

## CRAIG LIMOGES

After all the State (Pacific NW, really) has been through with dam building and the consequences that result, I'm disappointed there is yet another dam being considered. Dams have been coming down on numerous rivers in numerous States, after recognizing the long-term damage, especially to anadromous fish populations. Negative consequences include siltation backups behind dams, the threatened extinction of wild fish species, warming of the water in the resulting reservoir(s), proliferation of invasive species in water that could not support them until a dam is built. There are many negative consequences that result from this proposal. Please try a different methodology to control flooding. Don't sacrifice the beauty and life-sustaining environment of a naturally-flowing river.
