

Craig Heverly

It seems the argument being put out by this study goes something like this: "If we don't pour our gas on this fire, someone else will and they will pour more than us. So, isn't it better that we pour ours first?"

The point is, no one should be pouring gas on the fire. The fire is already out of control and the only way to quench the blaze is to stop fueling it. And fracked gas and methane are frightening fuels.

With the planet blazing like Hell, what insanity to even toy with building this monstrosity! Please, think again. Put a stop to it once and for all.
