

Sherry Bupp

Dams have been shown to be much more damaging than helpful to the ecosystem. Several dams on the Snake River are being destroyed to repair salmon runs and improve the lives of people, animals, and plants in the area. Dams won't stop major flooding long-term, but they will destroy irreplaceable habitat. The DEIS clearly shows that this dam will have catastrophic impacts. Salmon, wildlife and tribal treaty rights are at risk!

There are known science-backed, non-dam flood solutions already available. Restoring floodplains, strengthening local infrastructure, and investing in resilience are smarter, safer solutions!
