

# Nicholas Terry

I believe we should use better science backed research in a different approaches to this problem.

The Department of Ecology found that this would hurt already dwindling salmon and steelhead populations even further. That is a trade off that should be weighed heavily.

Is this dam truly necessary? Can we use more nature friendly science to find a solution to this problem that preserves this river?

Let's fund non-dam approaches to flood problems. That could include restoring floodplains, strengthening infrastructure and investing in resilience.

Let's preserve our natural state as much as possible and use our ingenuity in science and engineering to meet these problems with that in mind.

Thanks!
