The proposed Kalama methanol plant would have severe negative health impacts for Washingtonians. As we grapple with the impacts of climate change, with the entire state under hazardous amounts of smog for much of September, it is reckless to consider building one of the largest methanol plants in the world here in our state. Methane, which will be leaked from the facility and in transport, is many more times potent than carbon dioxide as a greenhouse gas. The facility would use more water per day than the entire city of Portland.

This project will harm human health. As a physician, I cannot condone to building of this plant in our state.
