

Dale Meck

I would request that Ecology (and the State more broadly) clarify how "clean energy" is being defined in this context. Is the term based solely on operational greenhouse gas emissions, or does it also consider lifecycle environmental impacts such as mineral extraction, manufacturing, land use, transmission infrastructure, equipment replacement, recycling inputs/limits, and end-of-life disposal? That important distinction should be made more clearly in news releases, public hearings, and in the SEPA documentation.
