Dams are a one-size-fits-all solution for very divergent flood problems. In dealing with the Chehalis River, one has to realize that it is one of the few intact river systems in Washington, supplying an abundance of salmon to the food chain. Allowing so many types of wild salmon to become extinct would be a disaster.

Reducing flooding with more local solutions is the way to go - allowing the co-existence of the natural world that gives us so much with the homes of people who wish to live safely in that beautiful world.
