

Jay Monk

It is absolutely essential that the proposed Kalama Methanol refinery be denied its application for construction. The reason is simple: we cannot afford to build new infrastructure factory dependent for its functioning on using resources (Methane is a potent GHG) that contribute to the worsening of conditions in our climate and producing plastic which is known to pollute the water and land and people's bodies. The external costs associated with plastics production and its end of life process is enormous and Northwest Innovations LLC will surely not take responsibility for these costs in its factory and business model.
