

Dan De Groot

Compost areas and other areas for solid material storage require very little restrictions. If the area has a slope on it that prevents liquid pooling and the surface of the area is not disturbed that is sufficient to prevent aquifer contamination. Most solids on CAFO's tend to seal soil so there is little risk of contamination. CAFO's usually turn over this material frequently and apply seasonally. There is no need to make overcomplicated and technical regulations to achieve satisfactory results.
