

Marylyn Cornwell

My name is Rev. Dr. Marilyn Carmel, I may retired Episcopal priest, scientist and member of ort of earth ministry. A person of faith I believe in a just and sustainable future. And clean air, clearing skies, clean water and abundant water are the birthright of all created beings. That sustainable future is at great risk.

I know a bit about the risk of fossil fuel plants for communities near them. I did my graduate work and self Texas where air and water pollution from oil and chemical plants has devastated human communities and the oceans living creatures. With long-term consequences for all the environmental of a station caused by the gas refined into methanol begins right where it is ran into the ground. I listened to the-- what the land and his family for over 150 years, because of Frank mining his family can no longer use it to drink. Leaks during fracking, transportation, refining it into methanol and then shipping the methanol overseas for youth are linked in a chain of illusion around the neck of the people and creatures of this plan. That was regularly contribute to greenhouse gas pollution. The cry that we cannot breathe becomes even greater if that chain tightens. Is the moral and spiritual obligation to confront the misinformation, speculation and omissions about the environmental effects of ethanol production by NWIW. The environmental cost to the many far outweigh any profit that would be made by the few. I urge you to deny the shoreline permit for the plant. The lives of the most vulnerable among us and those in future generations depend on it. Thank you.
