

Martha Bishop

I see the effects of climate change all around. I grew up on Fidalgo Island where crossing a sandbar meant getting squirted multiple times by clams. We would fish for little fish, and find tiny pink shells smaller than my finger nail. The number of clams is diminished and I haven't seen the tiny pink shells in ages. Ocean acidification is most likely contributing to this. That, plus other pollution from extraction industries and fossil fuel use, spells disaster for our land and water. Who are the few who will benefit the most from building this huge methanol plant? Not our world.
