

Pete Weymiller

According to a consensus of global experts in science, economics, and national security climate change is the greatest threat to our health, natural resources, national security and future economy.

Extracting, transporting and burning fossil fuels not only pollute the land, air and water they are the biggest contributor to climate change.

Fossil fuels already endanger our health, natural resources and economy. I have just breathed seven days of some of the most polluted air on earth that was caused by the forest fires generated by climate change.

Our precious fresh water resources are threatened by fracking for natural gas. And the risk of major explosions from natural gas has already been exposed.

With nearly 200 new residents to the NW each day we need to promote sustainable energy resources that we have already developed, ones that have made dangerous fossil fuels like natural gas obsolete.
