

Say Yes to Life Swims LLC

This proposed project is an environmental disaster in the making! If built, the Kalama project would unleash more gas, and therefore more fracking, than is used by all of the NW's biggest cities--COMBINED. It would more gas, and therefore more fracking, than is used by all of the power plants in Washington State!

The analysis that petrochemical boosters present is both rhetorically deceptive and analytically wrong. Energy modelers looked at the project forward and backward, right-side up and upside down. What they found is that unequivocally and under every set of assumptions, the project would be one of the top polluters in Washington.

It is beyond foolhardy to even consider building such a horrific project. NO!
