

Craig Baker

My only concerns would be the risks of air, water, and ground pollution risks. Im sure the Dept of Ecology could better assess those risks than I could and weigh the risks versus the benefits of having this facility. Biodiesel is biodegradable. I feel there will be a benefit of processing these items into a commercial product as it will keep decrease these products from otherwise going into landfills. Biodiesel produced by this plant also would reduce petroleum product use to some degree, if not in Washington then within our nation. I believe the Dept of Ecology could find a way to allow the plant to be put in that have minimal risk to the environment. We cannot both want reductions in petroleum dependency while also not allowing alternatives to be created. We have so many groups that dont want anything put in place that may harm the environment but they also dont see that we as humans will never have zero negative impact on the planet.
