

## Tracy Ceravolo

According to a report in Bloomberg, millions of abandoned gas wells around the country are actively leaking methane! Where is the money to monitor this? Are there federal regulations about it? Gas companies declare bankruptcy, and tax payers are left to pay for plugging these wells which can cost hundreds of thousands of dollars per well! And plugging it with concrete is not a permanent solution because the concrete degrades with the extreme pressure of the Earth. So for every well dug, you are dooming future generations to deal with our mess of leaking methane?!

How does this factor into your EIS?
