

## Linda Magnuson

Methanol is a potent greenhouse gas. We are in the midst of a climate crisis and extreme drought in Washington as well as Oregon, where I live. Hazardous air quality due to the smoke of numerous, monstrous wildfires, have weighed on us. These fires were driven by a combination of dryness of the forests, unsuccessful forest management practices that left lots of kindling and high wind conditions. The drought is effected by increase in greenhouse gases from the use of fossil fuels. This plant is not a good fit with what is going on in the world right now. From a personal level, I wants viable future for my family and for all people and other species with whom we share this planet. Consider the future and the health of our planet.
