

## Alana Steinke

>> Good afternoon. Name is Alina Starkey I'm a retired RN, this is nothing but business as usual for the last many decades. We knew we had to decrease greenhouse gas emissions from burning fossil fuels in order to help the planet. Now our world is on fire, smoke is choking us making us sick and yet ecology is suggesting that it's okay to release millions of tons of house gases every year from just this one project. SEIS makes assumptions and speculations with no facts to support them.

Not only with this project, sickened local citizens and most likely we will be paying for it from our pension funds. The Chinese would build it and profit from it and our expense. Will they be required to post risk funds since the site would be built on fill in a liquefaction zone once it become a stranded asset, taxpayers will be left with the cleanup. There is no way to mitigate the climate harms for allowing additional fact projects and there is a bumper sticker that says climate change is just another way to burn in Hell. We are certainly getting a taste of that right now. And my eight-year-old grandson Marlon said I'm not having any and humans might even be extinct by then. That made me very sad. Because SEIS is grounded on the theory of displacement used on a speculative economic future. Your decision affects everyone's grandchildren. Please don't amble away their future. Deny this project.
