

Mike Reuter

Hello my name is Mike Ruger and I'm speaking here as an individual and not as mayor of Kalama. I am opposed and some of the issues I will speak on now. The Northwest energy and for structure as a real thing, looming energy shortage caused by this resource monster will have the devastating effects on the local and state economy. Over two thirds of all average days demand that gas and Northwest pipeline and 100 μ W of clean hydropower combined with 4 million gallons of water all used by one customer. Is unacceptable. This perfectly design weapon to take out all the natural resources at one time. Way to shut down all the coal fire power plants supply firm renewable energy and meet the future needs in order to expand or start a new large energy manufacturing company. Without serious constraints. A 3 to 5-year past history of gas availability in order to study or to prove that there has been 320 million firms available, 247, rendered 65 days a year. And be not one winter day that would be even close to capacity. And also would like to see if the natural gas increase caused by the natural gas to world markets would cause paper mills and large industrial users to use higher carbon footprint opens like biomass oil or other fuel gas prices. It is up to China, not America to use the best way of making future refineries and be a partner for global reductions for future generations.

Thank you very much.
