

## Nancy Hansen

Greenhouse gases have to go down, not up. By allowing new facilities to do the same old thing, we will never get to a place to meet goals required to survive. The people at Kalama have told you what their city is like with having to breathe air only due to the processing. Just think of plastics that will be produced with the export of these fuels. No more. We are not handling plastic wastes and there is no prospect of doing this because they do not break down. No company wants the job of dealing with this. Then, go to fracking itself and use of gallons and gallons of water to extract, contamination of groundwater near these wells, the fact new ones have to be started in order to extract more. Not a sustainable way to use our earth's treasures. Everywhere I go people are seeing the nightmare happening around them. Young people are the victims. This has to stop now, and at the source, which is decisions on approval or not. You have total responsibility for this decision. Please do it for all of us, not for corporations that aren't even going to be able to continue much longer anyway. We have all put up with too much destruction for far too long. Get the balance back. Thank you.
