

Theodora Isongus

Good afternoon, I'm Dr. Theodora s address, environment, health scientist and epidemiologist with over 44 years experience evaluating effects of environmental pollutants. I fear the Washington Department of ecology is not taking science seriously. And a spokesperson for ecology concludes that read house gas emissions would reduce market this plant were operating then if it were not. This conclusion depends on other less efficient plants, seeking operations if this plant were operating. There is no way to know this and it would

Increase gas emissions in order to have a livable future. When there is overwhelming scientific evidence that we must make drastic reductions in greenhouse gas emissions now.

We can't afford to go down this suicidal path. We are assaulted by catastrophic climate disruption causing increased heat, droughts, wildfires, and breathable air, increased illness and death from heat, storms, diseases, no mac of lung disease, aggravated by air pollution, displacing thousands of people and what more of a wake-up call do you need? Please deny the shorelines permit and reject this proposal.
