

## Robin Cody

My daughter and granddaughter live in Vancouver WA, just 28 miles south of Kalama. I'm worried first about their safety when it comes to converting natural gas to methane. Both gasses are highly explosive. An earthquake, in particular the overdue "big one" could shoot flames right down the Columbia River shore. What's the point anyway of shipping methane to Asia? The gas is is a notorious contributor to global warming. Please let's not let Washington State export a substance that fuels climate change, the enemy of forest products and clean air.
