

John Flynn

My name is Don Flynn and I'm a resident of Kalama Washington and I fish in the Colombia River, and I'm adamantly opposed to the construction of the methanol refinery on the shore of the call be a river. Primarily on environmental grounds and secondarily on aesthetic grounds. Negative adverse impacts this project would have on our environment and health is even more critical today considering the catastrophic wildfires we are experiencing in Washington, Oregon and California with the associated loss of life of property. This refinery alone would emit 4.6 million nitric tons of greenhouse gas emissions annually and in addition this refinery would emit 53 tons of toxic and hazardous and chemical pollutants into the air per year along with 62 tons of particular matter. It's imperative we reduce greenhouse gas emissions and toxic air pollution's rather than increase them. The vapor from the tooling towers from which millions of gallons of water will be evaporated would reach between one half to 3/4 of a mile high and 112:45-mile and a half wide. I see myself fishing with family and friends in the shadow of the world's largest methane gas methanol refinery. I urge the Department of ecology to deny any and all permits for this project. Thank you.
