

Jay Kuhn

It is unbelievable that WA, of all places, that aspires to a leader in green energy would give any consideration to building a new fossil fuel plant. But this is not just wanting to "be green". It seems to me some one is not doing their homework. The price of battery peaker systems has been reducing rapidly as the price of batteries continues to plummet with the increased demand for EV's. This is what more and more utilities are doing around the world with California and Australia leading the trend.
