>> This methanol refinery would be going 180 ° in the wrong direction. No more fossil fuel infrastructure. We are beyond that time and considering putting this refinery in one of the largest and most treasured rivers in the nation would be beyond responsible. How to say something about mitigation which is usually the quote unquote solutions NICU are talking about that here. The pocket gopher lives of that land and the brace will be annihilated by building this warehouse. By mitigating the process they will cut down a 70-acre forest in hopes gopher will take up residence there well known that the overhead is very finicky taste in the soils and habitat. And lose the 70 acres of trees and see the cooling, stormwater mitigation in the habitat even though no certainty that it will work and it probably won't. In the state of Washington allows this behavior not because it makes sense so that the corporations can continue to have the upper hand. It is business as usual. It mitigates nothing but destroys and keeps destroying. And cancels the voice of the people who decide it's time to stop living as if money was the only thing that mattered. And that those provide the jobs that we are hearing tested fires here say today that we need so badly. We have had enough, do the right thing, no methanol refinery.
