

## Tracy Ceravolo

The SSEIS makes the huge assumption that China will continue down the path of using coal unless NWIW brings new methanol online, in which case it will replace that amount of coal with methanol. This is an absurd assumption. China wants to reduce their greenhouse gas emissions, so they will look for a way to do that. Coal doesn't make sense any more. Renewable energy sources are less costly than coal, so perhaps you should look at methanol coming from Kalama vs. wind turbines, solar, geothermal, or even some emerging technology that uses wave or tidal energy. To say that continuing to drill new wells and frack gas to help the climate is completely incorrect and insulting.

We have known about Global Warming for more than 4 decades. It would be criminal to allow the permits to build this facility which will contribute to the Climate Crisis and harm our future!
