

## DEREK DEXHEIMER

The Kalama ethanol plant should not be built. Ecology's own analysis shows the plant would emit a minimum of 4.6 million tons of GHGs annually for 40 years. This level of climate pollution is inconsistent with a livable climate.

In addition, the plant would use fracked gas piped in from other western states, providing a market for this disastrous form of pollution.

Due to its inherently destructive nature, this plant cannot go forward.
