

Sharon Sollenberger

I am opposed to the development and operation of a natural gas to methanol production facility at the port of Kalama. The production of millions of tons of CO₂ is not acceptable when we need to be reducing our emissions by 9% for the next 30 years to reduce the impact on climate change. Other cities in the U.S. in California and on the east coast are developing policies to ensure new construction of all electric. In addition there have been incidences of gas companies abandoning wells, leaving them to leak methane. Please consider other cleaner options for producing energy and making products that Washington state and other states and countries need. It is a matter of priorities and doing whatever we can to mitigate global warming is of the utmost urgency.
