

## Marion Ward

The most important crisis facing our planet is climate change caused by carbon pollution. It is imperative that carbon-producing sources be phased out throughout the world. The Kalama gas-to-methanol project would "phase-in" a huge carbon producing source. Fracking at the source produces methane, the refinery would produce millions of tons of carbon every year, and burning it overseas releases even more carbon. What happens one place effects the whole planetary system. Nothing happens in isolation. For the sake of my children and grandchildren, I implore you to deny the permit for Northwest Innovation Works.
