

# Mary Paterson

>> Yes we can hear you.

>> Great, good afternoon to the Washington Department of Ecology and everyone here from the communities. Someday I hope to be on the same side and we are working for green jobs. I am married Patterson, descendent of Scottish, Irish and-- immigrants. My grandfather grew up never knowing his own father who was killed in a coal mine accident in Scotland's. Fast-forward 2020, my own daughter is an environmental engineer in California state government. Trying to restrain the fossil fuel industry which continues to hold us in its tentacles. After more than five generations of fossil fuels, isn't finally time to say no and keep all fossil fuels in the ground where mother nature indeed put them? Two specific points, the first one the impacts of the fossil fuels in the U.S. or China for plastic or for fuel is immorally narrow comparison. In comparison with nobles is essential for any serious evaluation. I believe it is missing from this. Second, on the question of leaks and fires during the entire lifecycle of methane, methanol, plastic and fuel, did the authors of the SEIS consult experts at Cornell University?

Did the authors or any of you here today view the video of chasing methane on YouTube, again chasing methane on YouTube or anyone interested. According to Noah, Lake are not 1 or 2 or 3% speculative report but some cases over 10%. Fails to use top-down leak measurements and thank you very much.
