE PROGRAMS

INTRODUCTION

This chapter discusses the Resource Conservation and Recovery Act,[115] the Emergency Planning and Community Right-to-Know Act,[116] and the Comprehensive Environmental Response, Compensation, and Liability Act,[117] As explained below, these statutes provide EPA various legal authorities to address environmental justice considerations.

RESOURCE CONSERVATION AND RECOVERY ACT

I. GENERAL AUTHORITY FOR ADDRESSING ENVIRONMENTAL JUSTICE – HAZARDOUS WASTE MANAGEMENT

The Resource Conservation and Recovery Act (RCRA) authorizes EPA to regulate the generation, transportation, treatment, storage, and disposal of hazardous wastes. RCRA requires EPA to promulgate regulations establishing such standards, applicable to generators, transporters, and owners and operators of hazardous waste treatment, storage, and disposal facilities "as may be necessary to protect human health and the environment."[118] RCRA section 7004(b) requires EPA to provide for "public participation in the development, revision, implementation, and enforcement of any regulation, guideline, information, or program." EPA may use these authorities to advance the fair treatment and meaningful participation of minority, low-income, and indigenous populations in the development of regulations, standards, and guidelines for hazardous waste management.

II. PERMITTING OF HAZARDOUS WASTE TREATMENT, STORAGE AND DISPOSAL FACILITIES

A. Omnibus Authority – RCRA Section 3005(c)(3)

The primary area of RCRA where environmental justice considerations have surfaced is in the permitting of hazardous waste treatment, storage, and disposal facilities (*e.g.*, incinerators, fuel blenders, and landfills). Pursuant to RCRA section 3005, EPA issues permits to such facilities if they demonstrate compliance with EPA regulations. Upon application by a state, EPA may authorize a state's hazardous waste program to operate in lieu of the federal program,[119] and to issue permits. The "omnibus" authority in RCRA section 3005(c)(3) provides

[115] 42 U.S.C. §§ 6901-6992k.

[116] 42 U.S.C. §§ 11001-11050.

[117] 42 U.S.C. §§ 9601- 9675.

[118] *See* RCRA sections 3002(a) (standards applicable to generators), 3003(a) (standards applicable to transporters), and 3004(a) (standards applicable to owners and operators of hazardous waste treatment, storage and disposal facilities).

[119] The state's program must be equivalent to the federal program to obtain and retain authorization. When EPA adopts more stringent RCRA regulations (including permit requirements), authorized states are required to revise

that "[e]ach permit issued under this section shall contain such terms and conditions as the Administrator (or the State) determines necessary to protect human health and the environment."

The scope of EPA's authority to address environmental justice issues in RCRA hazardous waste permits was directly addressed by the Environmental Appeals Board (EAB) in 1995.[120] In the *Chemical Waste Management* decision, the EAB found that within the RCRA permitting scheme EPA has significant discretion to implement the environmental justice mandates of Executive Order 12898 through public participation mechanisms and the "omnibus" authority.[121] In the area of public participation, the EAB made three relevant findings. First, it recognized that public comments can affect a permitting decision if they relate to issues about compliance with RCRA's statutory or regulatory requirements or otherwise relate to protection of human health and the environment.[122] Second, the EAB reaffirmed that EPA can provide opportunities for public involvement in the permitting process beyond those required by 40 C.F.R. Part 124.[123] Third, it held "that when the Region has a basis to believe that operation of the facility may have a disproportionate impact on a minority or low-income segment of the affected community, the Region should, as a matter of policy, exercise its discretion to assure early and ongoing opportunities for public involvement in the permitting process."[124]

The EAB also examined the breadth of EPA's discretion to promote environmental justice under the "omnibus" authority. As stated by the EAB, the clause authorizes permit conditions or denial as follows:

> Under the omnibus clause, if the operation of a facility would have an adverse impact on the health or environment of the surrounding community, the Agency would be required to include permit terms or conditions that would ensure that such impacts do not occur. Moreover, if the nature of the facility and its proximity to neighboring populations would make it impossible to craft a set of permit terms that would protect the health and environment of such populations, the Agency would have the authority to deny the permit. *See In re Marine Shale Processors, Inc.*, 5 E.A.D. 751, 796 n.64 (EAB 1995) ("[T]he Agency has traditionally read [section 3005(c)(3)] as authorizing denials of permits where the Agency can craft no set of permit conditions or terms that will ensure protection of human health and the environment."). In that event, the facility would have to

---

their programs within one year after the change in the federal program or within two years if the change will necessitate a state statutory amendment. 40 C.F.R. § 271.21(e).

Normally, state programs do not apply in Indian country unless a state seeks to have its program apply in Indian country within the state borders and EPA has made a finding that the state has the requisite authority for such program applicability. Therefore, responsibility for ensuring protection of human health and the environment in Indian country under the provisions of RCRA typically falls to EPA.

[120] *See In re Chemical Waste Management of Indiana, Inc.*, 6 E.A.D. 66 (EAB 1995).

[121] *Id*. at 73-74.

[122] *Id*. at 73.

[123] *Id*.

[124] *Id*. at 73-74.

> shut down entirely. Thus, under the omnibus clause, if the operation of a facility truly poses a threat to the health or environment of a low-income or minority community, the omnibus clause would require the Region to include in the permit whatever terms and conditions are necessary to prevent such impacts. This would be true even without a finding of disparate impact.[125]

The EAB also found that RCRA allows the Agency to "tak[e] a more refined look at its health and environmental impacts assessment, in light of allegations that operation of the facility would have a disproportionately adverse effect on the health or environment of low-income or minority populations."[126] The EAB noted that "a broad analysis might mask the effects of the facility on a disparately affected minority or low-income segment of the community" whereas a close evaluation could, in turn, justify permit conditions or denials based on disproportionately high and adverse human health or environmental effects.[127] However, while acknowledging the relevance of disparities in health and environmental impacts, the EAB also cautioned that "'there is no legal basis for rejecting a RCRA permit application based solely upon alleged social or economic impacts upon the community.'"[128]

Thus, the "omnibus" authority of RCRA section 3005(c)(3) may allow EPA to address cumulative risks due to exposure from pollution sources beyond the applicant facility in areas that may be disproportionately burdened. EPA may also use the "omnibus" authority where appropriate to craft permit conditions addressing unique exposure pathways and scenarios (*e.g.*, subsistence fishers or farming communities) or sensitive populations with pre-existing vulnerabilities at a particular hazardous waste management facility. EPA could also consider factors such as cumulative risk, unique exposure pathways, or sensitive populations in establishing priorities for the permit and corrective action programs.[129]

B. Contingency Plans

RCRA-permitted facilities are required under RCRA section 3004(a) to maintain "contingency plans for effective action to minimize unanticipated damage from any treatment, storage or disposal of . . . hazardous waste." Under this provision, EPA has the authority to require facilities to prepare and/or modify their contingency plans to reflect the needs of proximate minority, low-income, or indigenous populations that have limited resources to prepare for or respond to emergency situations. For example, contingency plans may need to account for the cumulative impacts of multiple facilities on local communities or pre-existing vulnerabilities in specific populations.

---

[125] *Id*. at 74.

[126] *Id*.

[127] *Id*. at 74-75.

[128] *Id*. at 73 (citation omitted).

[129] The statutory authority for EPA's corrective action programs is found in RCRA sections 3004(u), 3004(v), and 3008(h).

C. Public Participation

RCRA section 7004(b)(2) established public participation requirements for RCRA permitting. In 1995, EPA promulgated the "RCRA Expanded Public Participation" rule.[130] As a part of this rule, certain facilities "must hold at least one meeting with the public in order to solicit questions from the community and inform the community of proposed hazardous waste management activities."[131] RCRA is sufficiently flexible to allow for further exploration of whether the public participation process for RCRA permits could be expanded to allow for more meaningful participation by minority, low-income, and indigenous populations, including at hazardous waste management facilities to be located in or near their communities. In this regard, EPA also would have authority under RCRA to expand the application of those procedures to the permitting of: (a) publicly owned treatment works, which are regulated under the Clean Water Act; (b) underground injection wells, which are regulated under the Safe Drinking Water Act; and (c) ocean disposal barges or vessels, which are regulated under the Marine Protection, Research, and Sanctuaries Act, discussed more fully in Chapter Two. These facilities are subject to RCRA's permit-by-rule regulations[132] and are deemed to have a RCRA permit if they meet certain conditions set out in those regulations.

D. Review of State Permits

EPA's authority to review state-issued RCRA permits may also provide opportunities for consideration of environmental justice factors. EPA could provide comments on these factors (in appropriate cases) during the comment period on the state's proposed permit on a facility-by-facility basis, particularly where state law includes an analog to the RCRA "omnibus" authority.[133] If a state does not have "omnibus" authority analogous to RCRA section 3005(c)(3), EPA may address any necessary additional conditions under the "omnibus" authority in any federal portion of the RCRA permit. These conditions become part of the facility's RCRA permit.

E. Monitoring, Analysis and Testing

EPA may require a permittee or an applicant to submit information in order to establish permit conditions necessary to protect human health and the environment.[134] RCRA section 3013(a) provides that if the Administrator determines that "the presence of any hazardous waste at a facility or site at which hazardous waste is, or has been, stored, treated, or disposed of, or the release of any such waste from such facility or site may present a substantial hazard to human health or the environment," EPA may order a facility owner or operator to conduct reasonable monitoring, testing, analysis, and reporting to ascertain the nature and extent of such hazard. In appropriate circumstances, EPA could use its authority under section 3013 or 40 C.F.R. § 270.10(k) to compel a facility owner or operator to carry out necessary studies or risk assessments, so that, pursuant to the "omnibus" authority, EPA can establish permit terms or conditions as part of the permit application process as necessary to protect human health and the

[130] 60 Fed. Reg. 63417 (Dec. 11, 1995); 40 C.F.R. Part 124, Subpart B.

[131] 40 C.F.R. § 124.31(b).

[132] 40 C.F.R. § 270.60.

[133] 40 C.F.R. § 271.19(a).

[134] 40 C.F.R. § 270.10(k).

environment and reduce the potential for disproportionate impacts on overburdened communities.

RCRA section 3019 provides EPA with authority to require applicants for land disposal permits to provide exposure information and to request that the Agency for Toxic Substances and Disease Registry conduct health assessments at such land disposal facilities. This authority could be used to enhance the availability of information relating to areas with substantial minority, low-income, or indigenous populations.

F. Facility Siting Standards

Another example of where EPA might incorporate environmental justice considerations is under RCRA section 3004(o)(7). This section provides EPA with authority to issue location standards for hazardous waste treatment, storage, and disposal facilities as necessary to protect human health and the environment. Using this authority, EPA could, for example, revise the location standards to establish minimum buffer zones around hazardous waste management facilities to minimize clustering of schools, residential areas, and other community activities around such facilities.[135] Facilities would need to comply with these requirements to receive a permit.

III. HAZARDOUS WASTE REGULATION

RCRA authorizes EPA to promulgate regulations applicable to facilities that manage hazardous waste "as may be necessary to protect human health and the environment."[136] Consistent with the EAB's decision in *Chemical Waste Management*, RCRA's regulatory standard allows EPA to take a "refined look" at the risks posed by the management of hazardous waste to ensure that RCRA regulations are fashioned in a manner that does not "have a disproportionately adverse effect on the health or environment of low-income or minority populations."[137]

This regulatory latitude may have meaning not only with respect to permitting regulations, but also to regulations that determine whether materials are hazardous wastes. For example, in determining whether materials are solid wastes and, therefore, subject to regulation, EPA needs to determine whether materials are "discarded."[138] EPA issued a Definition of Solid Waste rule on October 28, 2008,[139] in which it established a number of conditions under which material would not be considered discarded and, therefore, not a solid waste.

---

[135] Local zoning and planning regulations may also be a significant factor in facility siting decisions.

[136] RCRA sections 3002(a), 3003(a), and 3004(a).

[137] *In re Chemical Waste Management of Indiana, Inc.*, 6 E.A.D. at 74.

[138] RCRA defines the term "solid waste" to mean "any garbage, refuse, sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility and other discarded material, including solid, liquid, semisolid, or contained gaseous material resulting from industrial, commercial, mining, and agricultural operations, and from community activities . . . . " RCRA section 1004(27). Courts have held that under this definition the ordinary plain-English meaning of the term "discard" controls. *See American Mining Congress v. EPA*, 824 F.2d 1177 (D.C. Cir. 1987). The ordinary plain-English meaning of the term "discarded" means "disposed of," "thrown away," or "abandoned."

[139] 73 Fed. Reg. 64668 (Oct. 28, 2008).

On July 22, 2011, in response to an administrative petition to amend or repeal this rule, EPA proposed further revisions to the definition of solid waste.[140] This proposal included an expanded environmental justice analysis, which identified gaps in the 2008 Definition of Solid Waste final rule that could result in risk to human health and the environment from discarded material, including the potential for disproportionate impacts to minority and low-income populations. The July 2011 proposal requested comment on revisions to the 2008 final rule that could increase environmental protection, including in minority and low-income populations, while still appropriately defining when a hazardous secondary material being reclaimed is a solid waste and subject to hazardous waste regulation.

IV. INDIAN COUNTRY

It is long-standing Agency policy that, absent Congressional intent to the contrary, the Nation's environmental laws are meant to apply equally nationwide. The Agency interprets this nationwide consistency to mean that, where there is no EPA-approved program in Indian country, EPA implements the relevant environmental program there. States generally lack authority to implement federal environmental laws in Indian country. Although other environmental statutes provide for Indian tribes to implement their provisions in a manner similar to states, RCRA lacks such a provision.[141] Thus, EPA implements the RCRA Subtitle C and I programs in Indian country.

V. UNDERGROUND STORAGE TANKS

Subtitle I of RCRA provides EPA with authority to regulate underground storage tanks (USTs) containing regulated substances, as defined in RCRA section 9001(2). RCRA section 9003 authorizes UST regulations "necessary to protect human health and the environment." It also allows the use of the Leaking Underground Storage Tank Trust Fund (the LUST Trust Fund) to undertake certain corrective actions with respect to releases of petroleum from USTs. There are three corrective action programs in this area. First, there is a regulatory program (including corrective action) in 40 C.F.R. Part 280 that applies to both petroleum and hazardous substance USTs. States can be authorized to operate a program that is no less stringent than the federal program. Second, the LUST Trust Fund can be used for some cleanups for releases from petroleum USTs.[142] Third, corrective action orders can be issued pursuant to RCRA section 9003(h)(4) covering USTs containing regulated substances. States operating pursuant to a cooperative agreement can utilize the federal authorities for the latter two categories.[143] EPA, and states operating pursuant to cooperative agreements, "shall give priority in undertaking corrective actions . . . and in issuing orders requiring owners or operators to undertake such actions, to releases of petroleum from underground storage tanks which pose the greatest threat to human health and the environment."[144]

---

[140] 76 Fed. Reg. 44094 (July 22, 2011).

[141] *Backcountry Against Dumps v. EPA*, 100 F.3d 147 (D.C. Cir. 1996).

[142] RCRA section 9003(h)(2).

[143] RCRA section 9003(h)(7).

[144] RCRA section 9003(h)(3).

In evaluating releases from USTs in disproportionately impacted minority, low-income, or indigenous communities for possible response actions, EPA or the state can take into account such things as unique exposure pathways and scenarios and sensitive populations in determining whether the release in question is among those which pose the greatest threat to human health and the environment.

VI. GENERAL AUTHORITY FOR ADDRESSING ENVIRONMENTAL JUSTICE – STATE SOLID WASTE MANAGEMENT PLANS

Under RCRA Subtitle D,[145] states are the primary implementing authority for managing nonhazardous solid waste. EPA issues guidelines and recommendations to state solid waste permitting programs under RCRA sections 1008(a), 4002, and 4004. RCRA section 1008(a) expressly provides that solid waste management guidelines shall describe levels of performance that provide "protection of public health and welfare" and shall include, where appropriate, consideration of "demographic" factors. Guidelines for state solid waste management plans developed under RCRA section 4002(c) may include consideration of factors such as "population density, distribution, and projected growth" and the "political, economic, organizational, financial, and management problems affecting comprehensive solid waste management." These provisions give EPA the legal authority to address environmental justice considerations in the development of regulations, standards, and guidelines for solid waste management. EPA could, for example, develop guidelines that encourage states to consider demographic and socio-economic factors such as the density and distribution of minority, low-income, and indigenous populations, as well as disproportionate burdens on minority, low-income, or indigenous populations when siting new solid waste management facilities.

RCRA section 7004(b) requires EPA and the States to provide for, encourage and assist in "public participation in the development, revision, implementation, and enforcement of any regulation, guideline, information, or program." EPA promulgated the "RCRA Expanded Public Participation" rule on December 11, 1995.[146] While these regulations describe the public participation process for RCRA permitting, EPA has the authority to promulgate similar regulations or issue guidelines for states to provide meaningful participation by minority, low-income, and indigenous populations in the development of solid waste management guidelines and plans and in the implementation of state solid waste programs.

EMERGENCY PLANNING AND COMMUNITY RIGHT-TO-KNOW ACT

Section 303 of the Emergency Planning and Community Right-to-Know Act (EPCRA) requires local emergency planning committees to prepare emergency response plans for facilities that contain certain amounts of designated extremely hazardous substances. The national response team could publish guidance under Section 303(f) on considering environmental justice issues in preparing and implementing emergency plans.

[145] RCRA sections 4001-4010.

[146] 60 Fed. Reg. 63417 (Dec. 11, 1995); 40 C.F.R. Part 124, Subpart B.

For a discussion of EPCRA section 313 and of the role of Indian tribes under EPCRA, see Chapters Four and Five, respectively.

SUPERFUND

I. GENERAL AUTHORITY FOR ADDRESSING ENVIRONMENTAL JUSTICE

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly referred to as Superfund, authorizes the federal government to respond to releases and threats of releases into the environment of hazardous substances or pollutants or contaminants. EPA does so by taking response measures, generally consistent with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP),[147] deemed "necessary to protect the public health or welfare or the environment."[148] EPA's authority to take actions "necessary to protect the public health or welfare or the environment" authorizes EPA to ensure fair treatment and meaningful participation in environmental decision-making for minority, low-income, and indigenous populations that are disproportionately impacted. For instance, EPA's authority to consider "public health or welfare or the environment" could be the basis for considering cumulative risk in taking response actions. [149] However, all response activities must generally be consistent with the NCP.

Impacts on minority, low-income, and indigenous populations could be considered a factor in setting clean-up priorities among non-National Priorities List (NPL) sites. EPA could implement a policy to prioritize sites where these populations have disproportionate environmental burdens. This can be done at non-NPL sites without rulemaking, as there is currently no defined system of "priorities" for non-NPL sites. EPA may simply choose to study and/or clean up any contaminated non-NPL sites, focusing on environmental justice considerations to the extent it finds appropriate.

Finding this same flexibility would be very difficult for NPL sites. NPL sites are listed mainly by application of the hazard ranking system (HRS), which uses exclusively numerical inputs to rank sites. The challenge is to quantify environmental justice considerations in a manner that is usable under the existing HRS ranking scheme. For example, to date EPA has not been able to quantify tribal considerations so as to use them under the HRS.

However, in assessing remedial alternatives, EPA considers nine factors, many of which (including "overall protectiveness of human health and the environment" and "community acceptance") can accommodate environmental justice considerations relating to impacts on, and participation by minority, low-income, and indigenous populations.[150] Addressing such

[147] 40 C.F.R. Part 300.

[148] CERCLA section 104(a)(1).

[149] See definitions of the terms "response," "removal," and "remedial action" at CERCLA sections 101(25), 101(23), and 101(24), respectively.

[150] *See* 40 C.F.R. § 300.430(e)(9)(iii).

environmental justice considerations through application of the nine factors set out in the NCP could, in turn, influence the final remedy selection decision.

II. PUBLIC PARTICIPATION

CERCLA section 117(a) provides for public participation before EPA's adoption of any plan for remedial action. This is consistent with the environmental justice goal of ensuring meaningful participation by communities in decisions that affect them. CERCLA section 117(e)(1) also provides EPA the discretionary authority to provide technical assistance grants (TAGs) to affected groups or individuals to help them interpret information about Superfund sites.

EPA has the legal ability to revise its guidance on public participation to enhance opportunities for participation of minority, low-income, or indigenous communities in remedy selection. EPA could also examine the regulations governing TAGs to determine whether they can be revised to enhance participation and better address the concerns of underrepresented communities, with appropriate revisions where it appears that improvements could be made. This could be done for public participation, and to some extent also for TAGs, without rulemaking.

III. TRIBES

CERCLA section 126(a) provides for a tribal role in Superfund actions for certain purposes. It specifies that "[t]he governing body of an Indian tribe shall be afforded substantially the same treatment as a State" with respect to various provisions of CERCLA, including provisions relating to notification of releases, consultation on remedial actions, access to information, and roles and responsibilities of states under the NCP.[151]

CERCLA also contains other provisions that provide for a tribal role. CERCLA authorizes tribes to enter into cooperative agreements and receive financial assistance to carry out response actions pursuant to section 104(d). For cleanups on land held by a tribe, land held in trust for Indians, land held by an Indian if subject to a trust restriction on alienation, or land otherwise within an Indian reservation, CERCLA exempts tribes from the requirements that apply to states to pay a share of response costs and to give certain assurances regarding hazardous waste disposal capacity pursuant to section 104(c)(3). Further, CERCLA authorizes tribes to recover costs incurred in carrying out response actions from persons responsible for releases and to act as trustees for tribal natural resources and seek recovery for damages to such resources. Thus, CERCLA provides many mechanisms for tribal participation in the Superfund process. And tribes are eligible for various types of EPA grants to assist in such participation.

Moreover, EPA has adopted regulations that define "State" to generally include tribes under the NCP, which governs most CERCLA response activities.[152] This enables tribes to carry out many of the functions of states and participate meaningfully in the decision-making and clean-up process.[153] Consistent with the NCP, tribal standards are potential "applicable or

[151] CERCLA sections 103(a), 104(c)(2), 104(e), and 105, respectively.

[152] 40 C.F.R. § 300.5 (also defining the term "Indian tribe," which is defined in CERCLA section 101(36)).

[153] 40 C.F.R. § 300.500(a).

relevant and appropriate requirements" (ARARs) for CERCLA response actions taken on tribal lands. Tribal standards can be treated in the same manner as state requirements provided they qualify as ARARs.

Participation of tribes in the Superfund process is generally governed by the text of CERCLA as well as EPA regulations found at 40 C.F.R. Part 35, Subpart O and Part 300, Subparts F and G. Tribes can enter into cooperative agreements with EPA and receive financial assistance to participate in cleanups as the lead or support agency. Tribes also may receive core program cooperative agreements that fund non-site specific activities that support a tribe's involvement in CERCLA responses and help develop tribal infrastructure. Further, like states, CERCLA directs EPA to consult with tribes when they are "affected" by a CERCLA response action.[154]

Additionally, in 2007, EPA amended subpart O to reduce obstacles to tribal involvement in CERCLA and "to fulfill CERCLA's mandate in sections 121 and 126" to provide tribes with substantial and meaningful involvement in Superfund.[155] The amended regulations authorize grants to intertribal consortia, as well as individual tribes, thereby reducing burdens on smaller tribes. The amendments also eliminate potentially burdensome requirements for tribes to show jurisdiction as a prerequisite to receiving financial assistance under core program cooperative agreements and most agreements to participate in response activities as support (rather than lead) agency. Finally, the amendments removed requirements for tribes to provide a cost share for core or support agency agreements, and eliminated requirements for tribes relating to property acquisition.

EPA could examine ways to better promote tribal participation in the Superfund process. EPA could enhance tribal outreach and communication with measures to ensure that tribes have an opportunity to participate in all stages of cleanups carried out on tribal lands. Furthermore, EPA could interpret CERCLA to facilitate broader participation by federally recognized Indian tribes.

IV. COOPERATIVE WORK WITH THE AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

Pursuant to CERCLA section 104(i), the Agency for Toxic Substances and Disease Registry (ATSDR) has responsibility to implement certain health-related authorities of CERCLA in cooperation with EPA and other federal agencies. EPA could explore with ATSDR the idea of giving priority to health concerns in areas where communities may be experiencing disproportionate health impacts. For instance, CERCLA requires ATSDR to consult with EPA on health issues related to exposure to hazardous or toxic substances and to prioritize health assessments in consultation with EPA, taking into consideration NPL schedules and the needs of EPA.[156] Health assessments conducted by ATSDR may be used to determine if a site should be listed on the NPL or to increase a site's priority upon the recommendation of the Administrator

[154] CERCLA sections 104(c)(2) and 126(a).

[155] 72 Fed. Reg. 24496 (May 2, 2007).

[156] CERCLA section 104(i)(6)(c).

of ATSDR.[157] In addition, an ATSDR health advisory that recommends protecting people from a release may be the basis for listing a release on the NPL.[158]

V. GRANTS AND COOPERATIVE AGREEMENTS

Pursuant to section 104(d) of CERCLA, EPA may enter into cooperative agreements or contracts authorizing states, political subdivisions, and Indian tribes to carry out activities authorized under section 104 of CERCLA, and may provide funding to states and tribes for program support and implementation (*e.g.*, core grants). EPA has the legal latitude to impose grant limitations or conditions to address environmental justice considerations relating to fair treatment and meaningful participation in environmental decision-making by minority, low-income, and indigenous populations.

[157] CERCLA section 104(i)(6)(H).

[158] 40 C.F.R. § 300.425(c)(3)(i).

CHAPTER FOUR: PESTICIDES AND TOXICS PROGRAMS

INTRODUCTION

This chapter discusses the Federal Insecticide, Fungicide, and Rodenticide Act,[159] the Federal Food, Drug, and Cosmetic Act,[160] the Toxic Substances Control Act,[161] and Section 313 of the Emergency Planning and Community Right-To-Know Act (EPCRA).[162] Section 303 of EPCRA is discussed in Chapter Three. As discussed below, these statutes and their implementing regulations provide various opportunities to address environmental justice considerations by focusing attention on minority, low-income, and indigenous populations (*e.g.*, subpopulations with unique diets). Most of the opportunities described herein are available under current law.

FEDERAL INSECTICIDE, FUNGICIDE, AND RODENTICIDE ACT

The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) provides a broad framework for the regulation of pesticides. Generally, FIFRA requires that all pesticides that are sold or distributed in the United States be "registered" by EPA. EPA may only register a pesticide if, among other things, the pesticide "will perform its intended function without unreasonable adverse effects on the environment," and if, "in accordance with widespread and commonly recognized practice[,] it will not generally cause unreasonable adverse effects on the environment."[163] In making a determination as to whether a pesticide causes unreasonable adverse effects on the environment, EPA is required to consider the economic, social, and environmental costs and benefits associated with the use of a pesticide. The burden of providing EPA with the necessary information to determine whether the standard for registration is met rests at all times with the registrant or applicant for registration. FIFRA is structured to provide for risk/benefit balancing. In making the risk/benefit determination, EPA relies on the authority under FIFRA and its implementing regulations to mitigate risks through various restrictions on labeling, conditioning registrations, and cancelling or suspending registrations. Additionally, there are regulations to protect workers and prescribe requirements for training and certification.

I. ACTIONS UNDER FIFRA SECTIONS 2, 3, 4 AND 6

The Agency's authority to register pesticides is found in section 3 of FIFRA. The standard for registration under section 3, *i.e.*, that a pesticide will perform its function without causing unreasonable adverse effects on the environment, is defined as "any unreasonable risk to man or the environment, taking into account the economic, social, and environmental costs and benefits of the use of any pesticide."[164] The statute does not restrict the scope of economic,

[159] 7 U.S.C. §§ 136-136y.

[160] 21 U.S.C. §§ 301-399a.

[161] 15 U.S.C. §§ 2601-2695d.

[162] 42 U.S.C. §§ 11001-11050.

[163] FIFRA section 3(c)(5).

[164] FIFRA section 2(bb).

social and environmental factors to be weighed in the cost/benefit analysis beyond the requirement that the cost or benefit be tied to the pesticide use.[165] To make the finding that a pesticide does or does not cause unreasonable adverse effects requires a full consideration of the risks and benefits of its use.[166]

Section 2(bb) of FIFRA provides that *any* unreasonable risk from pesticide use warrants consideration. This has been interpreted broadly to allow EPA to factor economic, social and environmental considerations into the cost/benefit analysis.[167] The Fifth Circuit Court of Appeals has found that "a significant risk of bird kills, *even if birds are actually killed infrequently*, may justify the Administrator's decision to ban or restrict diazinon use."[168]

Given the Congressional mandate to consider a wide range of factors in balancing costs against benefits, it is reasonable for the Agency to consider environmental justice considerations in its decision whether to register, retain, or cancel a pesticide. If there is a particular population that the Agency believes is disproportionately affected by or exposed to the pesticide, the Agency may take this into account in its assessment of social or human health costs associated with a given pesticide. EPA could also consider whether the people bearing the risks from the use of a pesticide are receiving any of the benefits from the use of the pesticide. In the past, EPA has considered similar issues in its risk assessments and regulatory decisions for lindane, endosulfan, soil fumigants, and rodenticides.

---

[165] *In re Lethelin Products Co., Inc.*, FIFRA Docket No. 392, 5 (1977); *In re Chapman Chemical Co.*, FIFRA Docket No. 246, 7 (1976).

[166] FIFRA section 3(c)(5); *accord Love v. Thomas*, 858 F.2d 1347 (9th Cir. 1988); *In re Chapman Chemical Co.*, FIFRA Docket No. 246, 7 (1976).

The legislative history of section 3(c)(5) directly supports reading the statute expansively. The Senate Committee on Agriculture and Forestry, in commenting on the amendments to section 2(bb) proposed by the Senate Committee on Commerce, noted that:

> [T]he balancing of benefit against risk is supposed to take every relevant factor that the Administrator can conceive of into account. The question he must decide is "Is it better for man and the environment to register this pesticide or is it better that this pesticide be banned?" He must consider hazards to farm workers, hazards to birds and animals and children yet unborn. He must consider the need for food and clothing and forest products, forest and grassland cover to keep the rain where it falls, prevent floods, provide clear water. He must consider aesthetic values, the beauty and inspiration of nature, the comfort and health of man. All these factors he must consider, giving each its due.

S. Comm. on Agriculture and Forestry, 92d Cong., Supp. Rep. (to accompany H.R. 10724) 10 (1972). The Conference Committee subsequently adopted the Senate's version of section 2(bb) in the final bill. *See* H.R. Rep. No. 92-1540, at 10, 30 (1972).

[167] *E.g.*, *Ciba-Geigy Corp. v. EPA*, 874 F.2d 277 (5th Cir. 1989); *In re Chapman Chemical Co,*, FIFRA Docket No. 246, 7.

[168] 874 F.2d at 279-80 (emphasis added); *accord In re Chapman Chemical Co.*, FIFRA Docket No. 246, 7 (a finding of *any* risk from the use of a particular pesticide, if the risk is "unreasonable" in relation to the benefits of its continued use, is sufficient to warrant cancellation. The standards for canceling and registering a pesticide are mirror images – both depend upon whether the pesticide causes unreasonable adverse effects).

A. Public Notice Prior to Registration of New Active Ingredient

Prior to registration, FIFRA requires public notice of the receipt of applications for registration of pesticides containing a new active ingredient or pesticides that would entail a changed use pattern.[169] The information required to be in the notice is relatively nominal and no risk assessment information is required to be provided.

Starting in October 2009, the Agency initiated an enhanced public participation process to provide information and an opportunity to comment on certain pesticide applications before they are registered. For new active ingredients, first food uses, first residential uses, first outdoor uses and any others that may have significant public interest, the Agency will post a risk assessment and a proposed decision for 30 days of public comment before making a decision on the registration. Generally, the Agency doesn't expect any of the information to be posted to involve claims of confidentiality, but posting will be done in accordance with appropriate confidential business information procedures. Should there be environmental justice considerations regarding a particular pesticide application, the public will have the opportunity to raise them through this process.

B. Regulatory Process After Registration

Once registered, pesticides must continue to meet the standard for registration. If they do not, the Agency may pursue cancellation or suspension under FIFRA section 6; as stated above, those steps would make it unlawful to sell and, possibly, use the pesticide. In 1996, Congress amended FIFRA to add section 3(g), which set forth the goal of periodically reviewing all pesticides on a 15-year cycle. To accomplish this, in 2006, EPA initiated a new program called "registration review." The program's goal is to review each pesticide active ingredient every 15 years to make sure that as the ability to assess risks to human health and the environment evolves and as policies and practices change, all pesticide products in the marketplace can still be used safely. In 2007, Congress again amended FIFRA section 3(g) to mandate the 15-year time period for subsequent pesticide registration review.

The same unreasonable adverse effects standard used for registering pesticides, which allows for consideration of environmental justice considerations, applies to FIFRA section 4 reregistration decisions, section 6 actions, and section 3(g) registration review actions. And, in suspension, cancellation, reregistration, and registration review, the public is provided with opportunities to participate in the process.

C. Information Available to the Public after Registration

Under FIFRA section 3(c)(2)(A), information is to be made available to the public once a pesticide is registered. Because of trade secret and related restrictions in FIFRA section 10, requests for such information must be made in accordance with the FOIA regulations at 40 C.F.R. Part 2.

D. Labeling of Pesticide Products

The Agency currently considers, and in appropriate circumstances imposes, certain locale-specific restrictions on pesticide uses. Such restrictions are often due to a pesticide's expected impacts when used in a particular climate or geographic area or when used in areas where certain endangered species may reside. Risk factors associated with minority, low-

[169] FIFRA section 3(c)(4).

income, and indigenous populations can be considered, where appropriate, in FIFRA section 3, 4, or 6 actions. In fact, in certain actions, EPA takes into consideration major identifiable subpopulations, as discussed more fully below.

FIFRA and its implementing regulations at 40 C.F.R. Part 156 provide EPA authority to require labeling restrictions on pesticide products. Labeling restrictions can be imposed to mitigate risks to specific populations or areas, by requiring that affected populations be made aware of the risks. Text on labels could include communicating risk reduction measures in ways appropriate to the circumstances of minority, low-income, and indigenous populations, including those with low English-language or general literacy rates.[170] The Agency has the authority to require that more extensive information about particular risks be shared with specific groups or communities, including factors that may reduce or increase risk of harm from exposure, and measures people can take to protect themselves.

E. Adverse Effects Reporting

In 1997, EPA promulgated a rule codifying EPA's interpretation regarding FIFRA section 6(a)(2), which requires pesticide registrants to report information concerning unreasonable adverse effects of their products to EPA.[171] The purpose of the rule is to clarify what information to submit and how and when to submit it. In addition, in situations when a pesticide registrant fails to report information or delays in reporting that information, the rule specifies which failures will be regarded by EPA as violations of FIFRA section 6(a)(2), and subject to action under FIFRA sections 12(a)(2)(B)(ii) and 12(a)(2)(N). These reports are used in the registration and subsequent periodic review of registrations to determine if further regulatory action is necessary. These reports sometimes include information on specific subpopulations that could inform future regulatory actions to mitigate adverse effects, and could be used to implement other strategies identified in paragraph D above.

F. Requests for Additional Data

The Agency has broad authority to require data generation and submission by registrants after a pesticide is registered. Under FIFRA section 3(c)(2)(B), EPA can require registrants to submit data that it determines are "required to maintain in effect an existing registration." The data could include focused information about the adverse effects on minority, low-income, and indigenous populations. The data could also include more focused information on exposure to pesticides of farm workers and their children; minority, low-income, and indigenous populations; or animals, water, land and other resources that are of special importance to particular populations.

Should the Agency determine that registrants need to develop and submit data relating to exposure of, or adverse effects on, minority, low-income, and indigenous populations in order to maintain an existing pesticide registration, section 3(c)(2)(B) of FIFRA can be used to impose the data requirement. Once the data are obtained, the Agency can use them in its regulatory decision-making.

[170] For example, 40 C.F.R. § 156.206(e) requires certain warning statements be in Spanish, as well as English.

[171] 40 C.F.R. Part 159. *See also* 62 Fed. Reg. 49370 (Sept. 19, 1997).

G. Improvements to Human Health Risk Assessment Procedures

In February 2010, EPA announced its intent to use important risk assessment techniques developed in the implementation of the Food Quality Protection Act of 1996 (FQPA) in all pesticide risk assessments. The FQPA, which rewrote section 408 of the Federal Food, Drug, and Cosmetic Act (FFDCA) (see discussion below), required EPA to aggregate pesticide exposures from all sources – from food, from drinking water, and from use of pesticides in the home – and also mandated that EPA take into account the cumulative effects from exposures to multiple pesticides that have a common mechanism of toxicity. Further, the FQPA amendments directed that an additional safety factor be used to protect infants and children from the risks of pesticides given the lack of complete data on the potentially increased sensitivity to pesticides in the young. Risk assessment techniques developed over the last 13 years in the wake of these mandates have progressed from cutting-edge procedures to well-established scientific practice.

Currently, many risk assessment techniques are now used in assessing risks to agricultural workers from pesticide exposures on the job or to the general public from pesticides that are used in homes but not in growing food. Some techniques will undergo external, scientific peer-review. The revisions to EPA's risk assessment methods ensure that EPA, in assessing risk, treats all pesticide exposures – and all people who are exposed to pesticides – the same.

II. FIFRA WORKER PROTECTION STANDARD IN 40 C.F.R. PART 170

A. Overview

All agricultural employers, owners, and managers, as well as labor contractors, are required to comply with the worker protection standards (WPS) when using pesticides with labeling that refers to the WPS on an agricultural establishment. Most WPS requirements apply to agricultural workers or pesticide handlers, but there are some requirements that apply to all persons and some that apply only to certain persons such as those who handle pesticide application equipment or clean pesticide-contaminated personal protective equipment.

Currently, the regulation includes numerous safeguards ranging from protective clothing and precautionary field reentry limits to requirements for warning and worker training. The safeguards promote environmental justice to the extent they are used to mitigate risks to minority, low-income, and indigenous workers that are disproportionately exposed to risks of harm from the pesticides due to their work. EPA is completing draft revisions to the worker safety regulations. The draft revisions are intended to improve protections for agricultural workers, including workers in minority, low-income, and indigenous populations. Likewise, the Agency is completing draft revisions to the certification regulations.[172] The certification revisions may include, for example, changes to the certification plans in Indian country.

The Agency might also examine other related areas that were not covered in the WPS. One such area is the potential pesticide exposure of farm workers and their families who live near treated fields. Under the current regulations, pesticide labels may contain (and some already do contain) restrictions on applications to avoid potential pesticide exposure from pesticide drift to those who live in or near treated fields.

[172] 40 C.F.R. Part 171 sets forth the requirements for certifying applicators of restricted use pesticides as required by FIFRA section 11.

Pesticide drift is a major concern. Frequently, workers and their families live near the treated fields, and they may be impacted by airborne pesticide residues following application. EPA is considering additional safeguards, which could afford such people greater protection. For example, the Pesticide Programs Dialogue Committee has a subcommittee that has been addressing the issue of pesticide spray drift. As an outcome of this subcommittee's work, EPA issued a draft Pesticide Registration Notice for public comment to address many of the concerns discussed at these meetings. Recommendations in the Pesticide Registration Notice promote environmental justice through recommending language for pesticide labeling to reduce spray drift, and thereby further protecting human health in general and affected minority, low-income, and indigenous populations, in particular, from the adverse effects of the pesticides. EPA is finalizing the Pesticide Registration Notice, taking into account the numerous comments the Agency received during the comment period.

B. Examples of How EPA Implements FIFRA Authorities to Advance Environmental Justice

Over the past decade, OPP has engaged in a number of activities to enhance the protections provided by the worker protection standards. For example, in 2005, a collaborative partnership with the Association of Farmworker Opportunity Programs was formed to improve pesticide safety training for farm workers and their families. EPA works with the association to increase the number of farm workers and families trained in pesticide safety. New pesticide training efforts are being undertaken to prevent take-home exposures to farm worker children.

Between 2002 and 2004, worker protection assessment workshops were held around the country. These workshops included public meetings with worker advocacy groups, agricultural interest groups, regulators, health care providers, and pesticide safety trainers in Texas, California, Florida, and the District of Columbia to evaluate the agricultural worker protection regulation and potential changes to the regulation and the program. Also, focused work group meetings were held to develop more detailed responses and recommendations for potential changes. In Texas, Florida, and California, work group members had field experience with hazard communication, worker and handler training scenarios, and constraints on posting and decontamination recommendations. In addition to these workshops, there have been numerous training courses created that specifically focus on the applicability and practicability of potential regulatory change options. Field tours are standard for such courses.

III. TREATMENT OF TRIBES AND INDIAN COUNTRY UNDER FIFRA

With the notable exception of FIFRA section 23, which is discussed below, FIFRA does not explicitly reference federally recognized Indian tribes or implementation in Indian country. The term "Indian tribe" is not defined in FIFRA, and the current definition of the term "State" in section 2(aa) of FIFRA does not mention tribes or Indian country. Because states generally lack authority to regulate in Indian country, the absence of explicit references to tribes and Indian country in several sections of FIFRA raises issues about implementation of those provisions in Indian country, which may include areas with overburdened communities.

While the pesticide registration program is generally national in scope, section 18 of FIFRA authorizes states to request that EPA grant exemptions from the requirements of FIFRA to allow use of pesticides that would otherwise not be authorized under that statute in order to respond to a pest-related emergency situation in the state. And states have the authority under

section 24(c) of FIFRA to register additional uses of pesticides in order to respond to special local needs. Because tribes are not explicitly referenced in either of these sections, they have not generally had the benefits of these provisions of FIFRA even in situations where they, like their non-tribal neighbors, may have special local pest-related needs or emergencies.

EPA has, however, used other authorities available in FIFRA to help ensure that the statute's benefits are available to communities in Indian country. On November 28, 2008, the Administrator approved a three-year pilot program under the auspices of section 2(ee)(6) of FIFRA that allowed the use of registered pesticides in Indian country consistent with the use allowed under an emergency exemption or special local-needs registration where such exemption or section 24(c) registration is in effect in the same state as the areas of Indian country (or, if the exemption or registration is limited to particular counties within a state, in the same county as the areas of Indian country).[173] This section 2(ee)(6) finding minimized any programmatic gap in the event of special local needs or emergencies in Indian country.

As noted above, FIFRA section 23 contains the only explicit reference to Indian tribes in the statute. It authorizes EPA to enter into cooperative agreements with Indian tribes for specified purposes to carry out FIFRA. Consistent with section 23, EPA enters into cooperative agreements with tribes (often relating to inspections). EPA interprets FIFRA sections 11 and 23 to authorize EPA approval of tribal certification and training programs for applicators of restricted use pesticides.[174] Currently, the Agency is working on revisions to 40 C.F.R. § 171.10 to improve options for certifying applicators in Indian country.

IV. INTEGRATED PEST MANAGEMENT

Under 7 U.S.C. § 136r-1, EPA, in coordination with the U.S. Department of Agriculture, "shall implement research, demonstration, and education programs to support adoption of Integrated Pest Management." Additionally, the two agencies "shall make information on Integrated Pest Management widely available to pesticide users, including Federal agencies. Federal agencies shall use Integrated Pest Management techniques in carrying out pest management activities and shall promote Integrated Pest Management through procurement and regulatory policies, and other activities." Integrated Pest Management (IPM) is an effective and environmentally sensitive approach to pest management that relies on a combination of common-sense practices. IPM programs use current, comprehensive information on the life cycles of pests and their interaction with the environment. This information, in combination with available pest control methods, is used to manage pest damage by the most economical means, and with the least possible hazard to people, property, and the environment.

EPA recommends that schools use IPM to reduce pesticide risk and exposure to children and is advancing national implementation. EPA also supports IPM use in public housing. EPA

[173] Section 2(ee)(6) of FIFRA allows the Administrator to determine that certain uses of a registered pesticide should not be considered violative of FIFRA notwithstanding the fact that the uses are not specifically authorized by the labeling of the registered pesticide. In this particular instance, the Administrator used this authority to determine that use in areas of Indian country that is similar to use authorized under section 18 or 24(c) on neighboring lands is not inconsistent with the purposes of FIFRA and will thus no longer be considered unlawful under FIFRA (unless a tribe declines to be included in the pilot program).

[174] *See* 40 C.F.R. § 171.10.

further encourages growers to use IPM to identify pests before they use pesticides to ensure that the proper control method is used. EPA can consider whether IPM practices constitute necessary labeling restrictions when assessing the risks and benefits of a pesticide.

V. INFORMATION AND TRAINING

FIFRA section 23(c) authorizes EPA, in cooperation with the U.S. Department of Agriculture (USDA), to use the services of cooperative state extension services to inform and educate pesticide users. When registering or reviewing already-registered products, EPA can place training and information requirements on a registration and labeling to help ensure that there are no unreasonable adverse effects on the environment.

VI. PACKAGING STANDARDS

Under FIFRA section 25(c)(3), EPA has the authority to establish standards for package, container, or wrapping in order to protect children and adults from serious injury or illness due to accidental ingestion or contact with the pesticide. For example, under this authority, EPA has required that certain products contain child-resistant packaging to reduce the potential exposure of children to a pesticide.

VII. IDENTIFICATION OF PUBLIC HEALTH PESTS

FIFRA section 28(d) provides EPA with the authority to identify pests of significant public health importance and develop and implement programs to improve and facilitate the safe and necessary use of pesticides to control such pests. Public health pests – such as insects that carry vector-borne diseases, rodents, and microbes – can cause serious risks to public health. Because such pests may be prevalent in overburdened communities, addressing such prevalence would advance environmental justice. EPA provides information to the public about the safe use of such pesticides in homes and schools. Providing the information discussed above to minority, low-income, and indigenous populations will further advance environmental justice.

FEDERAL FOOD, DRUG, AND COSMETIC ACT (FFDCA)

In addition to the general licensing and registration scheme in FIFRA, EPA also exercises statutory authority over pesticides under the FFDCA. The FFDCA contains provisions addressing pesticide residues in foods. EPA is authorized to set tolerances (maximum residue regulations) for pesticides in food under the FFDCA. The Food and Drug Administration and the U.S. Department of Agriculture monitor the food supply to enforce compliance with EPA-established tolerances.

EPA sets tolerances for pesticide residues in food under section 408 of the FFDCA. Its provisions require EPA to determine that the tolerances will be safe. "Safe" means there is a reasonable certainty of no harm. Unlike FIFRA, which balances risks and benefits, this is a risk-only standard. Importantly, the FFDCA's risk-only standard has been written into FIFRA for pesticides used on food.

In implementing the reasonable certainty of no harm standards in the setting of tolerances, as well as in the FIFRA registration process, EPA considers consumption patterns of

major identified subpopulations to determine the degree of risk posed by pesticide residues. If certain groups have a common diet, that factor can be taken into account in ruling on pesticide tolerances and registrations. More specifically, if the data are available, EPA can take into account different exposures or dietary consumption patterns for an identifiable minority, low-income, and indigenous population (*e.g.,* Inuit dietary consumption patterns). EPA's ability to consider the diets of subpopulations is limited by data availability. EPA relies on surveys done every decade or so for consumption information. To further the use of its ability to consider dietary consumption patterns, EPA could seek to ensure that future consumption surveys adequately sample individuals from overburdened communities. Also, EPA could solicit additional information on this subject in notices it publishes in allowing for public comment in FFDCA proceedings.

Under FFDCA section 408(b)(2)(C), EPA must specifically consider the exposure of infants and children when determining if the pesticide residue is safe. Dietary consumption patterns of children and infants are considered in the tolerance setting process.

Under FFDCA sections 408(d) and (e), the public may participate in the establishment, modification, suspension or revocation of a pesticide tolerance. Unlike FIFRA section 3(c)(4), mentioned above, where the notice is nominal (usually the name of the new active ingredient), in general, under the FFDCA the public is provided more information, including risk assessments. However, the rulemaking requirements under FFDCA section 408 are unique, and tolerances may be established, modified, or revoked in response to a petition. Although EPA must publish notice of the petition and make available a summary of the petition, EPA may issue a final rule acting on the petition without issuing a proposed rule or making other information available prior to issuance of the final rule. Final rules are subject to an administrative objection and hearing process.

EPCRA SECTION 313 AND RELATED AUTHORITIES

The Emergency Planning and Community Right-to-Know Act of 1986 (EPCRA) was enacted in response to incidents involving major chemical releases, including the 1984 release of methyl isocyanate in Bhopal, India. (See Chapter Three for a discussion of EPCRA section 303.) The statute provides for emergency planning and emergency release notification at the state and local level. The Toxics Release Inventory (TRI) was established pursuant to EPCRA section 313, which provides for reporting requirements for facilities within certain industry groups that manufacture, process or use toxic chemicals. Under EPCRA section 313 and its implementing regulations at 40 C.F.R. Part 372, covered facilities must report releases to all environmental media. The Pollution Prevention Act of 1990 (PPA)[175] significantly expanded the information required to be reported by facilities that are subject to EPCRA section 313 reporting requirements. In addition, Executive Order 12856[176] requires federal agencies to comply with the planning and reporting provisions of EPCRA and the PPA.

[175] 42 U.S.C. §§ 13101-13109.

[176] The Executive Order is entitled "Federal Compliance With Right-to-Know Laws and Pollution Prevention Requirements" and was published at 58 Fed. Reg. 41981 (Aug. 6, 1993).

I. EPCRA

Under section 313 of EPCRA, specified facilities must report annually to EPA and the states on releases of listed toxic chemicals. The reporting requirements apply to owners and operators of facilities that have ten or more full-time employees and that are in a covered Standard Industrial Classification (SIC) Code or North American Industry Classification System (NAICS) Code as listed in 40 C.F.R. § 372.23. These facilities must report if they manufacture, process or otherwise use a listed toxic chemical in quantities that exceed specified thresholds. The required information, typically submitted on EPA "Form R," includes whether the chemical is manufactured, processed or used; the maximum amounts of toxic chemical present at the facility in the preceding year; waste treatment and disposal methods used; and the annual quantity of chemical released to the environment.

Section 313(h) states that the annual release report forms required under EPCRA "are intended to provide information to the Federal, State, and local governments and the public, including citizens of communities surrounding covered facilities." Section 313(j) provides that EPA must make these annual release reports publicly accessible in a computer data base, which EPA has established as the TRI, which can be accessed through web tools such as TRI Explorer.[177] EPA also annually compiles, analyzes, and publishes the data.

The various tools the TRI program uses to communicate TRI data to the public may provide excellent opportunities to communicate valuable information about releases in overburdened communities. Because data can be sorted on a facility-by-facility basis, release information can be organized around socio-economic factors such as race or income. Information about potential exposure to toxic chemicals in overburdened communities may be useful to EPA, other agencies and members of the community. The TRI program could choose to focus education and outreach activities for minority, low-income, and indigenous populations. Future efforts to make data available to communities could consider the particular needs of overburdened communities in decisions regarding how to present the information.[178] Moreover, EPA might bring greater focus to environmental justice considerations as it prioritizes chemicals or industry sectors to be added to TRI. For example if certain chemicals or chemical-intensive industries are disproportionately present in overburdened communities, the Agency may consider adding those chemicals or industries through rulemaking under EPCRA sections 313(d) and 313(b)(1)(B), respectively.

In addition, EPA has discretionary authority under EPCRA section 313(b)(2) to add individual facilities to those that must report their releases of toxic chemicals:

[177] Fulfilling this requirement of EPCRA section 313(j) is consistent with the directive in the Presidential memorandum accompanying Executive Order 12898 that provides for agencies to "ensure that the public, including minority communities and low-income communities, has adequate access to public information relating to human health . . . when required . . . under [EPCRA]." 30 Weekly Comp. Pres. Doc. at 280.

[178] However, data users should also be made aware that the TRI data has several important limitations. For example, it does not provide a comprehensive data set of all toxic chemical releases, nor does it provide actual exposure information.

> The Administrator, on his own motion or at the request of a Governor of a State (with regard to facilities located in that State), may apply the requirements of this section to the owners and operators of any particular facility that manufactures, processes, or otherwise uses a toxic chemical listed under subsection (c) of this section if the Administrator determines that such action is warranted on the basis of toxicity of the toxic chemical, proximity to other facilities that release the toxic chemical or to population centers, the history of releases of such chemical at such facility, or such other factors as the Administrator deems appropriate.

One potential consideration in identifying additional facilities for reporting could be location in overburdened communities, including those that are minority, low-income, or indigenous. The TRI program has begun a preliminary effort to identify types of facilities that might be good candidates for the use of this tool.

EPA may also set different (lower or higher) thresholds for reporting from certain facilities under EPCRA section 313(f)(2). At the Administrator's discretion, these thresholds may apply to classes of chemicals or to categories of facilities. Presumably, a category of facilities could be characterized based on proximity to overburdened communities.

II. POLLUTION PREVENTION ACT OF 1990

Under section 6607(a) of the PPA, each owner or operator of a facility is required to annually file a toxic chemical release form under EPCRA section 313. They must include with the annual report a toxic chemical source reduction and recycling report for the preceding calendar year. Section 6607(b) of the PPA details the information that is required to be included in the toxic chemical source reduction and recycling report. As a result of these PPA provisions, there are seven additional categories of pollution prevention and recycling data that must be reported annually under EPCRA section 313.

III. EXECUTIVE ORDER 12856

Owing to Executive Order 12856, all federal facilities are now required to adhere to the same planning and reporting provisions of federal right-to-know and pollution prevention laws that cover the private sector. This Executive Order goes beyond EPCRA requirements in an attempt to set a new standard for federal facilities to adhere to right-to-know principles and a pollution prevention ethic. On January 26, 2007, Executive Order 13423[179] superseded EO 12856 regarding federal facility reporting. Instructions on implementing the Executive Order confirm that federal facilities continue to report under EPCRA section 313 and PPA section 6607.

TOXIC SUBSTANCES CONTROL ACT

The Toxic Substances Control Act (TSCA) gives EPA broad authority to gather information about and to regulate any part of the life cycle of chemical substances and mixtures

[179] The Executive Order is entitled "Strengthening Federal Environmental, Energy, and Transportation Management" and was published at 72 Fed. Reg. 3919 (Jan. 26, 2007).

to protect human health and the environment from unreasonable risks of injury. Subchapter I sets out general authorities applicable to the entire universe of chemical substances and mixtures; it also specifies requirements for PCBs and mercury. Subchapter II addresses asbestos in schools and other public and commercial buildings; Subchapter III sets up a program for addressing indoor exposure to radon; Subchapter IV establishes extensive regulation of the hazards of lead in paints and homes; Subchapter V provides authority for EPA to provide grants and issue guidance to promote healthy, high-performance schools; and Subchapter VI establishes formaldehyde standards for composite wood products and requires EPA to promulgate implementing regulations. The core of TSCA is principally designed to regulate through three basic themes: (1) a program of federal scrutiny of new chemicals before they are distributed in commerce; (2) information-gathering authorities (including authority to require testing of chemicals and mixtures); and (3) substantive regulation at any or all stages of a chemical's or mixture's life cycle.

I. FINDINGS AND INTENT

When Congress enacted TSCA, it set out its findings, policy, and intent in section 2. This section expresses a broad concern over potential risks to human health and the environment, and a desire to vest in EPA "adequate authority" to regulate chemical substances and mixtures that present an "unreasonable risk of injury to health or the environment." In addition, section 2(c) clearly states that Congress intended EPA to "consider the environmental, economic, and social impact of any action" taken under TSCA. This explicit statement of intent – particularly the broad reference to "social impact" – could provide the opportunity for EPA to consider and apply environmental justice considerations to all regulatory actions under TSCA. The statute does not provide a definition for "social impact," nor has EPA defined this term in its regulations. However, EPA has specifically considered disproportionately impacted populations during rulemaking under TSCA. For example, EPA removed an "opt-out" provision from its Renovation, Repair and Painting Rule in part because of concerns related to minority and low-income populations.[180]

II. TSCA SUBCHAPTER I

In general, Congress gave EPA broad discretion to select which chemical substances or mixtures to investigate and regulate. This suggests that EPA can consider the interests of minority, low-income, and indigenous populations when setting priorities concerning which chemical substances or mixtures warrant EPA's attention for assessment and possible regulatory action.

Most of EPA's general regulatory authority flows from sections 4, 5, and 6 of TSCA. Each of these sections serves a different regulatory purpose, and therefore each applies the "unreasonable risk" standard in a different way. Section 4 allows EPA to require testing to determine the effects of a chemical substance or mixture on health or the environment where EPA determines that there are insufficient data and experience to determine those effects, and where EPA finds that the substance or mixture "*may present* an unreasonable risk of injury" (emphasis added), or that the substance or mixture is produced in substantial quantities and may enter the environment "in substantial quantities" or pose "significant or substantial human

[180] *See* 75 Fed. Reg. 24802, 24804-05 (May 6, 2010).

exposure." Because this section addresses risks that are uncertain, the threshold for regulatory action is less difficult to meet than the threshold for substantive regulation under section 6 (see below). EPA has generally prioritized chemical substances to investigate for possible section 4 testing based on volume or suspected hazard, but the Agency has substantial discretion to select chemical substances; considering impacts on overburdened communities also would appear to fit within the Congressional intent that EPA consider "social impacts" of regulatory actions. In addition, because the "unreasonable risk" standard entails a balancing of the costs and benefits of regulation, EPA might be able to consider whether a risk is borne disproportionately by minority, low-income, and indigenous populations in evaluating whether it may be "unreasonable."

TSCA section 5, among other things, prevents the commercial manufacture or import of any new chemical substance in the United States until 90 days after EPA is notified of the intended manufacture or import. EPA can also, by rule, require similar notification from manufacturers, importers, and processors of significant new uses of existing chemical substances. During the notification period, EPA reviews information in the notice. As under section 4, EPA can regulate new chemicals or significant new uses pending the development of information based on a lower threshold of certainty; if a substance "may present an unreasonable risk," EPA can impose restrictions on the manufacture, processing, distribution in commerce, use, or disposal of the substance, or requirements to conduct tests on the substance. In addition to the impacts that may be caused by the chemical substance generally, this broad pre-market entry review can take into account the submitting company's circumstances such as a manufacturing plant's location, thus presenting another possible opportunity for considering impacts on minority, low-income, and indigenous populations.

TSCA section 6 gives EPA its broadest authority to regulate any chemical substance or mixture if there is "a reasonable basis to conclude" that the substance or mixture "presents or will present an unreasonable risk of injury to health or the environment." This provision allows EPA to address risks in all environmental media – water, air, land, or any combination of media. Similarly, TSCA section 6 gives EPA the authority to address the unreasonable risk that occurs from a broad range of activities – manufacturing, processing, distribution in commerce, use, or disposal. EPA can establish TSCA section 6 requirements that are limited to specified geographic areas.

Although the standard for acting under section 6, *i.e.*, that a substance "presents or will present" an unreasonable risk, is stricter than the "may present" standard in sections 4 and 5, it does not require factual certainty that a risk is unreasonable, but rather a "reasonable basis" for that conclusion. The legislative history of TSCA makes it clear that EPA may take regulatory action to prevent risk even though there are uncertainties as to the threshold level of risk. In making the unreasonable risk determination, TSCA section 6(c)(1) requires EPA to consider:

A. The effects of the chemical on health and the magnitude of its exposure to humans;

B. The effects of the chemical on the environment and the magnitude of its exposure to the environment;

C. The benefits of the chemical for various uses and the availability of substitutes; and

D. The reasonably ascertainable consequences of regulation, after consideration of the effect on the national economy, small businesses, technological innovation, the environment, and public health.

In essence, the finding of unreasonable risk involves a balancing of the probability that risk will occur and the magnitude and severity of that risk, against the adverse effects on society of proposed Agency action to reduce the risk. As stated above, EPA could argue that the determination of whether a risk is unreasonable could include consideration of whether it is disproportionately borne by minority, low-income, or indigenous populations, including an examination of potential cumulative exposures of such populations. Further, EPA could base regulation under section 6 on consideration of the most vulnerable or exposed populations.

The broad discretion vested in EPA to administer this standard through regulations means that the Agency could potentially consider the impacts of such regulations on minority, low-income, and indigenous populations. For example, if EPA had information about manufacturing or processing of a chemical presenting an unreasonable risk of injury to health or the environment with respect to a particular area with a significant minority, low-income, or indigenous population, EPA may be able to address the risk through a regulation under TSCA section 6.

As mentioned above, TSCA directly regulates the manufacture, processing, distribution in commerce, use and disposal of PCBs under section 6(e). Because of the specific statutory prohibitions on PCBs, EPA does not have to demonstrate that PCBs "present or will present" an unreasonable risk to impose regulatory conditions. In fact, to allow an ongoing use of PCBs, EPA must find that it will pose "no unreasonable risk" of injury to health or the environment. The implementing regulations[181] for section 6(e) establish disposal requirements for PCBs and regulatory conditions for continuing to use remaining PCB-containing equipment to ensure its safe operation. Under these rules, EPA reviews applications for approval of PCB disposal facilities, applying the "no unreasonable risk" standard. It is possible that EPA could consider the interests of minority, low-income, and indigenous populations in the "no unreasonable risk" analysis for such facility-specific approvals.

III. TSCA SUBCHAPTER II: ASBESTOS

Subchapter II of TSCA, the Asbestos Hazard Emergency Response Act (AHERA),[182] was enacted to establish a uniform program for addressing the presence of asbestos in school buildings. Pursuant to TSCA section 212, EPA has appointed an Asbestos Ombudsman who is tasked with receiving "complaints, grievances, and requests for information submitted by any person with respect to any aspect of [AHERA]" and with rendering "assistance with respect to the complaints, grievances, and requests received." The Asbestos Ombudsman also is responsible for making any recommendations to the Administrator that he or she feels are appropriate. Owing to this defined role, the Asbestos Ombudsman can serve as a useful interface between the Agency and any community dealing with environmental justice considerations that relate to or fall within the scope of AHERA. In addition, the Asbestos Ombudsman is uniquely

[181] 40 C.F.R. Part 761.

[182] 15 U.S.C. §§ 2641-2656.

situated to recommend and promote actions on the part of EPA that might address any such concerns.

IV. TSCA SUBCHAPTER III: INDOOR RADON

Subchapter III of TSCA established various cooperative relationships between EPA, the U.S. Department of Housing and Urban Development, and states to develop and implement programs to assess and reduce indoor exposure to radon. There are two separate provisions concerning federal assistance to state radon programs that explicitly call for application of a criterion that could be implemented to advance environmental justice. First, TSCA section 305 describes technical assistance that EPA must provide to state radon programs. Both sections 305(a)(5) and 305(a)(6) include statements that, to the maximum extent practicable, "homes of low-income persons" should be selected for projects that evaluate homes and demonstrate radon mitigation methods. Second, TSCA section 306(i)(2) establishes a limitation on financial assistance (grants) that a recipient state "should make every effort, consistent with the goals and successful operation of the State radon program, to give a preference to low-income persons."

V. TSCA SUBCHAPTER IV: LEAD-BASED PAINT HAZARDS

Subchapter IV was added to TSCA in October 1992. This Subchapter deals with hazards from lead-based paint. The TSCA Subchapter IV lead-based paint hazard rules are important to advancing environmental justice when the risk reduction to be achieved affects public or inner-city housing. To the extent that lead-based paint hazards disproportionately affect minority, low-income, and indigenous populations, EPA can argue that there is authority under TSCA section 2(c) (discussed above) to factor environmental justice considerations into the implementation of TSCA Subchapter IV authorities.

EPA has, in fact, considered environmental justice factors in a title IV rulemaking. In 2008, EPA promulgated a rule governing renovation activities in pre-1978 housing and child-occupied facilities (mostly pre-schools and day-care centers) pursuant to TSCA section 402(c)(3).[183] Subsequently, in July of 2010, EPA amended the 2008 rule by eliminating the "opt-out" provision that excused contractors from the lead-safe work practice requirements if the homeowner provided the contractor with a signed statement having to do with the presence of children or pregnant women.[184] In extending the rule requirements to all pre-1978 housing and child-occupied facilities regardless of current occupancy, EPA explicitly cited environmental justice considerations as one of the reasons for making the change.

EPA may have additional opportunities to factor in environmental justice considerations. For example, in October 2009, EPA committed to initiate an appropriate proceeding to review whether the current lead hazard standards EPA promulgated in 2001 under TSCA section 403 are sufficiently protective. In so doing, EPA may have the opportunity to account for heightened risk factors such as diet and exposure of vulnerable populations. Under TSCA section 405(d) EPA is to engage in public education and outreach activities to increase public awareness of a variety of health issues related to lead exposure and poison prevention. Specifically, TSCA section 405(d)(2) provides that public education and outreach activities shall be designed to

[183] *See* 73 Fed. Reg. 21692 (April 22, 2008) (codified at 40 C.F.R. Part 745, Subparts E and Q).

[184] *See* 75 Fed. Reg. 24802 (May 6, 2010) (codified at 40 C.F.R. Part 745, Subpart E).

provide educational and information to: health professionals; the general public, with emphasis on parents of young children; homeowners, landlords, and tenants; consumers of home improvement products; the residential real estate industry; and the home renovation industry. There may be opportunities to target such education and outreach to high-risk populations.

VI. TSCA SUBCHAPTER V: HEALTHY HIGH-PERFORMANCE SCHOOLS

Section 2695a of TSCA requires EPA, in consultation with the U.S. Departments of Education and Health and Human Services, to issue voluntary school site selection guidelines that account for, among other things, the special vulnerability of children to hazardous substances or pollution exposures. These guidelines are available on the EPA website and are accompanied by "related links and resources" that provide a variety information on environmental justice.[185]

Section 2695c of TSCA requires EPA, in consultation with the U.S. Departments of Education and Health and Human Services, to issue voluntary guidelines for use by states in developing and implementing environmental health programs for schools. Among other things, the guidelines are to take into account the special vulnerability of children in low-income and minority communities to exposures from contaminants, hazardous substances, and pollution emissions, and the impact of school facility environments on student and staff disabilities and special needs.

Section 2695 of TSCA authorizes EPA, in consultation with the U.S. Department of Education, to provide grants to assist states in, among other things, implementing state school health programs and identifying ongoing school building environmental problems. To the extent health and environmental problems associated with schools disproportionately affect minority, low-income, and indigenous populations, EPA could use this authority to address environmental concerns. Section 2695 has a sunset provision, expiring Dec. 19, 2012.

[185] *See* "School Siting Guidelines" available at: http://www.epa.gov/schools/siting/.

CHAPTER FIVE: TRIBAL PROGRAMS

EPA'S INDIAN POLICY AND TRIBAL CONSULTATION

Protecting Indian tribes and the places where they live is an important aspect of implementing EPA's commitment to environmental justice. Tribal communities often face vulnerabilities due to lack of a health care infrastructure and heightened exposure to certain toxins. In general, EPA's discretionary authority to promote environmental justice, as discussed in other chapters of this document, is available to address human health and environmental conditions in tribal communities, consistent with Executive Order 12898 on environmental justice, which applies to tribal populations, Native American programs, and federally recognized Indian tribes.[186] EPA advances environmental justice in Indian country by, among other things, assisting tribes in developing their own programs to protect the health of tribal members and their environment and by directly implementing federal programs in Indian country. Tribes are sovereign governments that retain important powers over their members and territory. This chapter focuses on ways to enhance the exercise of tribal sovereignty to protect human health and the environment in Indian country under EPA's statutes. For a discussion of EPA's direct implementation of its statutes in Indian country, see Chapters One to Four.

EPA has a long-standing commitment to work directly with federally recognized tribes as partners on a government-to-government basis to protect tribal health and environments, as illustrated by EPA's Indian Policy and related Headquarters and Regional policy statements and guidance documents. In 1984, EPA became the first federal agency to adopt an Indian Policy.[187] In that Policy, which has been reaffirmed by each EPA Administrator since its adoption, EPA recognized the importance of ensuring close involvement of federally recognized tribal governments in making decisions and managing environmental programs affecting their areas and members. Among other things, the Agency committed to look directly to tribal governments to play an important role in setting standards, making environmental policy decisions, and managing programs in their areas. For a number of programs, one aspect of EPA's implementation of this approach is to treat eligible tribes in a similar manner as states for purposes of receiving grants and administering approved environmental regulatory programs and other functions under EPA statutes. This approach enables tribes to perform essentially the same role in their areas that states play outside of Indian country in regulating the environment under EPA statutes.[188] In other cases, EPA can advance environmental justice in Indian country by directly implementing EPA programs there.

---

[186] As used in Executive Order 12898, the terms "minority population" and "low-income population" include American Indians and Alaska Natives. *See* Appendix A to the Council on Environmental Quality's publication "Environmental Justice: Guidance Under the National Environmental Policy Act" at pages 25-26 (Dec. 10, 1997) (providing guidance on key terms in Executive Order 12898). Moreover, Section 6-606 of the EO provides that its provisions apply equally to Native American programs and that steps be taken to address federally recognized Indian tribes.

[187] *EPA Policy for the Administration of Environmental Programs on Indian Reservations* (Nov. 8, 1984). The Policy was issued by then-Administrator William D. Ruckelshaus and is available at http://www.epa.gov/tribal/pdf/indian-policy-84.pdf.

[188] The term "Indian country" as defined at 18 U.S.C. § 1151 means:

Consistent with EPA's 1984 Indian Policy and other federal policies, EPA is committed to consulting with tribal governments on matters that affect their communities and environments. Effective tribal consultation continues to be a stated goal of the federal government. In November 2009, President Obama issued a memorandum reiterating a commitment to regular and meaningful consultation and collaboration with tribal governments on federal decisions that affect them.[189] The memorandum also directed federal agencies to develop a detailed plan of actions to implement the policies and directives of Executive Order 13175,[190] which relates to coordination and consultation with tribal governments on federal actions with tribal implications. On May 4, 2011, the Agency released its new *EPA Policy on Consultation and Coordination with Indian Tribes*,[191] to further implement Executive Order 13175 and EPA's 1984 Indian Policy. The new policy sets a broad standard for when EPA should consider consulting on a government-to-government basis with federally recognized tribal governments. Notably, the scope of the new policy is broader than that found in Executive Order 13175. The new policy establishes clear standards for EPA's consultation process, as well as a management oversight and reporting structure to ensure accountability and transparency. When considering legal tools that may affect tribal interests, including those described in this document to enhance tribal governmental involvement in the protection of human health and the environment in Indian country, EPA will first consult with tribal governments before any decisions are made to use the tools, consistent with the *EPA Policy on Consultation and Coordination with Indian Tribes*.

In addition, through its Indian Policy and other Agency-wide efforts, EPA continues to recognize the importance of tribal involvement in Agency decision-making. Several EPA Regions and programs also have developed specific procedures and plans describing EPA's expectations for tribal consultation and providing guidance designed to promote effective and efficient outreach to, and consultation with, tribal governments in appropriate situations. Such

---

> (a) all land within the limits of any Indian reservation under the jurisdiction of the United States Government, notwithstanding the issuance of any patent, and, including rights-of-way running through the reservation, (b) all dependent Indian communities within the borders of the United States whether within the original or subsequently acquired territory thereof, and whether within or without the limits of a state, and (c) all Indian allotments, the Indian titles to which have not been extinguished, including rights-of-way running through the same.

Although Indian country is a relevant geographic area for certain purposes and generally describes the area where EPA and authorized tribes, as opposed to states, would administer environmental programs under EPA's statutes, this document is intended to identify a variety of legal tools available to EPA to address environmental justice issues in any overburdened tribal communities, regardless of location, including Alaska Native communities located outside of Indian country.

[189] Presidential Memorandum on Tribal Consultation (Nov. 5, 2009). This memorandum is available at 74 Fed. Reg. 57881 (Nov. 9, 2009) and http://www.epa.gov/tribal/pdf/tribal-consultation-memorandum-09.pdf.

[190] EO 13175, entitled "Consultation and Coordination With Indian Tribal Governments," 65 Fed. Reg. 67249 (Nov. 9, 2000). Importantly, EPA's responsibilities under Executive Order 13175 are separate from the responsibilities under Executive Order 12898. The Agency's consideration of tribal interests and consultation with tribes under Executive Order 13175 stems from the federal government's special relationship with federally recognized tribes. Consistent with the scope of Executive Order 12898, the legal tools identified in this document are intended to address environmental justice issues involving a broader range of tribal communities, including communities of state-recognized and non-recognized tribes, and tribal communities living outside of Indian country, including in Alaska.

[191] The policy is available at http://www.epa.gov/tribal/pdf/cons-and-coord-with-indian-tribes-policy.pdf.

consultation is highly significant in helping to ensure appropriate tribal input in relevant EPA decision-making, and ultimately in the protection of human health and the environment in tribal communities.

TREATMENT IN A MANNER SIMILAR TO A STATE

I. EPA'S TAS PROCESS

As noted in Chapters One and Two, the Clean Air Act (CAA), Clean Water Act (CWA), and Safe Drinking Water Act (SDWA) all expressly provide for Indian tribes to play a role in protecting human health and the environment. These statutes allow, but do not require, tribes to seek to administer EPA environmental programs. Specifically, the statutes authorize EPA to approve tribal applications for eligibility to receive grants and carry out environmental programs. Such treatment enables tribes to protect human health and the environment in tribal areas in generally the same way that states do for areas outside of Indian country. In addition, EPA has interpreted the Toxic Substances Control Act (TSCA) and the Emergency Planning and Community Right-to-Know Act (EPCRA) – both of which are silent as to tribes – to authorize tribal roles within their areas. See Chapter Four. EPA also interprets the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) to authorize approval of certain tribal programs for the certification and training of applicators of restricted use pesticides. See Chapter Four. Moreover, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) provides that tribes shall be afforded substantially the same treatment as states for various specified provisions of the statute, including the provisions regarding notification of releases and consultation on remedial actions affecting a tribe or tribes. See Chapter Three.

As a general matter, EPA's statutes and regulations that authorize EPA to treat an Indian tribe as a state (TAS)[192] do so for eligible Indian tribes (*i.e.*, those that are federally recognized, have a governing body carrying out substantial duties and powers over a specific area, and are capable of carrying out the functions in a manner consistent with EPA's statutes and regulations). In addition, the statutes or regulations generally call for a jurisdictional showing for the relevant geographic area over which the tribe seeks to administer an environmental regulatory program.

[192] TAS terminology originates from existing language in the tribal provisions of certain EPA statutes and implementing regulations establishing the authority for EPA to approve tribal applications for eligibility to receive funding and administer environmental programs under federal laws. In 1994, EPA adopted and implemented a policy to discontinue the use of the term "treatment as a state" to the extent possible because the term is disfavored by federally recognized tribes and does not accurately reflect their unique legal status or relationship with the federal government, which is significantly different than that of states. 59 Fed. Reg. 64339 (Dec. 14, 1994) (commonly known as the TAS Simplification Rule). EPA believes that Congress did not intend to alter the unique federal/tribal relationship when it authorized treatment of tribes "as states;" rather, the purpose was to reflect an intent that tribes should assume a role in implementing EPA statues on tribal land comparable to the role states play on state land. *Id*. EPA continues to supports discontinuation of the term "treatment as a state." When its use is needed for clarity and consistency due to the term's statutory origin, EPA prefers to use the more accurate term "treatment in a manner similar to a state," which is also abbreviated "TAS." EPA continues to evaluate this terminology and to seek ways to better reflect the unique status of federally recognized tribes and the federal/tribal relationship by avoiding unnecessary comparisons to states.

There are, however, significant differences among the various TAS authorities. For instance, in some cases, the statutes differ in how they address the geographic extent of potential tribal programs. The CWA authorizes EPA to approve eligible tribal programs over reservation areas. Other statutes allow approval of programs over broader areas, including non-reservation areas of Indian country. EPA also interprets the statutes differently regarding demonstrations of tribal authority to carry out environmental regulatory functions. For example, EPA interprets the CAA TAS provision to constitute a delegation of authority by Congress to eligible tribes to manage air resources throughout their reservations. By contrast, EPA currently interprets the CWA and SDWA TAS provisions to require a demonstration of inherent tribal authority to regulate the relevant activities.

In addition, the statutes include some differences in the scope of available programs that tribes may apply to administer. For instance, the CWA identifies various statutory provisions for which EPA may treat eligible tribes similarly to states. They include: grants under CWA section 106, water quality standards under section 303, clean lakes under section 314, nonpoint source management under section 319, water quality certifications under section 401, the National Pollutant Discharge Elimination System (NPDES) program under section 402, and regulating the discharge of dredged or fill material into waters of the United States under section 404.[193] Similarly, the SDWA authorizes TAS for eligible tribes to exercise "primary enforcement responsibility for public water systems and for underground injection control," and to receive financial assistance to carry out those functions.[194] By contrast, the CAA authorizes TAS more generally and directs EPA to promulgate regulations specifying "those provisions of [the CAA] for which it is appropriate to treat Indian tribes as States."[195] EPA has promulgated such regulations at 40 C.F.R. Part 49; these regulations generally authorize eligible tribes to "be treated in the same manner as States with respect to all provisions of the Clean Air Act" with the exception of a few enumerated provisions largely relating to program submission or other requirements that EPA determined were not appropriate to impose on tribes.[196] See Chapter One.

EPA has promulgated regulations under its various statutes governing the process by which tribes may apply for TAS status as well as the procedures EPA will follow in taking action on tribal applications.[197] These regulations provide substantial detail to interested tribes regarding the information they should submit in their applications and generally call for EPA to process the applications in a timely manner. Generally, as discussed below, EPA may have the

capacity to streamline the TAS process for environmental regulatory programs, and efforts to this end are currently under way.

II. STEPS TO ENHANCE TAS

The statutory TAS provisions allow EPA some flexibility in determining how best to implement its authority to authorize tribes to administer federal programs. Thus, since EPA adopted its first TAS regulations, it has taken various steps to try to improve the process, both by simplifying the way it is administered under various programs and by revising its TAS regulations.

A. What EPA has Already Done

EPA has taken several steps to make the TAS process more robust, efficient, and effective. First, EPA has worked continuously to improve the TAS process since issuing its first TAS regulations in 1988. For instance, EPA's experience processing TAS applications led the Agency to issue a regulation revising and simplifying all of its then-existing TAS regulations in 1994. Under the simplified TAS process, EPA streamlined various procedures to eliminate duplicative requirements both in the preparation of tribal applications and also in the processing of those applications by EPA. EPA again refined the TAS process in 1998 and 2008 after convening workgroups to examine the Agency's continuing experience with tribal TAS applications and to identify potential additional efficiencies and areas where additional guidance would be useful. The latter process, which included significant consultation with tribal officials, culminated with the issuance of a formal TAS Strategy[198] designed to promote more efficient and transparent review of tribal TAS applications. The TAS Strategy provides important guidance regarding the information tribes should submit in their applications, describes practical and efficient procedures and timelines EPA intends to use to process the applications, and includes measures to help ensure accountability and appropriate sharing of information with applicant tribes.

In addition, EPA has generally attempted to interpret its statutory authority broadly to allow for tribal involvement in a wide variety of programs. For instance, as noted above, the CAA provided EPA with discretion to determine which provisions of the statute were appropriate for TAS. In implementing the CAA TAS regulations, EPA determined that all provisions of the statute were appropriate for TAS, with certain limited enumerated exceptions largely relating to provisions that would have inappropriately imposed requirements on, rather than affording opportunities to, tribal governments. Similarly, EPA has interpreted TSCA and EPCRA – which include no explicit reference to tribal roles – to authorize TAS for tribes to implement various roles under those statutes in their areas, including managing lead-based paint residential abatement programs under TSCA.[199]

Moreover, in addition to section 126 of CERCLA, which specifies certain provisions of the statute for which tribes shall be afforded TAS, EPA's National Oil and Hazardous

---

[198] Memorandum from Marcus Peacock, EPA Deputy Administrator, entitled "Strategy for Reviewing Tribal Eligibility Applications to Administer EPA Regulatory Programs" (Jan. 23, 2008). This memorandum, which refers to the TAS guidance memorandum issued on March 19, 1998, is available at http://www.epa.gov/tribal/pdf/strategy-for-reviewing-applications-for-tas-01-23-08.pdf.

[199] *See, e.g.*, 40 C.F.R. § 745.324.

Substances Pollution Contingency Plan (NCP) regulations under CERCLA define "State" to include Indian tribes "except where specifically noted" to the contrary[200] and establish eligibility criteria for tribes that want to carry out response actions under CERCLA section 104.[201] Further, as discussed in Chapter Four, the only explicit reference to tribes in FIFRA is in section 23 of the statute, which authorizes EPA to enter into agreements with tribes under the statute and to assist tribes with training and certification of applicators of certain pesticides. EPA has interpreted its authorities under FIFRA to allow tribes to submit their own plans to train and certify applicators of restricted use pesticides. Chapter Four also describes how EPA has implemented its authorities under FIFRA to take several steps to ensure that the statute's benefits are available to communities in Indian country. These include steps by EPA to directly implement programs in areas of Indian country to address emergencies and special local needs.

EPA has taken steps to enable tribes to seek TAS and implement approved programs without the need to demonstrate certain criminal enforcement authorities. The only statute that expressly provides that tribes do not need to exercise criminal authority to obtain TAS is SDWA section 1451(b)(2). The other statutes are silent on this issue, and EPA has used its discretion to issue regulations that enable the Agency to approve tribes for TAS notwithstanding limitations on tribal criminal enforcement authority.[202] In these cases, EPA's regulations generally call for the federal government to retain primary criminal enforcement authority and for the tribes to enter into agreements with EPA to provide investigative leads and otherwise assist in the development of criminal enforcement actions.

Further, in an effort to streamline TAS applications in situations where jurisdictional or land status issues may exist for only part of a particular tribe's application, EPA's regulations generally allow the Agency to approve an applicant tribe's TAS status for those areas where the jurisdictional scope of the tribe's application is undisputed.[203] Although the resulting TAS approval may be limited in geographic extent and may not address all areas covered by the tribe's application, this approach enables the tribe to assume a role for the approved area without the delays and uncertainties that may accompany resolution of jurisdictional or land status disputes. In any such situation, EPA would consult with the applicant tribe regarding the scope of the application and any EPA approval.

EPA's ability to approve tribal roles for certain programs faces statutory barriers. Notably, EPA was unsuccessful in defending a regulation authorizing TAS for tribes under the Resource Conservation and Recovery Act (RCRA). Although RCRA does not contain an explicit TAS provision, EPA attempted to exercise its discretion to provide a role for tribes similar to that of states for certain RCRA programs. Following a challenge to EPA's rule, the D.C. Circuit, relying on certain definitional language addressing tribes in RCRA, held that EPA

[200] 40 C.F.R. § 300.5.

[202] *See, e.g.*, 40 C.F.R. §§ 49.7(a)(6) and 49.8 (CAA regulations); 40 C.F.R. §§ 123.34, 233.41(f), and 501.25 (CWA regulations for, respectively, NPDES, section 404, and sewage sludge programs).

[203] *See, e.g.*, 40 C.F.R. § 49.9(e).

lacked authority to treat tribes as states under the current language of that statute.[204] The Court did recognize, however, EPA's authority to regulate under RCRA within Indian country.[205]

B. Further Steps to Enhance TAS

EPA believes that direct tribal involvement through the TAS process is an effective means of ensuring that the needs of tribal communities, and the uses those communities make of their environmental resources, are addressed during implementation of programs under EPA's statutes. Enhancing tribes' ability to obtain eligibility to administer these programs promotes environmental protection in Indian country, with significant emphasis on tribal sovereign decision-making and control of Indian country health and environments by the communities living there. EPA is, therefore, interested in additional steps the Agency may take to streamline the TAS process and thereby promote enhanced tribal involvement. EPA can, for instance, continue to review its TAS procedures on a national level as the Agency gains additional experience processing TAS applications in the context of the goals and expectations of the TAS Strategy described above.

In addition, EPA is considering whether it can reinterpret existing CWA TAS requirements in ways that would eliminate the need for tribes to show inherent authority over non-member activities for purposes of TAS for CWA regulatory programs. That would significantly streamline the TAS application and review processes, and could create an incentive for more tribes to seek TAS for EPA regulatory programs to protect tribal health and environments. Under EPA's current approach, some tribes may defer seeking TAS for CWA programs because of this inherent authority element. To demonstrate inherent authority, tribes sometimes need to present detailed factual showings relating to impacts of the regulated activities on the applicant tribe, including non-member activities on reservation land. Tribes have expressed concern over making these demonstrations, which are functioning for some tribes as a deterrent to seeking TAS status. As EPA recognized in the preamble to its final TAS regulations for the water quality standards (WQS) program, the CWA might be amenable to a different interpretation.[206] For example, EPA interprets the TAS provision in the CAA as a Congressional delegation to eligible tribes of authority over their entire reservations (including activities on non-member-owned fee lands) for CAA purposes. Under that delegation approach, tribes do not need to demonstrate inherent authority in order to obtain TAS status over their entire reservations. One federal district court judge stated, in dicta, that EPA could properly have construed the CWA TAS provision as a delegation of authority,[207] and a majority panel of a federal appeals court cited that statement favorably.[208] Moreover, as EPA acknowledged in the

[205] *Id.* at 153.

[206] 56 Fed. Reg. 64876, 64877-80 (Dec. 12, 1991) (discussing whether CWA section 518(e) could be construed to delegate to tribes authority to regulate water quality throughout reservations without further judicial or Congressional guidance).

[207] *Montana v. EPA*, 941 F. Supp. 945, 951 (D. Mont. 1996), *aff'd*, 137 F.3d 1135 (9th Cir.), *cert. denied*, 525 U.S. 921 (1998).

[208] *Arizona Public Service v. EPA*, 211 F.3d 1280, 1292 (D.C. Cir. 2000), *cert. denied sub nom. Michigan v. EPA*, 532 U.S. 970 (2001).

preamble to the final WQS regulations,[209] in a plurality opinion of the Supreme Court, Justice White cited CWA section 518(e) as an example of a Congressional delegation of authority.[210] EPA's interpretation of the CAA, which was upheld in a legal challenge,[211] has significantly streamlined many TAS applications under that statute. EPA is considering whether a similar interpretation is available under the comparable language of the CWA.

EPA is also considering whether for certain CWA programs, such as the WQS program, EPA could approve a tribal program without requiring the tribe to demonstrate that it has civil authority to regulate the environment. For instance, in submitting WQS for EPA review and approval, states must certify that the WQS were duly adopted pursuant to state law.[212] States are not, however, required to make a separate demonstration of regulatory authority over state waters or the activities of persons in their areas. EPA is considering whether it may be possible to reinterpret its existing WQS TAS regulations to reduce burdens on tribes by making the showing for tribal involvement more comparable to that of states. Such an approach, along with other similar efforts to streamline TAS procedures and requirements, may provide important opportunities to enhance tribes' ability to manage their environments through the TAS process.

Similarly, there may be opportunities for EPA to reconsider its prior interpretation of the SDWA TAS provision as it relates to a tribe's jurisdictional showing. Of course, any such approaches under the SDWA or CWA would need to be carefully analyzed in light of the existing statutory language and in the context of EPA's prior interpretations and programmatic needs.

EPA could also clarify its interpretation of some existing regulations to further the role of tribes. For example, CERCLA section 126(a) specifies that "[t]he governing body of an Indian tribe shall be afforded substantially the same treatment as a State" with respect to certain provisions of the statute, including consultation on remedial actions under CERCLA section 104(c)(2). As noted above, in Subpart F of the NCP regulations, EPA established criteria for TAS under CERCLA section 104, including the need for the tribe to have jurisdiction over a site at which a Fund-financed response is contemplated.[213] In view of the language in section 126(a) and the scope of section 300.515(a) of the NCP regulations, EPA could clarify whether this jurisdictional criterion is relevant for purposes of tribal consultation on remedial actions that affect them, as opposed to situations in which the tribe has the lead for conducting the response action. Similarly, EPA could clarify whether the jurisdictional criterion is relevant for purposes of entering into an EPA/State Superfund Memorandum of Agreement under 40 C.F.R. § 300.505 when the tribe is not the lead for the response action.

ALTERNATIVES TO TAS

As EPA has gained experience with its tribal programs, it has increasingly recognized that not all tribes are interested in assuming, or are able to assume, TAS. Indeed, EPA recognizes that there are other ways tribes can participate in the protection of their communities and environments. For example, EPA can provide financial assistance to tribes to develop their capacity for environmental management without the need to seek TAS for any particular program. The Tribal General Assistance Grant Program, which is discussed further in Chapter Seven, is one example. But EPA also recognizes that tribes can use program development grants under specific media statutes, like the CWA, to help them manage their environments without seeking TAS status for any regulatory program. Consistent with that approach, EPA developed a guidance document – "Final Guidance on Awards of Grants to Indian Tribes under Section 106 of the Clean Water Act" – that discusses measures tribes can take, using CWA development grant funds, to participate in managing reservation environments separate from the TAS process for regulatory programs.[214] The Guidance discusses both regulatory measures under tribal (rather than federal) law, and measures not involving the exercise of any regulatory authority that nevertheless enhance environmental protection.

Moreover, as an alternative to TAS under the CWA, tribes may seek to manage and protect reservation waters, including water bodies they share in common with states, by working cooperatively with states under CWA section 518(d). That provision authorizes tribes and states to enter into cooperative agreements, subject to EPA review and approval, to jointly plan and administer CWA programs. Its legislative history indicates that it was intended to create an alternative to TAS to protect reservation environments under the CWA.[215] Use of this authority has been very limited; there may be room for expanding use of this authority.

DIRECT IMPLEMENTATION

As discussed in other chapters, EPA can undertake direct implementation of human health and environmental programs in Indian country. In some cases, EPA may undertake implementation activities directly using Agency resources. In other situations, the Agency may work in conjunction with tribes under direct implementation cooperative agreements, which are described more fully in Chapter Seven.

Because very few tribes have as yet sought and been approved to administer environmental regulatory programs under EPA's statutes, the majority of environmental regulatory activity under federal laws in Indian country involves direct implementation by EPA. In most cases, therefore, EPA will be the entity with relevant authority to implement the various legal tools described in this document in Indian country. However, as described elsewhere, Indian tribes are sovereign entities exercising important powers over their members and areas, and those areas may include overburdened communities. In making decisions to advance environmental justice in overburdened tribal communities, EPA will remain respectful of tribal

[214] The guidance is available at http://water.epa.gov/grants_funding/cwsrf/upload/2006_10_20_cwfinance_final-tribal-guidance.pdf

[215] *See* 132 Cong. Rec. 32380, 32403 (1986).

governmental roles by, among other things, consulting with the relevant tribal governments on matters that affect them.

EPA currently implements a wide variety of environmental programs in Indian country. Some programs are specifically targeted to Indian country areas; others are national programs or requirements that apply in Indian country and elsewhere. EPA has used its rulemaking authority to implement environmental protection programs in Indian country. For example, EPA promulgated a Federal Implementation Plan for protection of air quality on the Indian Reservations in the States of Idaho, Oregon, and Washington; at the time of EPA's action, none of the tribes in those states had obtained TAS for CAA regulatory programs or established Tribal Implementation Plans. More broadly, EPA has recently issued regulations governing Review of New Sources and Modifications in Indian Country.[216] This rule for the first time establishes a regulatory framework for important elements of the New Source Review Program of the CAA in Indian country: *i.e.*, permitting for minor sources and for major stationary sources and major modifications in areas that are designated as not attaining the National Ambient Air Quality Standards. EPA continues to explore additional opportunities to implement programs in Indian country, including through rulemaking and other activities.

[216] 76 Fed. Reg. 38748 (July 1, 2011) (to be codified at 49 C.F.R. §§ 49.151-49.161 and 49.166-49.173, and Part 51, Appendix S).

CHAPTER SIX: ENVIRONMENTAL REVIEW PROGRAMS

INTRODUCTION

The National Environmental Policy Act (NEPA)[217] applies broadly to federal actions that may significantly affect the environment, and readily encompasses concerns raised by environmental justice, including impacts on the natural or physical environment and interrelated health, social, cultural, and economic effects.[218] Similarly, EPA has broad authority under section 309 of the Clean Air Act (CAA) to review and comment on other federal agencies' proposed regulations and actions that may significantly affect the environment.[219] Accordingly, the Presidential memorandum accompanying Executive Order 12898 emphasizes the importance of using the NEPA and CAA section 309 review processes to advance environmental justice. It directs federal agencies to "analyze the environmental effects, including human health, economic and social effects, of [their proposed] actions, including effects on minority communities and low-income communities, when . . . required by [NEPA]."[220] The memorandum calls for agencies to address significant adverse environmental effects on these communities in mitigation measures outlined or analyzed in environmental assessments, environmental impact statements, or records of decision.[221] It also directs EPA in its section 309 reviews to ensure that agencies fully analyze under NEPA the environmental effects, including human health, economic and social effects, of their proposed actions on minority communities and low-income communities.[222] NEPA and CAA section 309 are important tools for ensuring consideration and enhancing understanding of the environmental justice implications of federal actions across the entire Executive Branch.

Reflecting the importance EPA assigns to using NEPA as a tool in its efforts to promote environmental justice, EPA issued an April 19, 2011 memorandum entitled "Addressing Environmental Justice Through Reviews Conducted Pursuant to the National Environmental Policy Act and Section 309 of the Clean Air Act." The memorandum urges each EPA Regional Office, as well as Headquarters, to enhance Agency efforts to take environmental justice into account in their NEPA work. This includes fully utilizing EPA's authorities to advance environmental justice in the course of complying with NEPA under its own programs, as well as in connection with its review of other federal agencies' NEPA documents under CAA section 309.

[221] *Id*.

[222] *Id*.

NEPA

NEPA and its implementing regulations, including those of the Council of Environmental Quality (CEQ),[223] require federal agencies to consider the environmental effects of their proposed actions that are subject to NEPA. When proposing a major federal action significantly affecting the quality of the human environment, section 102(2)(C) of NEPA requires an agency to prepare an Environmental Impact Statement (EIS). An agency can prepare an environmental assessment (EA) to determine whether the effects are potentially significant, or can move directly to preparing a more detailed EIS. If in an EA an agency determines the proposal's effects will not be significant, the agency may complete its NEPA review with a "[f]inding of no significant impact."[224]

In preparing EISs, NEPA and CEQ's implementing regulations direct federal agencies, including EPA, to establish a pre-EIS scoping process;[225] analyze the environmental effects of the proposed action; discuss all reasonable alternatives (including those outside the agency's jurisdiction) and the alternative of no action; identify practicable mitigation[226] not covered in the alternatives discussion; and provide for meaningful public participation. Because of statutory and judicially created exemptions, NEPA generally applies only to a limited number of EPA program activities, such as when EPA issues new source NPDES permits, conducts certain types of research, or constructs facilities. However, EPA may prepare voluntary EISs or EAs for its NEPA-exempt actions under its "Statement of Policy for Voluntary Preparation of National Environmental Policy Act (NEPA) Documents," and the criteria for doing so include "the potential for using an EA or an EIS to facilitate analysis of environmental justice issues . . . and to expand public involvement . . . ."[227] To help ensure that EPA fully considers environmental justice in its NEPA reviews, in 1998 EPA issued its *Guidance for Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses*.[228] This guidance suggests that the EPA NEPA analyst may approach the analysis of environmental justice from three vantage points: whether there exists a potential for disproportionate risk, whether communities have been

---

[223] 40 C.F.R. Parts 1500-1508.

[224] 40 C.F.R. § 1508.13.

[225] CEQ and EPA guidance emphasizes the importance of public participation in the scoping process. *See* CEQ's *Environmental Justice: Guidance Under the National Environmental Policy Act* (Dec. 10, 1997) at 10-13 and EPA's *Guidance for Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses* (April 1998) at 4.0 – 4.1. *See also* 40 C.F.R. §§ 1501.7 and 6.203(a)(2).

[226] Pursuant to 40 C.F.R. § 1508.20, the term "[m]itigation" includes:

> (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
> (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
> (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
> (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
> (e) Compensating for the impact by replacing or providing substitute resources or environments.

[227] *See* 63 Fed. Reg. 58045, 58046 (Oct. 29, 1998), which is available at http://frwebgate.access.gpo.gov/cgi-bin/getdoc.cgi?dbname=1998_register&docid=98-29019-filed.pdf.

[228] The guidance is available at: http://www.epa.gov/environmentaljustice/resources/policy/ej_guidance_nepa_epa0498.pdf.

sufficiently involved in the decision-making process, and whether communities currently suffer, or have historically suffered, from environmental and health risks or hazards.[229] EPA also follows the 1997 guidance on this subject issued by CEQ, entitled *Environmental Justice: Guidance Under the National Environmental Policy Act*.[230]

For purposes of environmental justice, when NEPA applies and the Agency prepares an EA or EIS, EPA's NEPA regulations,[231] policy, and guidance call for EPA to: (1) examine the direct and indirect effects of the EPA action on minority, low-income, and indigenous populations, including health impacts and socio-economic impacts that are interrelated to effects on the physical environment; (2) analyze, from an environmental justice perspective, the cumulative impact of the EPA action when added to other past, present, and reasonably foreseeable future activities (federal and non-federal); (3) analyze reasonable alternatives that address environmental justice impacts; (4) consider mitigation measures to address impacts on minority, low-income, and indigenous populations; and (5) provide for public review and comment on the draft EIS or EA, including the discussion of environmental justice issues.

Under NEPA, EPA may consider in an EA or EIS environmental factors that are not expressly set forth in its organic statutes, regulations, or guidance. Courts have held that NEPA, which is a procedural statute, does not expand the scope of an agency's regulatory jurisdiction. Nonetheless, federal agencies can use the NEPA process to inform how they exercise their discretion. For example, where an agency's organic authority allows for two (or more) possible approaches to an issue, a NEPA environmental justice analysis may be used to inform the choice of which approach to take. Similarly, an environmental justice analysis may help an agency identify an approach under its organic authority that it might not otherwise have considered.

---

[229] *Id*. at 2.3.

[230] The CEQ guidance at 8-9 includes the following general principles for considering environmental justice under NEPA:

- Consider the composition of the affected area to determine whether minority, low-income, or tribal populations are present, and if so whether there may be disproportionately high and adverse human health or environmental effects on these populations.
- Consider relevant public health and industry data concerning the potential for multiple exposures or cumulative exposure to human health or environmental hazards in the affected population, as well as historical patterns of exposure to environmental hazards.
- Recognize the interrelated cultural, social, occupational, historical, or economic factors that may amplify the natural and physical environmental effects of the proposed action.
- Develop effective public participation strategies.
- Assure meaningful community representation in the process, beginning at the earliest possible time.
- Seek tribal representation in the process.

The CEQ guidance is available at http://ceq.hss.doe.gov/nepa/regs/ej/justice.pdf.

[231] 40 C.F.R. Part 6.

CLEAN AIR ACT SECTION 309

Under section 309(a) of the CAA, EPA is required to review and comment on the environmental impacts of the actions of other federal agencies, including proposed regulations and projects subject to the EIS requirement in section 102(2)(C) of NEPA. In addition, pursuant to CAA section 309(b), if EPA determines, as a result of its review, that a particular activity is unsatisfactory from the standpoint of public health, welfare, or environmental quality, it must publish the determination and refer the matter to CEQ for resolution.[232] Consistent with the President's memorandum accompanying Executive Order 12898, and because of the clear linkage between environmental justice and the stated criteria for an EPA referral to CEQ, EPA may readily use the CAA section 309 review process to ensure that other federal agencies fully analyze and address, as appropriate, the environmental effects, including human health, social, and economic effects, of their proposed actions on minority, low-income, and indigenous populations.

To help advance environmental justice through this review process, EPA issued its *Guidance for Consideration of Environmental Justice in Clean Air Act Section 309 Reviews* (July 1999).[233] The guidance covers how to consider environmental justice at each stage of the CAA section 309 review process. It addresses pre-environmental-review activities, identifying minority and low-income populations, potential impacts, review of draft EISs, public participation, alternatives, mitigation,[234] ratings, and review of final EISs. Under the CAA section 309 review process, EPA reviews and comments on a wide variety of federal projects with significant environmental impacts. In its comment letters to sister agencies, EPA routinely raises environmental justice issues, including those related to the nature of impacts on minority, low-income, or indigenous communities; the thoroughness of the analysis; and identification of alternatives or mitigation to address the impacts.

In July 2011, EPA issued guidance that is designed to help other federal agencies and states, among other things, to account for environmental justice considerations in the context of mountaintop mining, with a specific discussion on the opportunities afforded by NEPA.[235] The guidance recommends, among other things, that EPA Regional Offices encourage agencies "to make the full range of NEPA notices and documents, including draft EAs, readily available to the public" and "to improve the accessibility of public meetings." This illustrates how EPA can play an important role, consistent with NEPA, to advance environmental justice through

---

[232] *See* CEQ's regulations at 40 C.F.R. Part 1504 for the procedures on referrals.

[233] The guidance is available at: http://www.epa.gov/compliance/resources/policies/nepa/enviro_justice_309review.pdf.

[234] *See EPA Guidance for Consideration of Environmental Justice in Clean Air Act Section 309 Reviews* (July 1999) at 2.3.5, which provides that mitigation measures should be developed specifically to address potential disproportionately high and adverse effects to minority and/or low-income communities. Similarly, the action agency, with tribal concurrence, should select mitigation measures that will not diminish tribal resources and that will ensure the protection of such resources from environmental harm.

[235] *See* "Improving EPA Review of Appalachian Surface Coal Mining Operations under the Clean Water Act, National Environmental Policy Act, and the Environmental Justice Executive Order" (July 21, 2011), which is discussed in Chapter Two.

transparency and open government as well as comprehensive consideration of the environmental impacts through an effective environmental justice analysis.

CHAPTER SEVEN: GRANTS AND PROCUREMENT

EPA AUTHORITY TO ADDRESS ENVIRONMENTAL JUSTICE THROUGH ASSISTANCE AGREEMENTS AND OTHER FINANCIAL MECHANISMS

I. GRANTS FOR ENVIRONMENTAL JUSTICE PROJECTS

EPA manages an environmental justice grants program[236] that provides financial assistance to eligible organizations working on or planning to work on projects to address local environmental and/or public health issues in their communities.[237] The program also provides financial assistance to eligible organizations to build collaborative partnerships, to identify the local environmental and/or public health issues, and to envision solutions and empower the community through education, training, and outreach.[238] The Agency's statutes authorize these grants, which provide assistance for demonstrations, research, surveys, and training. Eligible environmental justice activities include:

(1) Demonstrations or analysis of environmental justice conditions and problems (for example, socio-economic impact studies);

(2) Projects to research specific local environmental justice issues; and

(3) Environmental justice training or education for community residents, teachers, or related personnel.

II. RESEARCH, DEVELOPMENT, AND TRAINING GRANTS UNDER ENVIRONMENTAL STATUTES

The Environmental Justice Grant Program implements statutes that give EPA broad authority to support activities including research, development, training, surveys, investigations, and demonstrations related to pollution of particular environmental media.[239] For example, Clean Water Act section 104(b)(3) authorizes EPA to make grants for activities related to water pollution to state agencies, other public or nonprofit private organizations, and individuals. Similarly, consistent with EPA's competition policy, EPA could make a grant under Solid Waste Disposal Act section 8001(a) to a community association for a survey of health and welfare

[236] The term "grants" as used in this chapter includes cooperative agreements as well as grants. Both are assistance agreements; they differ only in the extent of Agency involvement in the project.

[237] *See* Environmental Justice Collaborative Problem-Solving Cooperative Agreement Program at http://www.epa.gov/environmentaljustice/grants/ej-cps-grants.html.

[238] *See* Environmental Justice Small Grants Program at http://www.epa.gov/environmentaljustice/grants/ej-smgrants.html.

[239] The authorities under which these environmental justice grants will be awarded are: Clean Water Act (CWA) section 104(b)(3), Safe Drinking Water Act (SDWA) section 1442(b)(3), Solid Waste Disposal Act (SWDA) section 8001(a), Clean Air Act (CAA) section 103(b)(3), Toxic Substances Control Act (TSCA) section 10(a), Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) section 20(a), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) section 311(c), and Marine Protection, Research, and Sanctuaries Act (MPRSA) section 203.

effects of a local landfill. The authority to fund these "research and demonstration" activities is well established. Projects funded under these authorities and other EPA authorities have the potential to make a significant impact in identifying issues of environmental justice concern and establishing a foundation for developing corrective actions. The Agency must comply with the Office of Management and Budget (OMB) regulations implementing the Paperwork Reduction Act when funding any information-gathering activities under such a grant.

III. SUPERFUND TECHNICAL ASSISTANCE GRANTS

CERCLA section 117(e) authorizes EPA to make Technical Assistance Grants (TAGs) of up to $50,000 to groups of individuals affected by Superfund sites. TAGs help communities obtain technical assistance from independent experts who can interpret site information to promote better understanding of a site and more meaningful public participation in the clean-up decision-making process. TAGs are subject to most Agency-wide general grant regulations, but often with less formal requirements. TAGs are based on an established legal mechanism for providing assistance to communities impacted by Superfund sites. TAGs awarded to eligible minority, low-income, or indigenous populations advance environmental justice by providing those groups with information that would enable them to participate in the environmental decision-making process.

IV. NATIONAL AND COMMUNITY SERVICE ACT

Under the 1993 amendments to the National and Community Service Act,[240] EPA and other federal agencies may enter into interagency agreements with the Corporation for National and Community Service (the Corporation) for service programs that address established priorities: the environment, public safety, human needs, and education. Agencies may use these funds to implement their own programs or to enter into contracts or cooperative agreements with entities that are carrying out national service programs in the States. EPA can consult with the Corporation about the availability of funding under this authority, and, if available, seek to enter into interagency agreements for projects that advance environmental justice.

V. NATIONAL ENVIRONMENTAL EDUCATION ACT

Section 6 of the National Environmental Education Act[241] authorizes EPA to award grants for projects to design, demonstrate, or disseminate practices, methods, or techniques related to environmental education and training. EPA is authorized to support projects that address environmental issues which, in the judgment of the Administrator, are of high priority; these could include projects that advance environmental justice. EPA annually solicits applications for section 6 grants from local education agencies, colleges and universities, state education and environmental agencies, nonprofit organizations, and noncommercial educational broadcasting entities. Each recipient must meet a 25 percent cost-sharing requirement. No grant awarded under section 6 may exceed $250,000, and 25 percent of the funds awarded under this provision each year must be for grants of not more than $5,000.

[240] 42 U.S.C. § 12571.

[241] 20 U.S.C. § 5505.

VI. ASSISTANCE AGREEMENTS WITH TRIBAL GOVERNMENTS

As discussed in Chapter Five, enhancing tribes' ability to manage their lands and to participate and assist in the implementation of environmental programs typically will advance environmental justice and help them address concerns they may have.

A. Assistance Available to Tribes

Some of EPA's organic statutes that authorize EPA to provide assistance to states also authorize the Agency to award assistance to federally recognized tribal governments. EPA awards environmental program grants to tribes under CAA section 105 (air pollution control), CWA sections 106 and 108 (water pollution control), CWA section 104(b)(3) (water quality cooperative agreements; wetlands development grants), CWA sections 319(h) and 518(f) (nonpoint source management grants), FIFRA section 23(a)(1) and (2) (pesticide cooperative enforcement; pesticide program implementation; and pesticide applicator certification and training), PPA section 6605 (pollution prevention grants), SDWA sections 1433(a), (b) and 1451 (public water system supervision; underground water source protection), TSCA section 404(g) (lead-based paint program), TSCA section 306 (indoor radon grants), TSCA section 28 (toxic substances compliance monitoring), Public Law 105-276 (hazardous waste management program grants; underground storage tank program grants), and CERCLA section 128(a) (tribal response program grants). Regulations governing these assistance agreements may be found in 40 C.F.R. Part 35, Subpart B. In addition to these grant programs, tribes are also eligible for Superfund Cooperative Agreements under CERCLA section 104(d) that are awarded and administered in accordance with 40 C.F.R. Part 35, Subpart O (EPA's Superfund response action grant regulations applicable to state, local, and tribal governments).

B. Indian Environmental General Assistance Program Act

The Indian Environmental General Assistance Program Act of 1992 (IEGAPA)[242] authorizes EPA to make grants to Indian tribes to build capacity to administer environmental protection programs on Indian lands. New General Assistance Program (GAP) grants under the IEGAPA must be for at least $75,000 and the term of an award may not exceed four years. GAP grants are awarded non-competitively.

C. Direct Implementation Tribal Cooperative Agreements

EPA's annual appropriations act typically authorizes EPA to enter into Direct Implementation Tribal Cooperative Agreements (DITCAs) with federally recognized Indian tribes or intertribal consortia to assist EPA in implementing federal environmental programs required or authorized by law in the absence of an acceptable tribal program. EPA works closely with tribes to identify DITCA-eligible activities and to determine those direct implementation activities where there is a joint tribal and EPA priority for program implementation. DITCAs are awarded non-competitively.

D. Indian Self-Determination Act Preference

The Indian Self-Determination Act requires tribal grantees to give preference and opportunities in the award of contracts, subcontracts, and subgrants to Indians.[243]

---

[242] 42 U.S.C. § 4368b.

[243] *See* 40 C.F.R. § 31.38.

VII. BROWNFIELDS REVITALIZATION FUNDING

The Brownfields revitalization funding authority under CERCLA section 104(k) authorizes EPA to, among other things, make grants for site characterization, assessment, and cleanup, as well as for the capitalization of revolving loan funds for remediation of Brownfield sites. The statute also authorizes EPA to provide, or support with financial assistance, Brownfields-related research, training, and technical assistance. Eligibility for grants for site characterization, assessment, and capitalization of revolving loan funds is limited to governmental entities or certain types of quasi-governmental organizations that are connected to governments.

In authorizing the Agency to make grants under this authority, CERCLA directs the Administrator to establish a system for ranking grant applications. The statute contains ten ranking criteria, including the extent to which a grant would address or facilitate the identification and reduction of threats to the health or welfare of children, pregnant women, minority or low-income communities, or other sensitive populations; the extent to which a grant would address or facilitate the identification and reduction of threats to human health and the environment, including threats in areas in which there is a greater-than-normal incidence of disease or conditions that may be associated with exposure to hazardous substances, pollutants, or contaminants; and the extent to which a grant would meet the needs of a community that is unable – because of the small population or low income of the community – to draw on other sources of funding for environmental remediation and subsequent redevelopment of the area in which a Brownfield site is located.

VIII. GRANT CONDITIONS

A. Conditions Related to Goals of the Statute

EPA may place conditions on any grant award if the conditions are directly related to the goals of the statute authorizing the award.[244] In *Shanty Town Associates Ltd. Partnership v. EPA*, the court held that EPA acted within its CWA authority in conditioning a Title II grant to a municipality for construction of a sewage collection system. EPA's environmental impact statement found that the new sewage system would induce development and therefore increase nonpoint source pollution from the area served. The Agency inserted in the grant to the city a condition limiting the use of the new system to existing development. A developer challenged the condition on the ground that it was not related to the purpose of the grant, which was sewage treatment works construction, not land use control or nonpoint source management. The court held that, although CWA Title II does not mention use limitations, EPA had authority to impose them as a condition because they were directly related to the goals of the CWA.

EPA may consider including in appropriate grants special conditions aimed at advancing environmental justice. Grants that might be appropriate for such a condition include, but are not limited to, National Estuary Program grants under CWA section 320(g), state/tribal cooperative agreements under CERCLA section 104, and state continuing environmental program grants.[245] However, any condition should be written in terms of implementing a goal of the act authorizing

[244] *Shanty Town Associates Ltd. Partnership v. EPA*, 843 F.2d 782 (4th Cir. 1988).

[245] Continuing environmental program grants are awarded under CWA sections 106 and 319, SDWA section 1443, SWDA section 3011, CAA section 105, TSCA section 28, and FIFRA section 23.

the grant. Indeed, the more closely aligned the grant condition is to the statutory goals the more legally defensible the condition will be. For example, a condition requiring the grantee to consider cumulative impacts, unique exposure scenarios, or sensitive populations would arguably be directly related to a statute's goal of protecting human health.

One avenue EPA could use to ensure that environmental justice considerations are considered in determining the activities to be funded under state and tribal environmental program grants is to include environmental justice in the national goals, objectives, and priorities of each program as expressed through the National Program Guidance. Including environmental justice in the National Program Guidance for each program would provide EPA with a basis for negotiating activities into recipient work plan commitments. National Program Guidance is an appropriate means to provide a framework for addressing environmental justice considerations in each program and each award because work plans should reflect program priorities outlined in the National Program Guidance.[246] And, by signing the grant documents, the grant recipient will have expressly accepted the conditions imposed by the terms of the grant.

If a condition or program priority can be said to implement the underlying statute rather than Title VI of the Civil Rights Act (see discussion of Title VI below), EPA could seek to enforce the condition through the remedies and disputes process under the general grant regulations,[247] rather than under EPA's recipient anti-discrimination regulations.[248] The procedures under the grant regulations, which are described below, are simpler and allow for more informal, faster action than the procedures under Title VI regulations.

B. Environmental Justice in Evaluation Criteria

Each Request for Proposals (RFP) issued in competitive grant programs contains an explanation of the evaluation criteria the Agency uses to evaluate the merits of each applicant's grant proposal. Where appropriate, EPA could incorporate environmental justice considerations into its stated evaluation criteria. Any evaluation criteria included in an RFP should be consistent with the goals of the act authorizing the grant and must be consistent with any evaluation criteria stated in that act.[249] Environmental justice considerations incorporated into evaluation criteria may be reflected in the terms and conditions of the grant award, as appropriate.

C. Conditions for High-Risk Grantees

The general grant regulations at 40 C.F.R. § 31.12 allow EPA to impose certain conditions or restrictions on a "high-risk" recipient during the pre-award stage of the grants process. A recipient or subgrantee may be considered high risk if EPA determines, for example, that it has a history of unsatisfactory performance, has not conformed to terms and conditions of previous awards, or is otherwise not responsible. Special conditions or restrictions may include withholding authority for advance payments, or withholding authority to proceed to the next phase before receipt of evidence of acceptable performance within a given funding period;

[246] 40 C.F.R. §§ 35.107 and 35.507.

[247] 40 C.F.R. Parts 30 and 31.

[248] 40 C.F.R. Part 7.

[249] *See, e.g., Ill. Environmental Protection Agency v. EPA*, 947 F.2d. 283 (7th Cir. 1991).

additional project monitoring; or requiring the recipient or subgrantee to obtain technical or management assistance. As a short-term measure the Agency could consider identifying recipients as high-risk when there is evidence of current or past practices that are inconsistent with environmental justice principles, *e.g.*, those reflected in the Title VI regulations or Executive Order 12898. The Agency would need to make a determination of whether a high-risk designation is appropriate through information gathered in a pre-award review, an audit of the recipient's past performance, or using other available information. In this case, EPA might impose a special condition on subsequent grants establishing special requirements for such recipients.

D. Disadvantaged Business Enterprises

EPA promotes nondiscrimination in the award of contracts under EPA financial assistance agreements through its regulations at 40 C.F.R. Part 33. Financial assistance recipients are required to make good faith efforts to meet negotiated fair share objectives for disadvantaged-business-enterprise participation in procurement under financial assistance agreements. Disadvantaged business enterprises include, but are not limited to, businesses owned or controlled by African-Americans, Hispanic Americans, Native Americans, Indian Tribes, Asian Pacific Americans, Native Hawaiian organizations, women, and Historically Black Colleges and Universities. Each procurement contract signed by an EPA financial assistance agreement recipient must include a term and condition that incorporates the requirements of Part 33.

IX. REMEDIES FOR NON-COMPLIANCE WITH GRANT CONDITIONS

A. Remedies

EPA's regulations establishing administrative requirements for grants to states, local governments, and Indian tribes are found at 40 C.F.R. Part 31. Similar regulations governing grants to all other recipients are found at 40 C.F.R. Part 30. Under both regulations, if a recipient materially fails to comply with any term or condition of a grant agreement, EPA may take one or more of the following actions:[250]

(1) issue a stop-work order;

(2) withhold payments;

(3) suspend or terminate the agreement;

(4) annul the agreement, wholly or partly, and recover all awarded funds (Part 30 or Part 31, as appropriate, sets forth grounds for annulment);

(5) withhold further awards for the program; and

(6) seek other remedies legally available.

[250] *See* 40 C.F.R. §§ 30.63 and 31.43, as applicable.

B. Disputes

Grant recipients and applicants that wish to dispute an Agency action, including a decision to take one of the remedial actions listed above, may pursue the administrative dispute resolution process set forth in the regulations at 40 C.F.R. Part 30, Subpart C, and 40 C.F.R. Part 31, Subpart F.[251] Persons other than a grant applicant or recipient may not bring a dispute challenging a grant action under these regulations, although they may informally petition the Agency. The dispute resolution process seeks to resolve matters through a relatively simple and informal EPA management review. A disputant under these regulations may submit documentary evidence and briefs for inclusion in a written record, is entitled to an informal conference with EPA officials, and is entitled to a written decision from the appropriate EPA Dispute Decision Official (DDO). Upon request for review of a DDO decision, a disputant is entitled to a written decision from the appropriate Regional Administrator (RA) or Assistant Administrator (AA). An RA's decision may be reviewed by the appropriate AA, at the discretion of the AA. If the AA decides not to review the RA's decision, the RA's decision is the final agency action.

NON-DISCRIMINATION IN FEDERAL ASSISTANCE PROGRAMS

I. INTRODUCTION

EPA implements Title VI of the Civil Rights Act of 1964, section 504 of the Rehabilitation Act of 1973, section 13 of the Federal Water Pollution Control Act Amendments of 1972, Title IX of the Education Amendments of 1972, and the Age Discrimination Act of 1975, which prohibit discrimination based on race, color, national origin, disability, sex, and age. Regulations at 40 C.F.R. Part 7, entitled "Nondiscrimination in Programs or Activities Receiving Federal Assistance from EPA," include general and specific prohibitions against intentional and unintentional (*i.e.*, disparate effects) discrimination by EPA's assistance recipients on the basis of race, color, national origin, sex, or handicap.[252] Every EPA grant recipient, including almost every state environmental agency, is subject to the terms of Part 7.[253]

EPA enforcement of these anti-discrimination provisions can be a tool in the Agency's efforts to address discrimination and advance environmental justice. In particular, the Presidential memorandum accompanying Executive Order 12898 identifies Title VI as an important tool to help achieve the goal of environmental justice. The memorandum directs federal agencies to ensure that recipients of federal financial assistance do not discriminate based on race, color, or national origin under Title VI in their programs or activities that affect human

[251] The dispute resolution procedures in Part 31, Subpart F, apply to states, local governments, and Indian tribes. Those in Part 30, Subpart C, apply to all other applicants and recipients. The procedures in the two regulations are virtually the same.

[252] The procedures outlined in Part 7 have been adopted by the Part 5 regulations with respect to complaints of sex discrimination in education programs or activities. *See* 40 C.F.R. § 5.605.

[253] In implementing the *Plan EJ 2014* goal of supporting community-based programs, EPA intends to develop language for environmental justice principles, including Title VI guidance (as appropriate with all Agency grants), for inclusion in the FY2011 National Environmental Performance Partnership System and National Program Manager guidance.

health or the environment. Further, Title VI's prohibition against discrimination applies to all the programs and activities of a recipient of federal assistance, including EPA assistance. Because "program or activity" is defined to include all the operations of recipients of EPA assistance, including state or local departments or agencies, the applicability of the Part 7 regulations is very broad.

EPA's Office of Civil Rights (OCR) is responsible for implementing Part 7.[254] EPA is now focused on investigating and resolving the large number of pending Title VI complaints, some of which have been pending in EPA for a number of years. As those complaint investigations are completed, EPA will expand its foundation of decisions and policies upon which consistent, aggressive Agency enforcement activities, as described below, can be based.

II. PRE-AWARD COMPLIANCE

Before EPA awards assistance (grants or cooperative agreements, in most cases), it is required to determine whether the applicant is in compliance with Part 7.[255] To obtain the information necessary to make that determination, EPA requires applicants to submit notice of any pending lawsuits alleging discrimination, any civil rights compliance reviews regarding the applicant conducted during the two-year period before the application, the name and title of its compliance coordinator, and a copy of the applicant's grievance procedures, if any.[256] In addition, applicants may be required to submit any other information that EPA determines is necessary to make the pre-award compliance determination.[257]

EPA could revise the application form to request additional information that could help identify potential civil rights concerns related to the grant applicant. For example, applicants could be required to provide information regarding the applicant's resources, policies, and practices for addressing discrimination. The process for revising the form would include OMB approval and would entail relatively minor cost and resources. A more significant expansion of the pre-award compliance review process, however, would warrant close coordination (including Standard Operating Procedures) within EPA in order to avoid major disruptions and delays in the grant application review and approval process.

In addition, applicants for EPA assistance must submit an assurance with their applications that, with respect to their programs or activities that receive EPA assistance, they will comply with the non-discrimination provisions in Part 7.

III. POST-AWARD COMPLIANCE

The Agency may periodically conduct reviews of any assistance recipient's programs or activities to ensure compliance with Title VI. These compliance reviews may include information and data requests. They may also include on-site reviews when EPA has reason to believe that discrimination may be occurring in those programs or activities.[258] EPA could

[254] *See* 40 C.F.R. §§ 1.25(b)(5) and 7.20(a).

[255] 40 C.F.R. § 7.110(a).

[256] *See* EPA Form 4700-4.

[257] 40 C.F.R. § 7.110(a).

[258] 40 C.F.R. § 7.115.

expand its compliance review program in a number of ways. Part 7 requires recipients to collect, maintain, and, upon request, provide EPA with a description of any pending lawsuits against the recipient alleging discrimination; racial/ethnic, national origin, sex, and handicap data; a log of discrimination complaints; and reports of any compliance reviews conducted by other agencies.[259]

EPA could increase the frequency and/or regularity with which it requests compliance review information from recipients. That information could be reviewed to determine if a more comprehensive compliance review is necessary. In addition, EPA could establish criteria for selecting targets for compliance reviews that further the Agency's environmental justice goals. EPA could also expand the scope of its compliance reviews beyond the procedural requirements in the regulations to include any recipient activity that the Agency believes may raise Title VI concerns. Currently, the compliance reviews are generally limited to ascertaining whether the recipient is in compliance with the procedural requirements contained in Part 7 (*i.e.*, whether the recipient has a grievance procedure and compliance coordinator). Part 7 requires most recipients to adopt grievance procedures to assure prompt and fair resolution of complaints of discrimination. EPA could more heavily scrutinize recipients' grievance procedures and, where inadequate, assist them in developing such procedures. This would help provide complainants with another avenue of redress, and recipients would be better able to resolve concerns in-house, thereby potentially reducing the number of Title VI complaints filed with EPA.

Expansion of the current compliance review program has the potential to have greater impact than what is accomplished through complaint investigations (where existing resources are principally spent) because the scope of compliance reviews could be broader than that of complaint investigations. EPA's regulations already provide the authority to implement this change. However, a significantly more robust compliance review program would require substantial additional resources.

IV. COMPLAINT INVESTIGATIONS

Any person who believes that he or she or a specific class of persons has been discriminated against in violation of Part 7 may file a complaint with any EPA office within 180 days of the alleged discrimination. For claims of unintentional discrimination under EPA's Title VI regulations, the administrative complaint process is the only available forum for relief because Title VI complaints filed in federal courts are limited to claims of intentional discrimination.

EPA could do more outreach to educate the public on using Title VI to address issues of discrimination in their communities. This outreach could potentially have a significant impact in that it could improve the quality of Title VI complaints and bring additional issues of discrimination to EPA's attention. Such a program could be established internally, relying on Standard Operating Procedures to maintain consistency. Initially, such outreach would require significant effort, in that educational materials would need to be developed. Ongoing educational efforts, however, would require less effort to maintain.

[259] 40 C.F.R. § 7.85.

EPA's regulations at 40 C.F.R. § 7.120 require that the complaint meet the minimum jurisdictional criteria to be accepted. First, the complaint must be in writing. Second, it must be filed within 180 days of the alleged discriminatory act. Third, it must allege discrimination based on race, color, or national origin. Finally, it must identify a recipient of EPA assistance alleged to have committed discriminatory acts. EPA must investigate accepted complaints and will either dismiss complaints where no violation is found, attempt to resolve complaints informally, as described below, or make a finding of violation. Investigations are often resource-intensive and time-consuming. EPA could make more use of alternative dispute resolution (ADR) processes to resolve complaints more efficiently and effectively. The Agency may call on its own trained mediators and environmental experts, as well as external ADR professionals, to facilitate this process and perhaps resolve some Title VI issues more quickly and collaboratively.

The increased and systematic use of ADR to resolve Title VI issues could potentially have a significant impact by addressing potential discrimination issues without EPA using the resources required for a full complaint investigation. Because EPA's regulations already reference the informal resolution of complaints, such a program could be established internally, without the need for additional regulations or guidance. OCR has started to expand the use of ADR and has worked with EPA's Conflict Prevention and Resolution Center (located within the Alternative Dispute Resolution Law Office) to have mediators "on call" to assist with informal resolution of Title VI complaints.

V. ACTIONS AVAILABLE TO OBTAIN COMPLIANCE

If informal resolution efforts fail, EPA will notify the recipient of its preliminary findings and make recommendations for achieving voluntary compliance. Where a preliminary determination of noncompliance does not result in voluntary compliance, EPA must issue a formal determination of noncompliance with a requirement that the recipient come into voluntary compliance within 10 calendar days. If resolution and voluntary compliance are not successful, the Agency may use any means authorized by law to obtain compliance, including referral of the matter for enforcement to the U.S. Department of Justice. If EPA pursues litigation, the objective would likely be to obtain injunctive relief to end or mitigate the discrimination.

EPA may also choose to begin proceedings to annul, terminate, refuse to award, or refuse to continue assistance. The proceedings may, at the request of the applicant or recipient, include a hearing before an administrative law judge (ALJ). The ALJ's determination becomes the Administrator's final decision in the event the applicant or recipient does not file exceptions to the ALJ's determination. In cases of review by the Administrator, all parties may submit written statements. If the Administrator's decision is to deny an application, or annul, suspend or terminate assistance, the decision does not become final until 30 days after she submits a full written report of the circumstances and grounds for the action to the House and Senate committees having legislative jurisdiction over the EPA program involved. The Administrator's decision is not subject to review under the general grant regulations.

PROCUREMENT TOOLS FOR ADDRESSING ENVIRONMENTAL JUSTICE

I. INTRODUCTION

There are various statutory and regulatory procurement authorities that EPA could utilize to advance environmental justice. There are several existing government-wide policies designed to provide "maximum practicable opportunities" in the award of contracts and subcontracts to small business concerns owned by "socially and economically disadvantaged" groups as well as businesses located in areas of high unemployment. These existing government policies are included in the Federal Acquisition Regulation (FAR),[260] which regulates agencies' procurement of supplies and services.

EPA could use these existing policies to help provide economic empowerment to communities that have traditionally had environmental justice issues.

EPA could also seek to advance environmental justice in its procurements through the incorporation of environmental justice tasks in procurement statements of work and environmental justice considerations in evaluation criteria.

II. EXISTING PROCUREMENT MECHANISMS THAT COULD BE USED TO PROMOTE ENVIRONMENTAL JUSTICE

FAR 19.201 expresses the policy that "maximum practicable opportunities" be directed towards small disadvantaged business concerns and small business concerns located in Historically Underutilized Business Zones. See Section II.C below.

A. The "8(a)" Program

Section 8(a) of the Small Business Act authorizes the Small Business Administration (SBA) to enter into contracts with other federal agencies and to perform those contracts by subcontracting to "socially and economically disadvantaged small business concerns."[261] Such entities are small businesses if: (1) they are at least 51 percent owned by one or more socially and economically disadvantaged individuals; and (2) management and daily business operations are controlled by one or more of such individuals.[262]

Participants in the 8(a) program must satisfy both the social and economic disadvantage requirements. For purposes of the 8(a) program, the following definitions apply:

- "Socially disadvantaged individuals" are "those who have been subjected to racial or ethnic prejudice or cultural bias within American society because of their identities as members of groups without regard to their individual qualities."[263]

[260] 48 C.F.R. Parts 1-53.

[261] 15 U.S.C. § 637(a).

[262] 15 U.S.C. § 637(a)(4).

[263] 13 C.F.R. § 124.103(a).

They presumptively include African Americans, Hispanic Americans, Native Americans, Asian Pacific Americans, and Subcontinent Asian Americans.[264]

- "Economically disadvantaged individuals" are "socially disadvantaged individuals whose ability to compete in the free enterprise system has been impaired due to diminished capital and credit opportunities as compared to [non-socially disadvantaged individuals] in the same or similar line of business . . . and such diminished opportunities have precluded or are likely to preclude such individuals from successfully competing in the open market." In determining whether an individual is "economically disadvantaged," SBA specifically considers: (i) the personal financial condition of the individual claiming disadvantaged status; (ii) the financial condition of the business concern itself; and (iii) the individual's ability to obtain access to credit and capital needed to operate a competitive business enterprise.[265]

Under the 8(a) program, SBA assists disadvantaged small businesses in the making and performance of contracts by helping procuring agencies identify potential 8(a) contracts, matching the needs of 8(a) firms with available contracts, and promoting continuity of awards. SBA also establishes the fair market value price the procuring agency would pay for the contracted goods and services. Under the 8(a) program, awards may be made on either a sole source or competitive basis.

B. The Small Disadvantaged Business Participation Program

FAR 19.12 allows agencies to use the participation of small disadvantaged business (SDB) concerns in performance of a contract as an evaluation or subevaluation factor when determining the awardee of a federal contract.[266] In developing these evaluation factors or subfactors, agencies may consider the following:[267]

- The extent to which SDB entities are specifically identified;
- The extent of commitment to use SDB entities;
- The complexity and variety of work SDB entities are to perform;
- The realism of the proposal;
- Past performance of offerors in complying with subcontracting plan goals for SDB entities; and
- The extent the participation of SDB entities in terms of value of the total acquisition.

Thus, the Small Disadvantaged Business Participation Program could be used to promote environmental justice in new EPA procurements by evaluating the deployment of proposed SDB

[264] 13 C.F.R. § 124.103(b).

[265] 13 C.F.R. § 124.104.

[266] *See* FAR 19.1202-1. Because of the multiple uses of the word "concern" in this document, hereafter, we use the phrase "SDB entity" to mean "small disadvantaged business concern."

[267] *See* FAR 19.1202-3; EPAAR 1519.204(c) and 1552.219-74.

entities by each offeror submitting a proposal and theoretically awarding contracts to those entities making the most use of SDB entities.

The policies for assisting small and disadvantaged businesses in government procurements are similar to the tenets underlying environmental justice. Many of the groups defined as "socially and economically disadvantaged" for procurement purposes are those that have been subject to the types of disproportionate environmental burdens that environmental justice is designed to address. In order to promote environmental justice, EPA could more aggressively award contracts under the small and disadvantaged business programs.

C. Policies Favoring Small Business Entities Located in Historically Underutilized Business Zones (HUBZones)

The Historically Underutilized Business Zone (HUBZone) Act of 1997 created the HUBZone program whereby the federal government provides contracting help for qualified small business entities located in historically underutilized business zones "to increase employment opportunities, investment, and economic development in those areas."[268] Under the HUBZone program, there can be a HUBZone set-aside for acquisitions exceeding $100,000 if the contracting officer has a reasonable expectation that offers will be received from two or more HUBZone small business entities and the award will be made at a fair market price. Under these circumstances, procurements over $3,000 but less than $100,000 can be set aside for HUBZone concerns at the contracting officer's sole discretion.[269] Further, a contracting officer may make a sole-source award to a HUBZone entity without considering small business set-asides only if one HUBZone small business entity can satisfy the applicable requirements and if certain dollar thresholds are exceeded.[270]

These policies favoring HUBZone concerns can promote economic empowerment within "urban or rural areas with high proportions of unemployed or low-income individuals."[271]

D. Indian Incentive Program

In addition to the above, FAR 26.100 implements 25 U.S.C. § 1544, which provides an incentive to prime contractors that use Indian organizations and Indian-owned economic enterprises as subcontractors. In short, the Indian Incentive Program allows an incentive payment equal to five percent (5%) of the amount paid to a subcontractor in performing the contract, if the contract so authorizes and the subcontractor is an Indian organization or Indian-owned economic enterprise.[272]

[268] *See* 15 U.S.C. § 631 and FAR Subpart 19.13.

[269] *See* FAR 19.1305.

[270] *See* FAR 19.1306.

[271] *See* 15 U.S.C. § 631(d).

[272] *See* FAR 26.102.

III. OTHER POTENTIAL PROCUREMENT TOOLS TO ADVANCE ENVIRONMENTAL JUSTICE

A. Environmental Justice as Part of Statements of Work and Evaluation Criteria

The Agency could immediately specify environmental justice tasks in its procurement statements of work so long as those tasks state the Agency's minimum needs and further the Agency's mission.[273] Environmental justice considerations could be incorporated into evaluation criteria as long as the criteria represent the key areas of importance and emphasis to be considered in the source selection decision.[274] For example, under the appropriate circumstances, the quality of an offeror's past performance on environmental justice work could be considered by the Agency as a factor in the award selection process.

B. Require Successful Bidders to Incorporate Environmental Justice (By Sub-Contractor or Employment) in Performing the Contract Work

EPA could potentially require its contractors to promote environmental justice in performing EPA contracts through subcontracting to or direct employment of individuals/groups targeted based on environmental justice considerations. Such a requirement would have to be promulgated as an EPA Acquisition Regulation and go through notice and comment rulemaking in accordance with the Office of Federal Procurement Policy Act[275] before it could be utilized by the Agency.

[273] *See* 41 U.S.C. § 253.

[274] FAR 15.304(b).

[275] 41 U.S.C. § 418b.

CHAPTER EIGHT: FREEDOM OF INFORMATION ACT

INTRODUCTION

Access to public information about human health and the environment is a key element of advancing environmental justice under Executive Order 12898 and its accompanying Presidential memorandum. Section 5-5(c) of Executive Order 12898 provides for federal agencies to "work to ensure that public documents, notices, and hearings relating to human health or the environment are concise, understandable, and readily accessible to the public." In addition, the Presidential memorandum specifically directs agencies to "ensure that the public, including minority communities and low-income communities, has adequate access to public information relating to human health or environmental planning, regulations, and enforcement when required under the Freedom of Information Act . . . ."[276]

This chapter discusses well-established legal authorities under the Freedom of Information Act (FOIA).[277] The process identified below has the potential for a high level of impact in advancing environmental justice. In summary, special modifications to advance environmental justice could be incorporated into EPA's upcoming anticipated FOIA rulemaking, followed by introducing new policies and practices implementing FOIA that would achieve maximum results with minimal changes. Thus, a combination of regulatory change, complementary new internal policy and procedures, increased outreach and training for overburdened communities and interested groups, and improved attention to accessibility of information for overburdened communities, can all be used to augment EPA's commitment to environmental justice.

FOIA

I. BACKGROUND REGARDING FOIA PROCESSES

FOIA provides the public with access to information regarding the activities of federal executive agencies. It also contains important exemptions that protect certain classes or types of information. A FOIA request is generally a request to a federal agency for access to records concerning another person (as opposed to the requester), an organization within the agency, or a particular topic of interest. In 2009, the Obama Administration issued two memoranda to the heads of agencies, committing to a new level of openness in government and stressing the importance of FOIA in that pursuit.

Over the past decade, the Agency has moved in the direction of more FOIA accountability and reduction of its FOIA backlog. More recently, proactive disclosure of information as a means of eliminating the need for the public to file a FOIA request provides broader access to environmental information. Proactive disclosure of information facilitates several strategy objectives to promote environmental justice. These include, at a minimum,

[276] 30 Weekly Comp. Pres. Doc. at 280.

[277] 5 U.S.C. § 552.

increased public participation in numerous aspects of EPA's work, improved knowledge base on environmental justice issues, increased information and data collection relating to the health and environment of overburdened communities, and related goals.

II. FOIA PROCESSES—REGULATORY CHANGES AND NEW POLICY/PROCEDURES

EPA's FOIA regulations[278] were last updated in 2002. In 2007, for the first time in over a decade, Congress amended FOIA by passing the OPEN Government Act of 2007. The new law addresses how FOIA is administered and codifies provisions of Executive Order 13392, entitled "Improving Agency Disclosure of Information."[279] EPA's FOIA regulations have not yet been revised to implement the 2007 Act, but EPA expects to do so, informed by guidance from the U.S. Department of Justice.

In the course of revising its FOIA regulations, EPA could consider using the opportunity to advance environmental justice by enhancing access to information by minority, low-income, and indigenous populations. EPA's statutory and regulatory authorities provide a broad, discretionary basis for protecting human health and the environment. Enhancing access to information would recognize the heightened public health concerns often present in overburdened communities.

Improving the effectiveness of FOIA for overburdened communities could likely be done in a number of ways.

First, and not insignificantly, the following approaches are dependent on defining and identifying a given FOIA request as one raising an environmental justice issue. Various authorities emphasize the unique nature of overburdened communities, but as FOIA requests now exist, there is no unique identifier that would identify a given request as sensitive to environmental justice issues. Thus, EPA could develop metrics to clearly and easily identify those requests in the Agency's initial review.

Second, EPA could use discretionary disclosure authority under FOIA to help address the information needs of minority, low-income, and indigenous populations. In March 2009, the U.S. Attorney General encouraged the use of discretionary FOIA disclosures by instituting a series of new principles: (1) an agency should not withhold information simply because it may do so legally; (2) if full disclosure is not possible, an agency should consider partial disclosure; (3) an agency should proactively and promptly handle FOIA requests; and (4) an agency should as a matter of course post information online using modern technology – even in advance of any public request. These principles lend themselves easily to advancing environmental justice and may facilitate the type of information access overburdened communities may need from EPA.

As a general rule, EPA's ability to make a discretionary disclosure depends on whether a discretionary exemption applies. EPA cannot make a discretionary disclosure for non-discretionary exemptions, including Exemption 1 (national security), Exemption 3 (disclosure prohibited by another statute), Exemption 4 (confidential business information), and Exemptions

[278] 40 C.F.R. Part 2.

[279] 70 Fed. Reg. 75373 (Dec. 19, 2005).

6 and 7(C) (both related to personal privacy). Where EPA has information that is covered only by an exemption that allows discretionary disclosure, that information may be released in response to a FOIA request.

Third, a searchable repository of records released under FOIA could be made available on a public website. Such a repository could include an environmental justice "tag" for records and projects that may be of interest to minority, low-income, or indigenous populations. A searchable, public database would aid proactive disclosure of environmental justice data, research, issues, education, and Agency actions. As EPA moves towards proactively identifying and posting FOIA information, it could consider integrating these "tags" into this process. And database design should emphasize accessibility in format, comprehension, ease of use, and cost effectiveness in use.

Fourth, the information needs of overburdened communities may be considered in the way the information is provided or presented. For example, where electronic access may be limited, and the number of responsive records makes it practical to do so, the information can be provided in hard copy. Additionally, where information is of a highly technical nature, explanatory or background information may be included with the response. These opportunities are highlighted further under Section IV below.

III. FOIA ENVIRONMENTAL JUSTICE TRAINING

Training could be provided to EPA offices in order to enhance responsiveness to environmental justice considerations through the FOIA process, consistent with the reforms discussed above. Training could, among other things, alert staff to look for opportunities to make proactive, public disclosures at an earlier stage, even prior to an actual FOIA request. Informed staff may be able to identify environmental data, information, research, and activities of importance to overburdened communities, and these could be provided on EPA's website. Such proactive, pre-request public disclosures could include, for example, EPA-required information from pollution sources, unless prohibited by law.

Similarly, outreach and training efforts could be increased in interested communities. Training could enhance community awareness of FOIA as a tool to advance environmental justice.

IV. FOIA PROCESSES: INFORMATION COMPREHENSIBILITY AND ACCESSIBILITY

Information of value to overburdened communities could be created, formatted, and provided to these communities in a way that advances the goals of comprehensibility and accessibility. Although FOIA does not require the creation of new records, the Agency could choose to put information that is highly technical, scientific, medical, or complex in nature into plain language synopses in order to serve a wide range of educational backgrounds. Second, the Agency may choose to translate documents in circumstances involving limited English proficiency. Financial challenges of low-income populations could be taken into account as well – with an eye toward reducing the costs associated with making FOIA requests by perhaps shifting to pre-request electronic disclosures on EPA's website. Limited income may also be associated with reduced access to the Internet, and this may prevent some communities from

seeking public information. Cooperation, training, and outreach to interested groups and public information entities such as libraries may also help address these concerns.

CONCLUSION

The FOIA process provides a vehicle that could advance environmental justice. Much of what could be accomplished in this area is accessible under current law. Where regulatory change is indicated, it could be accomplished in the course of upcoming, anticipated changes to EPA's FOIA regulations.

Subject: Fw: 1x10e-6 as a Definition of Acceptable Risk

Hi,

The last time I came across Kate Kelly's diatribe discounting development of 1 in a million as a regulatory risk value was when I was working on development of the WA State Dept. of Ecology's version of CERCLA. Washington is now revising its ambient water quality criteria and I've been trying to assist them. Ecology is now facing pressure from the pulp and paper industry on the use of 1 in a million as the lower end of Ecology's risk range for its AWQC.

I was wondering whether any of you had seen any cogent arguments as to why 1 in a million is an appropriate value for the lower end of EPA's risk range? Alternatively, I was wondering if there were others I should circulate this to.

Thanks!

Hi Lon. Here is the paper. Would like to know if the information about the FDA is correct as to the origin of 10-6. Thanks for your help! Cheryl

Water Quality Standards – Delegates' Table Attendance List

June 24, 2013, 9:30 AM–2:10 PM; Lacey Community Center

Delegates:

- **Hellman, Johan** *(Washington Public Ports Association)*
- **Hope, Bruce** *(Western States Petroleum Association)*
- **Housekeeper, Brandon** *(Association of Washington Business)*
- **Humphreys, Brandy** *(Confederated Tribes of Grand Ronde)*
- **Johnson, Ken** *(Weyerhaeuser)*
- **Judd, Nancy** *(Association of Washington Business)*
- **Kibbey, Heather** *(City of Everett)*
- **Kilroy, Sandra** *(King County)*
- **Myrum, Tom** *(Washington State Water Resources Association)*
- **Rawls, Bruce** *(Spokane County)*
- **Schroeder, Carl** *(Association of Washington Cities)*
- **Steele, David** *(Pacific Coast Shellfish Growers)*
- **Stuhlmiller, John** *(Washington Farm Bureau)*

Audience:

- **Alam, Mahbub** *(Department of Ecology)*
- **Aldrich, Nancy** *(City of Richland)*
- **Bartlett, Karen** *(City of Tacoma)*
- **Barton, Dianne** *(Columbia River Inter-Tribal Fish Commission)*
- **Blair, Lori** *(Boeing Company)*
- **Book, Seth** *(Skokomish Tribe)*
- **Brazil, Brian** *(Trans Alta)*
- **Brouillard, Elaine** *(Roza Sunnyside Board of Joint Control)*
- **Budworth, Chad** *(Boeing Company)*
- **Chung, Angela** *(Environmental Protection Agency - Region 10)*
- **Crane, Stuart** *(Yakama Nation)*
- **Creech, Jane** *(Department of Ecology)*
- **Curry, James** *(Northwest Food Processors Association)*
- **Deutsch, Joanie** *(Strategies360)*
- **Dick, Frank** *(City of Vancouver)*
- **Fuller, Elayne** *(East Columbia Basin Irrigation District)*
- **Gatchalian, Don** *(Yakima County)*
- **Hoff, Gina** *(United States Bureau of Reclamation)*
- **Holm, Kris** *(Water Resources Northwest)*
- **Howard, Sandy** *(Department of Ecology)*
- **Loehr, Lincoln** *(Stoel Rives)*
- **Merkle, Carl** *(Confederated Umatilla Tribes)*
- **Morrow, Jon** *(City of Ellensburg)*
- **Oleson, Mel** *(Boeing Company)*
- **Patora, Kasia** *(Department of Ecology)*
- **Peeler, Dave** *(Self)*
- **Peterson, John** *(Clark Regional Wastewater District)*
- **Rice, Casey** *(Yakima Valley Community College)*
- **Rozmyn, Lisa** *(Washington State University)*
- **Schmidt, Lynn** *(City of Spokane)*
- **Scott, Kevin** *(Port Townsend Paper)*
- **Shopbell, Stephanie** *(South Columbia Basin Irrigation District)*
- **Szelag, Matthew** *(Environmental Protection Agency - Region 10)*
- **Turner, Doris** *(Boeing Company)*
- **Wagner, Theresa** *(City of Seattle)*
- **Wendling, Peg** *(City of Bellingham)*
- **Zhang, Sarah** *(Self)*

Water Quality Standards Public Meeting Attendance List

November 6, 2013; Ecology Headquarters Building

The following individuals attended Ecology's November 6, 2013, Water Quality Standards public meeting:

- **Ahearn, Ashley** *(KUOW National Public Radio)*
- **Anderson, Kym** *(Port of Seattle)*
- **Asher, Chance** *(WA Department of Ecology)*
- **Barton, Dianne** *(Columbia River Inter-Tribal Fish Commission)*
- **Bethel, Heidi** *(U.S. EPA)*
- **Blair, Lori** *(The Boeing Company)*
- **Bolster, Todd** *(Northwest Indian Fisheries Commission)*
- **Bowden, Brent** *(City of Seattle)*
- **Brazil, Brian** *(TransAlta)*
- **Britsch, Steve** *(Snohomish County)*
- **Brouillard, Elaine** *(Roza-Sunnyside Board of Joint Control, RSBOJC)*
- **Chung, Angela** *(US EPA, Region 10)*
- **Cochrane, Brian** *(Yakima County Public Services)*
- **Conner, Leslee** *(Port of Tacoma)*
- **Cooper, Betsy** *(King County)*
- **Cornfield, Jerry** *(The Herald)*
- **Cruickshank, Peter** *(Yakama Nation)*
- **Daly, Brad** *(City of Walla Walla)*
- **Dean, Alison** *(Simpson Tacoma Kraft Co)*
- **Degens, Roxanne** *(EA Engineering, Science, and Technology, Inc.)*
- **Dewey, Bill** *(Taylor Shellfish Farms)*
- **Dickison, Jeff** *(Squaxin Island Tribe)*
- **Duncan, David** *(WA Department of Ecology)*
- **Dunn, Larry** *(Lower Elwha Klallam Tribe)*
- **Dykstra, Peter** *(Plauché & Carr LLP)*
- **Erwin, Tanyalee** *(Washington Stormwater Center at WSU)*
- **Feist, Marlene** *(City of Spokane)*
- **Garber, Andrew** *(Seattle Times)*
- **Gatchalian, Don** *(Yakima County)*
- **Graham, Bryan** *(Schnitzer Steel)*
- **Greenlund, Doug** *(City of Spokane Environmental Programs)*
- **Guthrie, Marilyn** *(Port of Seattle)*
- **Hastings, Tina** *(CH2M HILL)*
- **Hayman, Glenn** *(Hayman Environmental)*

- **Hildebrandt, Peter** *(Alcoa and WSPA)*
- **Holm, Kris** *(Water Resources NW)*
- **Holmes, Frank** *(Western States Petroleum Association)*
- **Houskeeper, Brandon** *(Association of Washington Business)*
- **Humphreys, Brandy** *(Confederated Tribes of Grand Ronde)*
- **Hupp, Marcy** *(Perkins Coie)*
- **Johnson, Ken** *(Weyerhaeuser)*
- **Judd, Nancy** *(Windward for AWB)*
- **Kaetzel, Rhonda** *(Public Health Seattle-King County)*
- **Kibbey, Heather** *(City of Everett)*
- **Kilroy, Sandra** *(King County)*
- **Kissinger, Lon** *(US EPA, Region 10)*
- **Knowles, Alfred** *(URS Corporation)*
- **Knutson, Allison** *(HDR Engineering, Inc.)*
- **Kramer, Becky** *(The Spokesman-Review)*
- **Krapas, Doug** *(Inland Empire Paper Company)*
- **Kukes, Dee** *(Quincy-Columbia Basin Irrigation District)*
- **Loehr, Lincoln** *(Stoel Rives)*
- **Logan, Lee** *(Inside EPA)*
- **Louch, Jeff** *(National Council for Air and Stream Improvement)*
- **Macchio, Lisa** *(US EPA, Region 10)*
- **Matzke, Andrea** *(Oregon Dept. of Environmental Quality)*
- **McBride, Dave** *(WA Dept. of Health)*
- **McCabe, Chris** *(Northwest Pulp & Paper Association)*
- **McCollum, Paul** *(Port Gamble S'Klallam Tribe)*
- **McCrea, Rachel** *(WA Department of Ecology)*
- **McGinnis, Roger** *(Hart Crowser)*
- **McKague, Jeanette** *(Washington REALTORS)*
- **McKay, Amanda** *(Floyd|Snider)*
- **Merrill, Laura** *(WA State Association of Counties)*
- **Moore, Rick** *(CH2M HILL)*
- **Myers, Scott** *(Self)*
- **Myrum, Tom** *(Washington State Water Resources Association)*
- **Naylor, Char** *(Puyallup Tribe)*
- **Nelson, Mary** *Anne (Idaho DEQ)*
- **Nelson, Libby** *(Tulalip Tribes)*
- **Norcross, Neil** *(Tesoro)*
- **O'Connell, Emmett** *(Northwest Indian Fisheries Commission)*
- **Ogier, Sarah** *(King County)*
- **O'Keefe, Gerry** *(Washington Public Ports Association)*
- **O'Neill, Catherine** *(Seattle University)*
- **O'Rourke, Rory** *(Port Gamble S'Klallam Tribe)*
- **Parkinson, Dave** *(Geosyntec Consultants)*
- **Peeler, Dave** *(Deschutes Estuary Restoration Team)*
- **Peterson, John** *(Clark Regional Wastewater District)*
- **Pfeifer, Grant** *(WA Department of Ecology)*

Water Quality Standards Update: Next Steps Attendance List

July 22, 2014, 1:30 - 3:30 PM; Ecology Headquarters Building

- **Alam, Mahbub** *(WA Dept. of Ecology)*
- **Aldrich, Nancy** *(City of Richland)*
- **Archer Parsons, Andrea** *(City of Port Orchard)*
- **Baca, Matthew** *(Earthjustice)*
- **Bain, David** *(Cascadia Environmental Science Center)*
- **Balliet, Jamie** *(East Columbia Basin Irrigation District)*
- **Barnes, Abby** *(WA Department of Natural Resources)*
- **Barrette, Margaret** *(Pacific Coast Shellfish Growers Association)*
- **Barton, Dianne** *(Columbia River Inter-Tribal Fish Commission)*
- **Bauman, Jenise** *(Western Washington University)*
- **Benbrook, Rachel** *(Nooksack Salmon Enhancement Association)*
- **Bierlink, Henry** *(Whatcom Farm Friends)*
- **Blair, Lori** *(The Boeing Company)*
- **Boehme, Jonathan** *(City of Port Angeles)*
- **Bolster, Todd** *(Northwest Indian Fisheries Commission)*
- **Book, Seth** *(Skokomish Tribe)*
- **Booth, Kevin** *(Avista Corp)*
- **Borden, Bruce** *(Lowes)*
- **Bravinder, Phyllis** *(Fidalgo Bay Aquatic Reserve Citizen Science Committee)*
- **Brazil, Brian** *(TansAlta)*
- **Bremer, David** *(Representative Denny Heck)*
- **Bridges, Thomas** *(Mukilteo Water & Wastewater Disrict)*
- **Brimmer, Janette** *(Waterkeepers Washington / Pacific Coast Federation of Fishermen's Associations)*
- **Brouillard, Elaine** *(Roza Sunnyside Board of Joint Control)*
- **Brown, Chad** *(WA Dept. of Ecology)*
- **Bryant, Mark** *(Hart Crowser)*
- **Buchalski, Catherine** *(WSU Skagit County Extension)*
- **Budworth, Chad** *(The Boeing Company)*
- **Burdick, Sarah** *(WSDOT)*
- **Burgess, Karen** *(United States Environmental Protection Agency)*
- **Buterbaugh, Galen** *(Lake Spokane Association)*
- **Butkus, Paul** *(PCA /Boise Paper)*
- **Cabbage, Patrick** *(WA Dept. of Ecology)*
- **Castle, Art** *(Building Industry Association of Washington)*
- **Cave, Scott** *(City of Quincy)*
- **Chase, Scott** *(WSU Shore Stewards, Island County)*
- **Chen, Wendy** *(EA Engineering, Science and Technology, Inc)*

- **Chisolm, B** *(WAPG)*
- **Chung, Angela** *(United States Environmental Protection Agency, Region 10)*
- **Collins, Kathleen** *(Washington Water Policy Alliance)*
- **Converse, Brett** *(JUB Engineers)*
- **Cornfield, Jerry** *(The Herald)*
- **Cotelesse, Chris** *(InsideEPA)*
- **Creech, Jane** *(WA Dept. of Ecology)*
- **Crompton, Becky** *(Golder Associates)*
- **Crowley, Allison** *(Seattle City Light)*
- **Cummings, Dano** *(City of Spokane)*
- **Daly, Brad** *(City of Walla Walla)*
- **Davis, Marcia** *(City of Spokane)*
- **Dayao, Donnelle** *(City of Sumner)*
- **Deardorff, Gary** *(City of Kennewick)*
- **Defoe, Seth** *(Kennewick Irrigation District)*
- **Deutsch, Joanie** *(Strategies 360)*
- **DeVaney, Jon** *(Yakima Valley Growers-Shippers Association)*
- **Durance, Kristen** *(Ross Strategic)*
- **Ehlebracht, Mike** *(Hart Crowser)*

To: Chung, Angela; Matthew Szelag
Subject: Meetings to discuss EPA input on ECY rules

Angela and Matt—Below are a list of items that I suggest we walk through in a series of 3 meetings. Maybe schedule 4 in case we need more. I am thinking I would get Kelly to attend the last one so we could do a summary of where we are with regard to your feedback and how we will message our options that we will present on November 6th.

The following dates look open and we could devote up to 3 hours (or more) toward a meeting. I think the HHC should be ready to happen sooner. We are developing options/outline for variance rule now and I would like to have that in a more final form for when we meet with you.

October 8, 16, 21, 22, 25,30 and Nov 1

Thanks-Melissa

Items to discuss with EPA prior to Nov 6th

Meeting #1 - Human Health Criteria—
Walk through the specific options and get EPA feedback.
Relative Source Contribution Discussion
Risk Level Discussion
Salmon in and Salmon Out discussion
Consumer vs. nonconsumer
Discussion around messages for work being done in Idaho.

Meeting #2 - Implementation Tools
Compliance Schedule (20 year)
Intake Credit
Variances
-Statewide variance
-Waterbody wide variance
-Discharger specific variance
-Use of other pollution control programs to support variance
-Variance program similar to Idaho

Meeting #3 - Role up of HHC & implementation discussions and the options that will be presented on Nov 6th. Clarify Messages for each agency especially where there is potential push on guidance. Possibly just have Kelly and Dan at this meeting once we have completed legwork with the other two meeting.

Melissa Gildersleeve, Section Manager, Water Quality, Department of Ecology 360-407-6461

Subject: Re: Listing and EJ Discussion

Thanks for the follow-up. I have my folks following up on the listing methodology question and will get back to you on that.

Regarding the environmental justice concern, you are right that there isn't anything that will/does call out a particular risk level. Dennis' central point is that in the context of the other rules and programs in place in the state and their fairly consistent protection at 10-6, the potential disproportionality enters in when you're looking now at a rule whose protection relates so fundamentally to consumption behavior, with many (though not all) of the high consumers being tribal people and other ethnic groups with subsistence or near subsistence fish consumption levels. So it is not about disparate treatment within the rule or relative to a specific standard, but about going with a potentially different risk target for a particular rule that is especially relevant to the lifestyles and traditional practices of specific subpopulations.

I'm heading out early in the morning for a long day of travel to southern Idaho and back. I'll try to be responsive when I can and then will be back in on Thursday.

DanO.

Dennis McLerran, Regional Administrator
U.S. EPA Region 10
1200 Sixth Avenue, Suite 900
Seattle, WA 98101

Dear Mr. McLerran,

As you know, Washington's Department of Ecology is revising the human health criteria for the state's surface water quality standards. The new water quality standards will be the basis for a wide range of regulatory decisions that affect all Washington residents. Therefore, I am seeking to assure that the criteria, which will be reviewed by EPA, is supported by sound scientific analysis and that it will not harm the state's economic vitality.

One particular concern is cancer risk. Your review of the state's proposed criteria will include consideration of the appropriate cancer risk for Washington. I understand that your agency's policies establish a generally acceptable cancer risk range, typically falling between 10-6 and 10-4 risk level. EPA guidance also provides that the agency will afford flexibility for states to adopt cancer risk levels that best suit the state's goals for use of its surface waters.

Unfortunately, a recent conversation with officials and stakeholders has revealed some uncertainty surrounding EPA's review of cancer risk. I respectfully seek a response from your agency that outlines the review process that the state's proposed criteria will undergo, and I specifically would like to know what your agency considers to be an appropriate cancer risk level for Washington.

Recycled

I also seek your input as to the state's options for setting a cancer risk level -- i.e. whether the criteria may be based on a risk level chosen from a generally acceptable range, whether EPA expects Washington to adopt a risk level of 10-6, or whether other options are available.

Thank you for your attention to this matter.

Sincerely,

Senator Doug Ericksen, Chair
Senate Energy, Environment
and Telecommunications Committee

APR 2 4 2014

The Honorable Doug Ericksen
Energy, Environment and Telecommunications Committee Chair
Washington State Senate
Post Office Box 40442
Olympia, Washington 98504-0442

Dear Senator Ericksen:

Thank you for your letter dated April 3, 2014. I appreciate your taking the time to express your concerns regarding the Department of Ecology's (Ecology's) ongoing process to adopt human health criteria into Washington's water quality standards. As you know, the Environmental Protection Agency supports Ecology's efforts to use scientifically sound regional and local fish consumption data as part of its rulemaking. Your letter specifically asks about the EPA's process for reviewing the State's human health criteria and the EPA's perspective on the cancer risk level that Ecology may use to derive human health criteria for carcinogens.

The EPA intends to comprehensively review Ecology's human health criteria, including how Ecology integrates science in its policy decisions to provide health protection for all citizens of Washington, including high fish consumers. In its review, the EPA must ensure that the human health criteria Washington State adopts are protective of applicable designated uses and based on a sound scientific rationale, consistent with 40 CFR § 131.11(a).

Currently, Washington's water quality standards contain a provision that states, "[r]isk-based criteria for carcinogenic substances shall be selected such that the upper-bound excess cancer risk is less than or equal to one in one million." WAC 173-201A-240(6). If Ecology were to revise this language to allow for a different risk level, the EPA would expect Ecology to provide a rationale that explains how such a policy change would be protective given Ecology's current policy position and available data that indicate a broad spectrum of Washington citizens regularly eat fish. The EPA recommends that Ecology carefully consider the implications of making a potential change to its existing cancer risk level and how it would affect the health protection of all fish consumers in the State, including high fish consumers.

Again, thank you for contacting the EPA. If you have any questions, please feel free to contact me or have your staff contact Dan Opalski, the Director of the Office of Water and Watersheds. You can reach Dan by phone at (206) 553-1855 or by email at opalski.dan@epa.gov.

Sincerely,

Dennis J. McLerran
Regional Administrator

Office of the Regional Administrator

Dennis McLerran, Regional Administrator
U.S. EPA Region 10
1200 Sixth Avenue, Suite 900
Seattle, WA 98101

Dear Regional Administrator McLerran,

Thank you for responding to my April 3 letter regarding the ongoing process to adopt human health criteria into Washington's water quality standards. Unfortunately, your response highlights one of the great shortcomings of current government. I asked a specific question relating to a very important issue that will affect Washington's economy and public health, but you did not provide me with a specific answer. Here is an excerpt from my letter:

I respectfully seek a response from your agency that outlines the review process that the state's proposed criteria will undergo, and I specifically would like to know what your agency considers to be an appropriate cancer risk level for Washington. I also seek your input as to the state's options for setting a cancer risk level—i.e. whether the criteria may be based on a risk level chosen from a generally acceptable range, whether EPA expects Washington to adopt a risk level of 10-6, or whether other options are available.

I am taking this opportunity to rephrase my inquiry for the sake of clarity. Please answer the following questions:

(1) Have you or your staff indicated to the Washington Department of Ecology (Ecology) that there is a threshold cancer risk level that must be proposed for the state's criteria to receive approval?

(2) Have you or your staff indicated to Ecology that a cancer risk level of 10-6 is required or that it is the level you want the state to propose?

(3) Have you or your staff provided any specific directives to Ecology outlining what you will accept for a cancer risk level for Washington?

Thank you for your attention to this matter. I look forward to your prompt response.

Sincerely,

Senator Doug Ericksen, Chair
Senate Energy, Environment
and Telecommunications Committee

JUL 1 2014

The Honorable Doug Ericksen
Energy, Environment, and Telecommunications Committee Chair
Washington State Senate
Post Office Box 40442
Olympia, Washington 98504-0442

Dear Senator Ericksen:

Thank you for your letter dated May 28, 2014. I appreciate your taking the time to follow up with me about the Department of Ecology's ongoing rulemaking process to adopt human health criteria into Washington's water quality standards. The U.S. Environmental Protection Agency is very appreciative of the challenging work that Ecology has undertaken thus far to adopt human health water quality criteria, which has included a robust public process and a detailed review of the factors used to derive human health criteria, including scientifically sound regional and local fish consumption data. Your letter asks three related questions about the EPA's communications regarding the cancer risk level that Ecology may use to derive human health criteria for carcinogens. Below is my response to your questions.

As you may be aware, water quality criteria must protect applicable designated uses and be based on sound scientific rationale (see 40 CFR § 131.11(a)). In discussions with Ecology and other interested parties, the EPA has acknowledged the language in its national guidance for deriving ambient water quality criteria to protect human health (EPA's 2000 Human Health Methodology) regarding state adoption of water quality criteria for carcinogens. The Methodology identifies some flexibility in choosing cancer risk levels below Washington's current ten to the minus six (10^{-6}) level of protection. At the same time, the EPA recognizes that the Methodology encourages the consideration of local and regional data when available and that other important principles, such as environmental justice and treaty rights, need to be considered in decisions by the states and the EPA on water quality standards, including risk levels.

When reviewing the State's adopted human health water quality criteria, the EPA will consider Ecology's basis for justifying the input parameters used to calculate the criteria, ensuring that they are consistent with the best available science and a sound scientific rationale. In addition, the EPA has communicated to Ecology that we will need to review the State's entire final water quality standards submittal to better understand Ecology's overall plan to reduce toxic pollutants in the environment before determining what Clean Water Act action we will take. These types of details are important elements implicit in my April 24, 2014 response to you, where I indicated that the EPA must ensure that the human health criteria that Washington adopts are protective of applicable designated uses and based on a sound scientific rationale.

Regarding the specific issue of water quality criteria to limit exposure to cancer-causing pollutants, I have recommended that Ecology retain their current state-wide cancer risk level of 10^{-6}, which is used to

derive the State's human health criteria. There are several reasons why I would like Ecology to maintain their cancer risk level of 10^{-6}.

First, Washington's risk-based criteria for carcinogenic substances were derived by the EPA under the National Toxics Rule using a cancer risk level of 10^{-6}, pursuant to Washington's decision to select that risk level. In the current human health criteria rulemaking process, Ecology has stated a desire to better protect higher fish consumers in Washington. It is not clear why, in developing human health criteria to protect higher fish consumers, it is necessary or appropriate for Washington to reduce the level of cancer risk protection for the entire State – a level that has been in effect for more than twenty years.

Second, if Washington reduces the level of cancer risk protection from the current level of 10^{-6}, tribes, certain low-income, minority communities, and other high fish consuming groups could be provided less protection than they have now. Thus, a reduction in the level of cancer risk protection raises environmental justice concerns, which are a significant consideration in the EPA's review of the State's overall submittal. Consistent with Executive Order 12898 and the EPA's environmental justice policy and guidance documents, such as the EJ Legal Tools document issued in December 2011, the EPA incorporates environmental justice considerations into its decision-making. Notably with respect to many of the tribes, this approach to the cancer risk level would not advance environmental or public health protections consistent with their treaty-reserved right to harvest and eat fish and shellfish.

Third, in order to protect downstream waters consistent with the EPA's regulations at 40 CFR 131.10(b), I support regional consistency among Region 10 states and authorized tribes particularly when there are similarities in pollutants and associated environmental and human health risks. In line with that, I believe this is an opportunity for Washington to join Oregon as a national environmental leader in setting human health criteria that protect the designated uses and reflect the best available regional and local data. Seizing that opportunity will involve thoughtful selection of a cancer risk level that protects not only the State's general population, but its most vulnerable populations.

I firmly believe that there is a way for Ecology to adopt a water quality standards package that retains the State's current 10^{-6} level of protection from cancer-causing pollutants while giving industry time to comply with more stringent water quality criteria through implementation tools, such as compliance schedules and variances. I think this approach could support a thriving economy while protecting higher fish consuming populations.

Again, thank you for your follow-up inquiry. If you have any questions, please feel free to contact me or have your staff contact Dan Opalski, the Director of the Office of Water and Watersheds. You can reach Dan by phone at (206) 553-1855 or by email at opalski.dan@epa.gov.

Sincerely,

Dennis J. McLerran

Protection of Downstream Waters in Water Quality Standards: Frequently Asked Questions

DISCLAIMER

These Frequently Asked Questions (FAQs) do not impose legally binding requirements on the U.S. Environmental Protection Agency (EPA), states, tribes, or the regulated community, nor do they confer legal rights or impose legal obligations upon any member of the public. The Clean Water Act (CWA) provisions and the EPA regulations described in this document contain legally binding requirements. These FAQs do not constitute a regulation, nor do they change or substitute for any CWA provision or the EPA regulations.

The general description provided here may not apply to a particular situation based upon the circumstances. Interested parties are free to raise questions about the substance of these FAQs and the appropriateness of their application to a particular situation. The EPA retains the discretion to adopt approaches on a case-by-case basis that differ from those described in these FAQs where appropriate. These FAQs are a living document and may be revised periodically without public notice. The EPA welcomes public input on these FAQs at any time.

1. Why is it important that upstream designated uses and water quality criteria ensure the attainment and maintenance of downstream water quality standards?

Pursuant to sections 303 and 101(a) of the Clean Water Act ("CWA" or "the Act"), the federal regulation at 40 CFR 131.10(b) requires that "*In designating uses of a water body and the appropriate criteria for those uses, the State shall take into consideration the water quality standards of downstream waters and shall ensure that its water quality standards provide for the attainment and maintenance of the water quality standards of downstream waters.*" This provision requires states and authorized tribes (hereinafter "states/tribes") to consider and ensure the attainment and maintenance of downstream[1] water quality standards (WQS) during the establishment of designated uses and water quality criteria in upstream[2] waters. Adopting either narrative or numeric criteria to ensure the attainment and maintenance of downstream WQS (i.e., designated uses, criteria and antidegradation requirements) may likely be the preferred path for states/tribes to ensure consistency with 40 CFR 131.10(b). This is especially important if there

[1] The EPA interprets the term "downstream" to include both intra- and interstate waters, as well as waters that form a boundary between adjacent jurisdictions.

[2] Throughout these FAQs the EPA is using the term "upstream" to include "instream" when referring to the water body(ies) for which states/tribes are developing designated uses/water quality criteria that will ensure the attainment and maintenance of downstream WQS.

are data or information suggesting that upstream designated uses and/or water quality criteria may not provide for the attainment and maintenance of downstream standards.

Designated uses and water quality criteria that ensure attainment and maintenance of downstream WQS may be important because they may help to avoid situations where downstream segments become impaired due, either in part or exclusively, to individual or multiple pollution sources located in upstream segments. Designated uses and water quality criteria that provide for the attainment and maintenance of downstream WQS may help support more equitable use of any assimilative capacity available to upstream and downstream pollution sources and/or jurisdictions and may facilitate restoration of the downstream waters. Ensuring the attainment and maintenance of downstream WQS during development of upstream designated uses and water quality criteria may also help limit and/or avoid resource-intensive water quality problems and/or legal challenges that can occur after adoption of uses and criteria that lack consideration of downstream waters' WQS. Furthermore, downstream protection consideration prevents the shifting of responsibility for pollution reductions from upstream sources and/or jurisdictions to downstream sources and/or jurisdictions. State/tribal uses and criteria that protect downstream waters may, among other things, increase the resiliency of the nation's waters to climate change and may help address environmental justice issues in urban waters. In addition, designated uses and criteria that ensure attainment and maintenance of downstream WQS facilitate consistent and efficient implementation and coordination of water quality-related management actions (e.g., water quality monitoring and assessment, development of Total Maximum Daily Loads (TMDLs) and other watershed-based restoration and protection plans, and National Pollutant Discharge Elimination System (NPDES) permitting and CWA Section 401 certifications).

Consistent with the disclaimer above, the EPA reiterates that these FAQs do not impose any additional requirements on states/tribes with regards to downstream protection beyond those requirements already identified in 40 CFR 131.10(b). States/tribes have discretion in choosing their preferred approach to downstream protection based on their individual circumstances, and these FAQs are not intended to limit a state's or tribe's discretion, provided their selected criteria approach is also consistent with 40 CFR 131.11. Furthermore, the EPA recognizes that states/tribes may not have the available resources to develop numeric criteria to protect downstream waters at this time or in the near future; therefore, these FAQs envision a hybrid approach where a state/tribe may adopt narrative criteria, numeric criteria or a combination of these criteria. In addition to the discussion of possible criteria development approaches discussed in response to Question 3, *"What are possible criteria development approaches for ensuring the attainment and maintenance of downstream WQS?,"* the EPA has developed a set of four customizable templates[3] for narrative downstream protection criteria to assist states/tribes with this effort. These templates may be used to develop a "broad narrative" that provides basic legal coverage under 40 CFR 131.10(b) (e.g., applies to all waters in the state/tribe) as well as a variety of "tailored narratives" that can be developed to address specific water bodies, pollutants, and/or water body types.

[3] http://water.epa.gov/scitech/swguidance/standards/narrative.cfm

2. What should states/tribes consider regarding downstream protection when developing and adopting upstream designated uses and water quality criteria?

- **Use a watershed approach to develop WQS.**
  Early in the process of developing designated uses and/or water quality criteria, it is useful to take a step back and consider water quality at the United States Geological Service (USGS)-defined subwatershed (e.g., HUC 12) or broader geographic scale. Such an analysis could be as general or detailed as a state's or tribe's resources allow. Start by asking questions about what the most sensitive designated uses are within such a watershed, which uses are in place downstream, and what criteria are in place to protect those uses. Developing a designated use inventory and/or map[4] that identifies uses within a watershed may help in defining the scope of potential downstream vulnerabilities. States/tribes may already have developed advanced mapping tools that can be used in this effort. It may also be useful to consider whether the uses and criteria for the downstream receiving waters are adequate or if they need to be developed, revised or refined. In addition, consider other water bodies that may flow to downstream waters and may affect hydrologic flow and/or pollutant concentrations in these locations. Also, if dealing with a subwatershed, consider which upstream subwatershed might have the greatest potential to positively or negatively impact downstream water quality (e.g., based on land characteristics and use, proximity to sensitive downstream waters, water body characteristics, stressor source and distribution). Furthermore, understanding and considering the programmatic (e.g., point and nonpoint source, assessment, listing and TMDL) and jurisdictional issues at play and any solutions in place at the subwatershed or overall watershed levels may provide useful information and help to avoid potential future conflicts.

- **Communicate and coordinate early between jurisdictions, programs, and agencies regarding shared watersheds.**
  When a state/tribe is developing designated uses and water quality criteria that may affect the waters of another state or jurisdiction, early communication with the potentially affected jurisdiction(s) and with the EPA (as appropriate) is key to help define the scope of downstream protection issues and determine protective endpoints. States may also consider the administrative processes and procedures for setting WQS that are outlined in their regulations. Where possible, adjacent states/tribes may find it useful to develop WQS jointly for shared waters. States/tribes may consider creating a formal agreement (e.g., Memorandum of Understanding (MOU), joint powers agreement), developing partnerships (e.g., watershed commission), and/or including third party entities (possibly the EPA) to assist with cross-jurisdictional or cross-program communication and coordination. Also, the EPA/states/tribes may consider developing an electronic communications clearinghouse that can be used to coordinate complex issues with multiple stakeholders, as well as having periodic check-ins to ensure that appropriate actions are being taken and to determine if adjustments are needed.

[4] One tool that can provide a starting point for this type of analysis is the National Atlas' Streamer, which can be used to trace downstream or upstream from any point on a stream or river: http://nationalatlas.gov/streamer/welcome.html

To foster consistency and efficiencies across programs, state/tribal WQS programs may wish to find out how other programs such as their state's NPDES, assessment/listing, and TMDL programs may consider and protect downstream waters, and what information or direction those other programs need to effectively implement WQS—especially narrative criteria—to ensure protection of downstream waters.

- **First focus on downstream protection in priority situations.**
  When considering the development of uses and criteria that ensure the attainment and maintenance of downstream WQS, states/tribes may wish to first focus their efforts on situations where downstream impacts may be greatest to make the best use of available resources. Priority situations will likely vary from state to state or tribe to tribe, and may include those in which:
  - the pollutant accumulates over time in downstream waters (e.g., nitrogen or phosphorus); is persistent (i.e., resists degradation) in the environment (e.g., lead, mercury, arsenic, PCBs, dioxin); is bioaccumulative in aquatic life, wildlife, or humans (e.g., methylmercury); and/or transforms into a more toxic form downstream (e.g., some pesticide metabolites or disinfection byproducts);
  - downstream waters are protected by more stringent or additional criteria;
  - drinking water intakes exist downstream;
  - cumulative impacts are known to occur downstream;
  - environmental justice[5] issues are relevant (e.g., human subpopulations disproportionally at risk exist downstream);
  - sensitive or rare aquatic species (e.g., state- or federally-listed threatened or endangered species) and/or species with particular economic or social importance exist downstream;
  - contentious cross-jurisdictional issues related to downstream water quality exist and coordination may be called for;
  - waters with special use designations and/or protections exist downstream and/or upstream (e.g., headwaters, low order streams);
  - downstream waters are on a state's CWA section 303(d) list of impaired and threatened waters for the relevant pollutants; and/or
  - numeric criteria for the relevant pollutants have been adopted downstream.

- **Choose an approach to develop uses and criteria that ensures the attainment and maintenance of downstream WQS, and document the decision and corresponding analyses.**
  Depending on the situation, it may be appropriate to pursue adoption of a narrative or numeric criterion (or a combination) for downstream protection. In many situations, a narrative downstream protection criterion that provides general coverage could be sufficient. However, in some priority situations (see above for potential examples), states/tribes may wish to consider a more tailored and specific narrative criterion and/or a numeric criterion for specific water bodies or pollutants (for more information, see response to Question 3, *What are possible criteria development approaches for ensuring the attainment and maintenance*

[5] For more information visit the EPA's environmental justice website: http://www.epa.gov/compliance/ej/index.html.

of downstream WQS?). In either case, share with the public a written summary and any related analyses of how attainment and maintenance of downstream WQS was considered during the development of upstream uses and/or criteria, including information supporting how the selected approach demonstrates that such protection is ensured. This summary should be included as supporting documentation for a state's WQS submission, in accordance with 40 CFR 131.5 and 131.6.

Similarly, in designating new or revised upstream uses (e.g., after removing a use consistent with a use attainability analysis, or UAA), the state/tribe should include information on the state's/tribe's consideration of the applicable downstream WQS. Specifically, when designating or revising upstream uses specified in CWA section 101(a)(2), or subcategories of such upstream uses, this information should include how the state's/tribe's new or revised upstream uses (and associated criteria) will continue to demonstrate protection of existing or designated uses of downstream waters. States/tribes must designate any new or revised upstream use taking into consideration the needs in the immediate water (i.e., the upstream water) as well as the WQS of the downstream waters.

However, 40 CFR 131.10(b) does not require a state/tribe to retain a use in an upstream segment that has been demonstrated through a use attainability analysis to be unattainable, solely to satisfy the requirement of 40 CFR 131.10(b). Where an upstream use is demonstrated to be unattainable because the water quality necessary to support the use cannot be achieved, then the attainable water quality and consequently the attainable use in the downstream segment may also be limited by the attainable water quality in the upstream segment, taking into consideration mitigating factors such as flow, dilution, and pollutant degradation. Where an upstream use is shown to be unattainable due to physical conditions, an attainable use may be established instead, but numeric or narrative criteria should also be established that provide for the attainment and maintenance of the (potentially more stringent) water quality standards assigned to downstream waters.

- **Consider the spatial extent of potential impacts on downstream WQS.** Downstream impacts of upstream uses and criteria should be considered as far downstream as adverse impacts are observed or expected to occur from upstream pollution (including hydrologic flow alteration[6]). Just how far downstream a loading of pollutants (or effects from hydrologic flows) could affect the attainment and maintenance of WQS depends on a number of variables, including the nature of the pollutants (e.g., fate and transport properties), upstream and downstream flow volumes, inputs from other sources/tributaries, and the distance/travel time to downstream water bodies with additional or more stringent criteria and/or uses requiring additional protection. Network[7] or fate-and-transport modeling can be useful for delineating the spatial extent of potential impacts. See response to Question

[6] EPA is including impacts from hydrologic flow alteration as states/tribes are increasingly choosing to adopt criteria for the protection of hydrologic flows. Thus, particularly where a state/tribe has approved hydrologic flow criteria in their WQS, EPA considers 40 CFR 131.10(b) to apply.

[7] A network model using the Strahler number is a simple approach (e.g., the point at which the flowing water body segment with a Strahler number n flows into another water body with a Strahler number n+2) that may be useful. (Strahler, A. N. (1957), "Quantitative analysis of watershed geomorphology", Transactions of the American Geophysical Union 38 (6): 913–920)

3, *What are possible criteria development approaches for ensuring the attainment and maintenance of downstream WQS?* for more information regarding numeric and narrative approaches to the development of upstream criteria that are protective of downstream waters.

- **Consider antidegradation requirements of downstream waters during development of upstream designated uses and water quality criteria.**

  When developing or revising designated uses and/or water quality criteria, it is important to consider antidegradation requirements of downstream waters. Consideration of "Tier 1" requirements (i.e., protection of existing uses) in downstream waters is most pertinent when the existing use of a downstream water body is "higher" or "better" than its designated use. (For example, the designated use might be "limited aquatic life" but the existing use could be described as "full aquatic life," a use that might require more stringent criteria.) In such cases, it is important to consider the existing use downstream, in addition to the designated uses and water quality criteria. One way that protection of existing uses can be facilitated is by ensuring that the designated use is revised to reflect any higher or better existing use.

  When states/tribes located upstream are evaluating their own antidegradation requirements for high quality waters, they should also consider the attainment and maintenance of the antidegradation requirements of states/tribes located downstream. Where downstream high quality waters ("Tier 2") and/or "Outstanding National Resource Waters" ("Tier 3") exist, this will likely call for coordination between upstream and downstream states/tribes to ensure that high quality downstream waters are appropriately protected.

3. What are possible criteria development approaches for ensuring the attainment and maintenance of downstream WQS?

Adoption of narrative criteria or numeric criteria (or both) that are protective of downstream waters are viable options under 40 CFR 131.10(b). States/tribes have discretion in choosing their preferred approach. The EPA expects that many states/tribes will consider using a combination of narrative and numeric criteria depending on their circumstances.

In some situations, a broad narrative criterion approach may be advantageous, as such an approach is quickly and easily developed and provides basic legal coverage for a variety of water bodies and pollutants or hydrological flow alteration. Narrative criteria approaches are adaptive, allowing for protection of downstream WQS in a changing environment where loads (either pollutant concentrations or hydrologic flows or both) from different sources may change over time. States/tribes may also wish to consider a more tailored narrative criteria approach that is specific to their unique circumstances (e.g., for certain water body types or certain pollutants). A state/tribe could have several tailored narratives that, for example, include a narrative criterion for streams to protect downstream lakes or a narrative criterion that is specific to recreational criteria where the downstream jurisdiction has adopted more stringent criteria. Tailored narratives may include more details to guide implementation programs, such as including language on whether the state/tribe intends to protect downstream waters through utilizing mass balance or modeling approaches or describing the spatial extent to be covered by the provision.

The EPA's narrative downstream protection criteria templates[8] may be used to assist states/tribes in developing either broad and/or tailored narratives. However, it is important to note that a broad narrative criterion approach (and to a lesser extent, a tailored narrative criteria approach) does not obviate the need to interpret the narrative standard quantitatively in permits or TMDLs, as such an approach does not provide the same degree of specificity regarding specific endpoints as compared to a numeric criteria approach.

Numeric criteria approaches to downstream protection are more straightforward in terms of implementation in permits, assessment of waters, and TMDLs and will likely reduce workload on these programs. However, numeric criteria tend to be more data- and analysis-intensive to develop and would thus likely impose an additional workload on state and tribal WQS programs. Also, numeric approaches may need to be developed on a specific spatial scale (e.g., ecoregional, watershed-specific, site-specific). Additionally, the EPA recognizes that it may be resource intensive for upstream states/tribes to develop numeric criteria to ensure attainment and maintenance of all downstream WQS. As stated above, states/tribes have discretion in how to address 40 CFR 131.10(b), including the option to adopt a broad narrative downstream protection criterion, possibly in combination with one or more tailored narrative and/or numeric criteria that are specific to the unique circumstances of the pollutant and/or water body.

Where feasible, states/tribes are encouraged to adopt numeric criteria to protect downstream waters for accumulative pollutants (e.g., nutrients, bioaccumulative toxics).

Although the criteria approaches described below are not exhaustive, states may consider and use one or more of the following approaches to ensure attainment and maintenance of downstream WQS[9].

a. NARRATIVE APPROACH

- **Adoption of one or more narrative upstream criteria that are protective of downstream waters, pursuant to which assessment can be performed and control actions can be developed to ensure the attainment and maintenance of the WQS applicable to downstream waters**.
  Under this approach, one or more narrative upstream criteria can be written to reflect a quality of water that ensures the attainment and maintenance of downstream WQS. Such criteria(on) should provide a strong basis for implementation via water quality management actions (e.g., in NPDES permitting, Section 401 certification, TMDL programs, and Section 305(b)/303(d) assessment/listing programs). A broad narrative criterion may be a good option for providing basic legal coverage for downstream waters, and/or for situations where states/tribes are planning to embark on development of numeric criteria for downstream protection and need coverage in the interim. Additionally, a more tailored or customized (set of) narrative criterion(a) may be useful when site-specific or site-dependent criteria are in place, or unique water bodies or special circumstances exist downstream. Again, a narrative criterion should facilitate the establishment of effluent limitations, assessment and listing of

[8] http://water.epa.gov/scitech/swguidance/standards/narrative.cfm

[9] As a reminder, regardless of the approach(es) selected by a state/tribe, the EPA notes that to be effective for CWA purposes, criteria must be adopted pursuant to state law and approved by the EPA.

impaired waters, and development of TMDLs, and ensure consideration of the antidegradation requirements of downstream waters. Therefore, states/tribes should consider customizing their narrative downstream protection criteria so that such criteria, and any associated translators or policies, include directions on the following:

- Applicable pollutant parameters, downstream water bodies, and/or conditions (e.g., hydrological, seasonal, or ecological conditions);
- A discussion of what are (or how to identify) the applicable stream segment endpoint(s) for permit writers to use in developing permit limits, or how such endpoints are determined;
- The use of water quality modeling to derive effluent limits in permits that ensure compliance with WQS in downstream waters; and
- Accounting for other pollutant sources when determining effluent limits, e.g., by 1) utilizing watershed models that can account for multiple pollutant sources, including nonpoint sources, and/or 2) retaining assimilative capacity for other sources downstream by using a limited percentage of the receiving water body flow.

States/tribes should also ensure that any mixing zone policy is not inconsistent with such narrative criteria[10].

b. NUMERIC APPROACHES[11]

Some of these numeric approaches are good candidates to pair with a broad narrative downstream protection criterion so that far-field downstream effects can be addressed more directly where appropriate.

- **Consider whether upstream uses are protective of downstream uses, and where appropriate, revise upstream uses and/or put in place numeric criteria to provide for the attainment of downstream uses.**
  This approach would entail identifying sensitive downstream water bodies or water body types protected by more stringent or additional numeric WQS, and considering what upstream use and/or numeric criteria would provide for the attainment and maintenance of that downstream use. There may be situations where this approach to developing numeric criteria is not appropriate, e.g., where different natural aquatic habitats lend themselves to different use designations. Upstream criteria more stringent than the criteria downstream may need to be considered when the pollutants to which they apply are accumulative (e.g., nutrients, bioaccumulative toxics).

[10] The EPA notes that it reads the phrase "In designating uses of a water body and the appropriate criteria for those uses" in 40 CFR 131.10(b) to include mixing zone provisions as such provisions are considered general policies under 40 CFR 131.13 that are reviewed by the EPA for consistency with 40 CFR 131.11, the EPA's water quality standards implementing regulations for water quality criteria.

[11] The EPA notes that where numeric approaches rely on the use of models to establish a numeric downstream protection criterion, it is possible that if a TMDL is ultimately developed for such a water body using different or more complex modeling, there may be a need to reconcile or revisit the numeric downstream protection criterion for that water body based on the updated modeling to ensure that it remains consistent with 40 CFR 131.10(b).

- **Establish downstream protection values at strategic locations (e.g., according to prioritization considerations under Question 2) using water quality modeling applications.**
  Watershed and water quality modeling can be used to determine numeric criteria that the EPA refers to as downstream protection values, or DPVs. DPVs are numeric water quality criteria (with magnitude, duration, and frequency), developed in tandem with upstream criteria and designated uses, which are derived to ensure attainment and maintenance of downstream WQS. States/tribes may choose to establish DPVs at strategic locations, such as the mouths of specific tributaries to estuaries, lakes or rivers, or other locations where numeric water quality criteria may be key to efficiently protecting downstream water quality through effective management decisions upstream (e.g., derivation of effluent limitations, via modeling, to prevent exceedance of the DPV).

  An example of this approach can be found in the DPVs for nutrients that the EPA developed for Florida streams that protect downstream lakes from the associated effects resulting from eutrophication[12]**.** The pour point to a more sensitive downstream water body is a natural choice for a location at which to measure water quality, and all contributions from the stream network above this point in a watershed may affect the water quality at the pour point. DPVs may also be established in upstream locations to represent sub-allocations of the total allowable loading or concentration. Such sub-allocations may be useful where there are differences in hydrological conditions and/or pollutant sources in different parts of the watershed.

- **Use water quality modeling approaches to determine what upstream criteria ensure the attainment and maintenance of the WQS in downstream waters.**
  Numeric water quality criteria that are protective of downstream waters can foster clear and effective cross-program and cross-jurisdictional communication, consistency, and efficiencies. When developing upstream criteria that are protective of more sensitive or at-risk downstream waters, this option would entail first identifying one or more of the following:
    - Downstream water bodies subject to more stringent or additional WQS;
    - Downstream water bodies in which specific pollutants will accumulate or transform; and
    - The relevant standard(s) of those waters in a downstream state, tribe, or territory.

  Once downstream water bodies are identified, watershed and/or water quality modeling (using modeling applications such as WASP[13], AQUATOX[14], BASINS[15] and BATHTUB[16]) can be performed to determine upstream criteria that will provide for the attainment and maintenance of the downstream WQS. When determining whether and how to model the

[16] Walker, W. W. Jr., 1996, Simplified Procedures for Eutrophication Assessment and Prediction: User Manual," Vicksburg, MS: U.S. Army Corps of Engineer Waterways Experiment Station, Instructional Report W-96-2 (updated April 1999).

downstream levels and effects of a pollutant, some technical considerations include: the type of pollutant, chemical/physical/biological effects of the pollutant, fate and transport/in-stream processes, seasonality, sources of dilution, and synergistic or cumulative effects with other sources/tributaries.

If use of a water quality modeling application is infeasible, it can be useful to develop a simple mass balance model by mapping the streams within the watershed being considered. To help determine what upstream criteria will be protective of downstream standards, consider using field data (or data from national databases such as the EPA's Water Quality Portal[17] and NPDAT[18]) or estimates (e.g., from NHDPlus Version 2[19], Manning equation, other applicable equations, etc.) of flow volume and velocities, monitoring data on pollutant concentrations, and available information on fate and transport characteristics (e.g., decay factors or attenuation coefficients).

- **Use other approaches to develop numeric criteria that are protective of downstream uses, where data or resources are insufficient to support water quality modeling.** If sufficient data or resources are not available, approaches that do not require water quality modeling can be used to develop criteria that are protective of downstream uses. These approaches are:
    - Use the criterion of the downstream water body as the criterion applicable at the pour point of the upstream tributary into the downstream water body.
    - Use regression or other statistical methods to relate downstream pollutant concentrations to upstream pollutant concentrations and determine the upstream concentration protective of the downstream WQS.
    - Derive a reference condition-based criterion by using stream loads or concentrations that are spatially linked to and temporally coincident with the downstream water body during periods when that downstream water body is attaining its designated use or water quality goal (e.g., existing water quality).

  An example of the third approach can be found in the Delaware River Basin Commission's (DRBC's) Special Protection Waters Program. In that program, to prevent degradation of existing water quality in the Delaware River Basin, DRBC characterized the existing water quality at 'control points' on select tributaries near their pour points to the Delaware River (called Boundary Control Points, or BCPs) and on the Delaware River itself (Interstate Control Points, or ICPs)[20]. The BCPs represent water quality from tributary watersheds and the ICPs integrate information on the water quality of their cumulative upstream tributary drainage. This design facilitates the calculation of permit limits, via modeling, that protect receiving water quality as well as the quality of downstream sections of the Delaware River. Segmentation of the Delaware River basin into manageable, site-specific control points also aids the design of monitoring plans to evaluate the effectiveness of controls.

4. What other flexibilities, tools, and approaches are available for states/tribes to consider?

- **When protection of downstream WQS results in more stringent upstream criteria values, variances can be one mechanism for attaining protective criteria over time.** The federal WQS regulation at 40 CFR 131.13 authorizes states, at their discretion, to "include in their [s]tate standards, policies generally affecting their application and implementation, such as mixing zones, low flows and *variances*. Such policies are subject to EPA review and approval." (emphasis added). The EPA describes a variance as a time-limited change to designated use and criteria that targets a specific pollutant(s), source(s), and water body(ies) and/or water body segment(s)[21]. Variances are different from revisions to designated uses in that variances are time-limited and intended to provide time for states, dischargers, and/or other stakeholders to implement adaptive management approaches to improve water quality and ultimately attain the designated use[22].

  As discussed in the response to Question 2, 40 CFR 131.10(b) does not require a state/tribe to retain a use in an upstream segment that has been demonstrated through a use attainability analysis to be unattainable, solely to satisfy the requirement of 40 CFR 131.10(b). Where an upstream use is demonstrated to be unattainable because the water quality necessary to support the use cannot be achieved, then the attainable water quality and consequently the attainable use in the downstream segment may also be limited by the attainable water quality in the upstream segment, taking into consideration mitigating factors such as flow, dilution, and pollutant degradation. Where an upstream use is shown to be unattainable due to physical conditions, an attainable use may be established instead, but numeric or narrative criteria should also be established that provide for the attainment and maintenance of the (potentially more stringent) water quality standards assigned to downstream waters.

  By design, a variance reflects the highest attainable uses and associated criteria[23]. The EPA recognizes that the water quality associated with the highest attainable use and criteria may still cause or contribute to an impact downstream during the time period of the variance. However, since a variance establishes a timing mechanism to ensure feasible progress is made to improve water quality towards meeting the underlying designated use and criteria, a variance is expected to only result in improving water quality over time and lessening any adverse impact to downstream water quality standards.

- **Use existing TMDLs on downstream waters to help determine what pollutant concentrations in upstream waters are expected to provide for the attainment and maintenance of downstream WQS.**

---

[21] For additional information on WQS variances, also see *Discharger-Specific Variances on a Broader Scale: Developing Credible Rationales for Variances that Apply to Multiple Dischargers* (March 2013, EPA-820-F-13-012, http://water.epa.gov/scitech/swguidance/standards/library/) and the EPA's *Water Quality Standards Handbook* at http://www.epa.gov/wqshandbook as well as the background discussion on variances in the Water Quality Standards Regulatory Clarifications Proposed Rule (78 FR 54518, September 4, 2013) at http://www.gpo.gov/fdsys/pkg/FR-2013-09-04/pdf/2013-21140.pdf (see pp. 54531-54536).

[22] 78 FR 54531 (September 4, 2013).

[23] 78 FR 54533 (September 4, 2013).

Ideally, downstream protection should be addressed in WQS prior to a TMDL being developed. However, if an established TMDL has already identified the pollutant loading rates not to be exceeded in a particular upstream water body segment or tributary in order for a downstream water body to attain WQS, this can provide useful information when considering what uses and criteria in upstream waters will provide for the attainment and maintenance of the WQS of downstream waters. States/tribes may also develop a TMDL-like analysis for an unimpaired segment. Such analyses are not subject to EPA approval or disapproval[24].

- **For current WQS, it may be useful to analyze trends in water quality in order to identify situations where adjustments to uses and/or criteria of upstream waters may be necessary to prevent future impairment of downstream water bodies exhibiting adverse trends in pollutant concentrations or hydrologic flows.**
  If water quality in downstream waters is trending over time towards a level of pollutants (or hydrologic flows) that may lead to exceedance of the applicable pollutant criteria in the future, this information can be used to preemptively identify pollutant sources (or sources of changes in hydrologic flows) and determine if one or more upstream criteria needs to be made more stringent to prevent impairment of the downstream water body(ies).

- **Consider stream order as a basis for protecting downstream WQS.**
  Protecting and restoring headwaters and lower order streams can help maintain and/or improve downstream water quality. Water quality managers may want to consider stream order as one factor in prioritizing their resources and deciding where and when to focus their efforts.

[24] Clean Water Act section 303(d)(3) provides "For the specific purpose of developing information, each State shall identify all waters within its boundaries which it has not identified under paragraph 1(A) and 1(B) of this subsection and estimate for such waters the total maximum daily load with seasonal variations and margins of safety, for those pollutants which the Administrator identifies under section [304(a)(2)] as suitable for such calculation and for thermal discharges, at a level that would assure protection and propagation of a balanced indigenous population of fish, shellfish, and wildlife."

Confederated Tribes and Bands
of the Yakama Nation

Established by the
Treaty of June 9, 1855

Director
Washington State Department of Ecology
PO Box 47600
Olympia, WA 98504-7600

Dear Mr. Sturdevant,

Thank you for your invitation to the Delegates Table of the Policy Forum on Washington State's Water Quality Standards rulemaking. However, we are disappointed to see Ecology's change in direction on updating the fish consumption rate to wait for a new administration to fix this issue. Yakama Nation will not be participating in the delegates forum for such an important issue. We expect our concerns to be heard and considered at a much higher level than a "Delegates Table".

In the Treaty of 1855 Yakama Nation reserved the right to clean water and healthy fish. Recognizing federal and state governments were ignoring human health risk to tribal members from pollution in the Columbia River Basin we began work to address this issue. In 1991 collaboration with EPA and CRITFC we planned and participated in a fish consumption survey of the Umatilla, Nez Perce, Yakama, and Warm Springs tribes of the Columbia River. In 1994 the results of our study showed that our people eat significantly more fish than Washington's Fish Consumption Rate, putting tribal people at risk. Yet in 2012, eighteen years after publishing the results of our study, Ecology is still putting off correcting the undue risk to our people and resources.

The Yakama Nation wants an outcome, not just a number. The fish consumption rate that is selected must be protective of all Yakama people, not just a percentage of them. We have voiced our concerns to the state of Washington and federal government with no result.

Yakama Nation does not plan on participating in the delegates table on water quality as we are a sovereign nation, not a stakeholder. This fish consumption rate issue is very important to Yakama Nation and we request a government to government consultation.

Please coordinate this consultation with McClure Tosch. Mr. Tosch can be reached at 509-865-5121 ext. 6413 or tosm@yakamafish-nsn.gov

Sincerely,

Harry Smiskin, Chairman
Yakama Nation Tribal Council

LUMMI INDIAN BUSINESS COUNCIL
2616 KWINA ROAD · BELLINGHAM, WASHINGTON 98226 · (360)384-1489
DEPARTMENT_____DIRECT NO._____

October 8, 2012

Mr. Ted Sturdevant, Director
Washington State Department of Ecology
PO Box 47600
Olympia, WA 98504-7600

SUBJECT: **August 15, 2012 Invitation to Join the Key Delegates Table for the Washington State Water Quality Standards Policy Forum**

Dear Director Sturdevant:

Thank you for your August 15, 2012 letter that provided both an overview of the Department of Ecology's current efforts to improve the Washington Water Quality Standards relating to human health risk exposure, including updating the fish consumption rate, and inviting tribal participation as a member of the "Key Delegates Table" of a newly created Policy Forum. In response to your letter, I have the following comments:

1. Please include the recently completed Lummi Nation Seafood Consumption Study in the Ecology report that documents the most relevant fish consumption rate studies in Washington. Craig McCormack of your staff provided helpful comments following his quick review of a draft version of that study. The final report, which addressed comments received from the Tribal Advisory Committee and the Technical Advisory Committee for the study as well as other comments, is available on line at: http://lnnr.lummi-nsn.gov/LummiWebsite/Website.php?PageID=211. The Tribal Advisory Committee for our study recommended that the Lummi Seafood Consumption rate be no less than the 383 grams/day average rate determined by the study.

2. I agree that it is critical that Ecology receives input from high fish-consuming communities in Washington, particularly tribal governments, as the state fulfills its promise to adopt more realistic and protective fish consumption rates during this triennial review of your water quality standards. However, the Lummi Nation's consultation policy (LIBC Resolution No. 96-156) requires that we forego participation in stakeholder groups unless specifically authorized through a tribal council resolution and participate only in one-on-one, government-to-government forums. Lummi Nation policy representatives are to seek and respond only to a

unified federal position and a unified state position. Once the Policy Forum that you are creating has informed the Washington State position and you have developed the state position, please contact me and we will engage in government-to-government consultation on this matter.

3. We understand that the state has a deliberate rule making process. However, we are concerned that the adoption of more appropriate human health criteria for the Washington State Water Quality Standards is being and will be unduly delayed. Even the most ardent detractors of the need to protect the human health of Washington residents should be able to concede that the current consumption rate used to establish the Washington Water Quality Standards (6.5 grams/day) is neither reasonable nor accurate. The unreasonableness of the current rate is illustrated in Figure 1. A more reasonable and protective rate needs to be adopted in the very near term, not after a multi-year process to find consensus among parties that are unlikely to agree.

   As you know, Oregon convened a Human Health Focus Group as part of their Fish and Shellfish Consumption Rate Project. Three of the six Human Health Focus Group members were either affiliated with the University of Washington or the Washington Department of Health. It seems that Ecology should start with the work conducted already in Oregon, make appropriate adjustments for Washington, and adopt water quality standards that reflect a revised and more protective consumption rate.

I understand that there may be politically difficult decisions to be made. However, I believe that the number of studies conducted to date coupled with the work already performed in Oregon provides a solid foundation for Washington to move forward in an expeditious manner to adopt appropriately protective water quality standards for all Washington citizens.

Sincerely,

Merle Jefferso

Merle Jefferson, Sr., Executive Director
Lummi Natural Resources Department

Cc Dennis McLerran, EPA Region 10 Administrator

Ted Sturdevant, Director
Department of Ecology
POB 47611
Olympia, WA 98504-7611

Dear Director Sturdevant,

I am writing in response to your August 15, 2012 letter to Chairman Lopeman inviting a representative to sit at the Key Delegates Table for a Fish Consumption Rate Policy Forum.

The Squaxin Island Tribal Council has discussed your invitation and respectfully declines to participate. The Clean Water Act requires a fish consumption rate protective of human health and we have sufficient, solid science to move ahead without further delay. We want action, not further discussion.

Thank you for your consideration.

Sincerely,

Andy Whitener
Natural Resources Director

RE: August 15, 2012 Invitation to Join the Key Delegates Table

Dear Mr. Sturdevant:

The Kalispel Tribe of Indians respectfully declines your invitation to join the Key Delegates Table for the Washington State Water Quality Standards Policy Forum. As a sovereign nation, we will not participate in a forum that treats the Tribe as a mere stakeholder and does not afford proper respect to the Tribe's sovereign input. We also do not support a political process that condones further delay in adopting water quality standards that protect Kalispel and other people who eat significant amounts of fish.

As you engage in yet another round of dialogue with the regulated community, please be mindful of the practical consequences of the Department of Ecology's inaction. Ecology's current fish consumption rate ("FCR") of 6.5 g/day has never been protective of people who eat large amounts of fish. For some of these fish consumers, the elevated health risk that they have faced for years has turned or will turn into cancers and other actual health problems. While it is unfortunate that 1 in a million people from the general population will develop cancer due to the amount of fish that he or she eats, it is unconscionable when government knowingly subjects Indians and other highly exposed sub-populations to a much higher cancer risk. Ecology has known for almost two decades that its current FCR is underprotective, and further delay is unacceptable. Even as I write these words, Ecology is in the process of reissuing an NPDES permit to a discharger directly upstream of Kalispel waters based on an FCR of 6.5 g/day. Existing regional fish consumption surveys provide Ecology with ample data to support a more protective FCR. Ecology need only develop the political willpower to protect the citizens of Washington.

The Kalispel Tribe is in the process of exerting its sovereignty to protect all tribal members from elevated health risks due to their fish consumption within Kalispel waters and anticipates submitting revised water quality standards to EPA by year's end. The Tribe would welcome the opportunity to share its expertise with Ecology, but only in a forum that respects the Tribe's sovereignty and affords the requisite sense of urgency to adopting a more protective fish consumption rate.

Sincerely,

Glen Nenema

Glen Nenema, Chairman

PORT GAMBLE S'KLALLAM TRIBE
31912 Little Boston Rd. NE – Kingston, WA 98346

October 12, 2012

Ted Sturdevant
Director
Washington State Department of Ecology
P.O. Box 47600
Olympia, WA 98504-7600

Dear Director Sturdevant,

Thank you for your August 15th, 2012, letter and invitation regarding the process for setting more appropriate fish consumption rates (FCR) for Washington's Water Quality Standards. We understand that this process includes convening a Policy Forum to inform rulemaking work for improving Water Quality Standards and that the Key Delegates Table of the Fish Consumption Rate Policy Forum will be considered the core of the Policy Forum.

While I appreciate the invitation for our participation in the Policy Forum via the Key Delegates Table, we are going to respectfully decline our involvement with this group. This is due primarily to our concerns about where this Policy Forum is likely to go and how long it may take for anything to come out of it. The fact is that we, and most other Puget Sound Tribes, are unhappy with the delay in this FCR process, and think Ecology should use the clear and available science in your existing consumption rate report to move forward immediately. So we are hereby requesting a government-to-government consultation and appreciate that you included that invitation as well. We will follow up with Tom Laurie on setting up this G2G consultation meeting.

As you may know, Paul McCollum, our Natural Resources Director, is a member of EPA's Region 10 Tribal Operations Committee (RTOC) representing western Washington Tribes and we have worked closely with other Washington Tribes in recent discussions with Dennis McLaren about this FCR issue. Rory O'Rourke, our Environmental Scientist, has also written an article on the matter, which you may have seen. We are fully engaged in this issue at so many levels.

We are very supportive of the recent Affiliated Tribes of Northwest Indians (ATNI) resolution #12 – 54 which advises EPA to immediately establish a revised minimum rate of no less than 175 grams per day. We will work hard in collaboration with the RTOC and NWIFC and EPA Region 10 to encourage EPA to quickly adopt this new minimum rate. This will then be very useful such that EPA will be able to force this minimum consumption rate for states such as Washington that have unjustifiably low rates, to use EPA's new rate until they can get their rate revisions done for their respective Water Quality Standards.

It is unfortunate that Ecology used the SMS approach for the initial FCR process rather than directly with the WQS, but we appreciate that you are now moving forward with both the SMS and SWQS. We are happy to note that in both your letter of August 15th and your

letter of September 25th, 2012 to Dennis McLerran in response to his letter of September 6th, 2012 that you are accelerating the process and timelines for this important fish consumption rate revision.

The science is in hand already for Ecology to implement these critical FCR revisions for the Water Quality Standards. So rather than go into a long formal stakeholder process that could easily get politicized and have too many involved that are against a FCR revision whatsoever, we would like to see things happen on a much quicker time scale.

It is our recommendation that Ecology immediately implements the fish consumption rate of 212 grams per day, which is the median of the Preliminary Recommendation of 157 to 267 g/day in Ecology's "Fish Consumption Rates Technical Support Document, A Review of Data and Information About Fish Consumption in Washington" Version 1.0 dated September 2011 (Publication no. 11-09-050). The science is solid enough to support this range that was derived after collaboration between Ecology staff, meetings with Tribes, and the use of Tribal consumption studies. Therefore, the median of the range seems like the best approach to get this FCR revised immediately, and then work on a review and update in three to five years.

We are disappointed the version 2.0 of this document was changed so drastically and does not even have a recommended range.

We look forward to a government-to-government meeting and consultation and hope to get an update and provide some more detailed input at that time.

Sincerely,

Jeromy Sullivan, Chairman

RE: Water Quality Standards Policy Forum Invitation

Dear Mr. Sturdevant:

Thank you for your August 15, 2012 letter inviting me or my designee to participate in a Policy Forum being organized by the State of Washington that will address the State's water quality standard revisions. Your letter described a Policy Forum that includes many types of "stakeholders" that have an interest in the State's water quality standards. As a sovereign regulator, the Tribe will not participate in Policy Forum that includes multiple non-sovereign entities and "stakeholders." The Tribe fully expects Ecology to discuss these important changes on a government-to-government level.

Additionally, the Policy Forum appears to be designed to address Ecology's complete change of course from adopting an appropriate and legal fish consumption rate (FCR) as part of its water quality standard changes in the near term to a delayed path of further regulatory uncertainty. This regulatory uncertainty will cause further degradation of the Tribe's waters. Simply put, the Tribe is not a "stakeholder," it is a sovereign regulator and has no interest in discussing these matters in an forum that appears to be designed to perpetuate Ecology's further delay on this important topic as discussed below.

The health and well-being of the waters that flow through the Spokane Tribe's reservation are a paramount interest of the Tribe. The Tribe is concerned not only with the health of the portion of the rivers and creeks within its Reservation, but also with the entirety of these waters as they flow through the Tribe's ancestral lands. The Reservation's southern boundary is set to the south bank of the Spokane River, the Western Boundary is set by the West Bank of the Columbia River and the Eastern Boundary is set to the East Bank of Tshimikain Creek, the borders were set in this manner to protect the Tribe's subsistence and cultural uses of these waters, and the Tribe will do whatever is necessary to protect its fundamental rights in these waters.

For many decades the Tribe's subsistence use of its rivers and creeks have been thwarted by upstream pollution, raised water temperatures, and during certain times of the year portions of its waters are uninhabitable for aquatic life due to depressed oxygen levels and high levels of total dissolved gas ("TDG"). Additionally, PCBs and other toxins make fish consumption potentially dangerous to human health and negatively affect the Tribe's use of its resources. In response to this infringement on the Tribe's fishing, cultural, and agricultural rights in its water bodies, the Tribe applied for and received treatment in the same manner as a state status ("TAS") under the Clean Water Act ("CWA"), 33 U.S.C. § 1377, on July 23, 2002. The Tribe's first water quality standards were approved on April 22, 2003. These first standards included a FCR of 86.3 grams per day, and recently, the Tribe updated its standards to include a more protective FCR which is currently pending EPA review. This new standard recognizes the Tribe's historical and rightful FCR which it is entitled to within its waters. Additionally, this higher FCR will help prepare the Tribe's waters for the return of anadromous fish when passage is achieved at Grand Coulee Dam.

Unfortunately, projects to improve water quality and control water pollution within the Reservation have not been successful in bringing the Tribe's waters back to health due to upstream pollution and hydropower facilities. The Tribe's current approved FCR of 86.3 grams per day is significantly above Washington's 6.5 grams per day and this difference is causing significant trouble in the Tribe's attainment of its WQS. Currently, the Tribe's waters are affected by multiple upstream point sources and stormwater pollution that operate under permits written pursuant to Washington's current FCR. This is done even though EPA regulations require that the permits be written in a manner that ensures downstream standards are met. Unfortunately, these regulations are ignored by Ecology and EPA which indicates to the Tribe that short of litigation what is really needed is for Ecology to quickly adopt an appropriate FCR that protects downstream water quality standards of Tribes and the State of Oregon.

In conclusion, there are multiple valid fish consumption studies for the waters of the State, and federal regulations that require the State to adopt standards that do not degrade downstream waters. Accordingly, the State should stop delaying and adopt a legal FCR as soon as possible. Should you have any questions or wish to arrange a government-to-government meeting, please contact B.J. Kieffer, Director of the Spokane Tribe Natural Resources Department at 509-626-4427.

Sincerely,

for Rudy Peone

RE: Response to Delegates Table Invitation – Fish Consumption Rates

Dear Mr. Sturdevant:

The Suquamish Tribe ("Tribe") received your letter, dated August 15, 2012, describing Ecology's revised approach to the adoption of fish consumption rates ("FCR") in state standards for water quality and toxic cleanup, and offering an invitation to participate in a "Key Delegates Table at a Policy Forum." The Tribe remains committed to supporting the development of environmental standards that incorporate fish consumption rates that are protective of tribal people. Ecology's new strategy, however, delays the adoption of a more accurate fish consumption rate and leaves the resolution of this essential step to an undefined stakeholder process and schedule, without the support or the commitment of future State of Washington administrations. More importantly, it fails to address a cohesive process to reduce the risks to tribal members and treaty trust resources associated with current water quality and toxic cleanup standards.

The Department of Ecology has known for years that the current fish consumption rates do not protect Washington residents—and that tribal communities are at particular risk of toxic exposure because of their traditionally high consumption rates. Numerous studies and surveys, including the August 2000 *Fish Consumption Survey of the Suquamish Indian Tribe Of The Port Madison Indian Reservation, Puget Sound Region*, demonstrate that the current consumption rate used to establish Washington Water Quality Standards (6.5 grams/day) is neither accurate nor protective. While the tribes, EPA and Ecology recognize the validity of this information, little substantive progress has been made to address the inadequacies of the current consumption rate and regulatory standards that are intended to be protective of human health. Indeed, the same tribal health issues related to fish consumption were raised a decade ago during the 2002-2003 review of state water quality standards.

To move forward on these issues, tribes have continued to work with the Department of Ecology over the last several years, and were repeatedly assured by Ecology that at a minimum Ecology would move to revise FCRs in guidance and incorporate the revised FCRs in the sediment management standards before the completion of the current state administration's term. In July 2012, and presumably under political pressure from industry, Ecology abruptly reversed its course and decided not to revise the FCR to incorporate a more protective rate into state standards, without consultation with the tribes or

other stakeholders.

Ecology's about face strategy undermines the significant effort and resources that many tribal governments have devoted to working with Ecology for the purpose of documenting the technical basis for revising the fish consumption rate and to develop health protective sediment and water quality standards for the state. Ecology's recent actions do not meet the intent of government-to-government consultation to provide for meaningful participation in the decision-making process. For these reasons, the Suquamish Tribe will not be participating as a stakeholder in the delegates table policy forum.

The Tribe, however, intends to continue to engage with Ecology on a government-to-government level, as the appropriate forum to discuss key issues, as long as tangible progress toward adopting protective standards is being made. The Tribe urges Ecology to proceed, without additional delay, to finalize the technical guidance document recommending a range of protective consumption rates; amend the sediment standards to include a consumption rate at or above the rate (175 grams/day) recently adopted by Oregon and approved by EPA; and adopt human health-based criteria including a revised consumption rate in the state water quality standards.

We look forward to making measurable progress on this issue with the intent to protect the health of tribal and non-tribal people as well as the environment without further bureaucratic delay. If you have any questions, please contact me at (360) 394-8461 at your convenience.

Sincerely,

Leonard Forsman, Chairman
Suquamish Tribe

Re: Invitation to Join the Key Delegates' Table for the Washington State Water
Quality Standards Policy and Technical Forums

Dear Director Sturdevant,

I am writing today to provide additional clarity from the Swinomish Indian Tribal Community ("Swinomish") regarding the State process for revising water quality standards for toxic pollution to protect human health in Washington State.

Swinomish has strong misgivings that the Washington State Department of Ecology ("Ecology"), as well as the Governor's Office, will take strong and effective action to promulgate more accurate (and thus protective) water quality standards and associated human health risk exposure parameters, such as the fish consumption rates, which are much needed and long overdue policy revisions. As stated by myself and many fellow leaders, the "can has been kicked down the road by this Administration," and the State's present decision has once again proven that they cannot uphold its responsibility nor its commitment to provide a healthy and safe Puget Sound. For us, this is a serious concern not only for the human health of our citizens but for the sustainability of our treaty resources and rights.

Although Ecology started out with great strides six (6) years ago to uphold its mission "to protect, preserve, and enhance Washington's environment" as well as Chapter 173-201A WAC: Water Quality Standards for Surface Waters of the State of Washington. The stated purpose of which is to "establish water quality standards for surface waters of the state of Washington consistent with public health and public enjoyment of the waters and the propagation and protection of fish, shellfish, and wildlife…,". Since then, however, we've witnessed that both of the Governor's Ecology Directors, Jay Manning and yourself, have failed on the commitment to update a fish consumption rate and adopt water quality standards that are truly protective of human health.

With these concerns in mind, Swinomish ardently declines Ecology's invitation to participate in both the technical and policy forums. As a federally recognized Native American tribe, we will continue to work with our federal trustee, the United States Environmental Protection Agency ("EPA"), to establish a government-to-government consultation and process for any continued discussions regarding the rule-making revisions.

Under the Centennial Accord, we will strive; to establish a government-to-government relationship with the newly elected Governor's Office and a newly appointed Director of Ecology, to create a new pathway based on the current sound science, and to attempt to advance a fish consumption rate as part of the sediment management standards and water quality standards. The reality is that the Department of Ecology's current planis woefully inadequate to accomplish what the Tribes are seeking unless the Governor adopts an accurate fish consumption rate that protects the health of the United States citizens of no less than 175 gpd, moves the Water Quality Standards into the CR 102 phase and adopts the Sediment Standards with the fish consumption rate and a health criteria.

At the end of the day, the Swinomish Indian Tribal Community will continue to invest our time in building broad support for the passage of water quality and sediment standards that will ensure that the health of not only our citizens, but all Washington State citizens, is not put in jeopardy by the almighty dollar.

Respectfully,

Brian Cladoosby

Subject: Tribal Fish Consumption Workgroup Mtg. scheduled for this Thursday, October 13, 10AM - 12:30PM

Hello, All:

We have a **Fish Consumption Technical Workgroup** meeting scheduled for **Thursday, October 13 from 10:00 to 12:30**. The meeting will be held at the Jamestown S'Klallam Tribal Center, Alderwood Room in Blyn. For those who want to join by phone, teleconferencing will be available, a call-in number and instructions will be forthcoming.

The purpose of the meeting is to:

1. Introduce Ann Seiter as the new coordinator for the FCR Project and review her workplan (attached).
2. Discuss our approach for reviewing the Ecology technical report, available at www.ecy.wa.gov/biblio/1109050.html
3. Review and update our Fish Consumption Workgroup distribution list.
4. Prioritize next steps.
5. Schedule next workgroup meeting

Below is the list for the Tech Work Group as it reads now:

Tribal Fish Consumption Workgroup			
Name	**Email Address**	**Organization**	**Phone Number**
Nancy Rapin	Nancy.Rapin@muckleshoot.nsn.us	Muckleshoot Tribe	(253) 876-3128

Tribal Fish Consumption Rate Technical Work Group and
Other Interested Parties

Attached is an agenda for the meeting of the Fish Consumption Rate Technical Work Group on Monday, November 21, 2011 from 10 am to 12:30 pm. The meeting will be an in-person meeting at the NWIFC conference center. We have video link-ups available at the North Sound Office or Forks, but not at the Point No Point Treaty Council offices.

We have also set up a call in number for the meeting at 206-553-1454 for those of you who are unable to attend but would like to listen in. We have had so much trouble with poor connections and background noise that we request those of you who will be calling in to mute your phones as much as possible. I apologize in advance if it is difficult for you to hear. I am also attaching the powerpoint presentation that Craig McCormack from the WA Department of Ecology will be using for those of you who cannot be at the meeting in person.

I will try to stick to the times in the agenda as much as i can. There is another meeting in the facility after we adjourn so we have a tight timeline. Thanks for your cooperation in this.

Several key members of the technical work group have already confirmed that they will attend in person. No one has indicated an interest in going to the video link sites so I have cancelled the one at Point No Point so far. If you will be using a video site, please let me know as soon as possible. Thanks.

I look forward to meeting with you on Monday.

Ann

Hi Teri,
Hope you had some happy holidays. I wanted to give you an update on the proposed attendees for the meeting about Fish Consumption Rates with Ted on January 25th at 1:30. We are expecting the following people at this point:

NWIFC: Dave Herrera (Skokomish), Terry Williams (Tulalip), Andy Whitener and John Konovsky (Squaxin Island), and Shawn Yanity (Stillaguamish). Shawn is stepping in for Russ Hepfer from Lower Elwha, who cannot make it.
EPA: Jim Woods and Mike Bussell
Also in attendance will be myself and Fran Wilshusen.

I will send an agenda and the NWIFC comments to Ecology on this issue when they are ready, but this may not occur until after the next NWIFC meeting on January 18th. Please let me know if you have any questions.

Subject: FCR meeting February 23rd

Hi Teri,
We are still planning on meeting with Ted on the 23rd and representatives are anxious to do so. Fran and I have been working on a draft agenda and calling around for confirmations. We will be going over the agenda at

the NWIFC Environmental Policy Committee meeting on Tuesday, so it isn't quite ready yet, but here is the general framework:

- Review the purpose of the Leadership Group
- Update on current activities related to the FCR--technical support document, input from stakeholders.
- Tribal perspectives on the comments received on the document, messaging, additional technical work and timelines for preparation of responses.
- Review the status and timelines for the rule making processes: SMS and WQS
- Next steps

We expect about 4 policy representatives, and 4 staff from NWIFC or tribes (including Fran and I). We may not have a better headcount until Tuesday's preparatory meeting. Additionally there may be representatives from EPA and tribal policy representatives may want to bring staff. If there will be several Ecology staff present, then the room may be tight.

Let me know if you have additional questions.

Ann
