

Daniel Spilman

Well, the data that has been accumulated to date stand squarely in the corner of proceeding extremely slowly on fracking, if not outright banning the practice. We have plenty of examples in PA of major groundwater contamination, and Oklahoma is going to be one big superfund site in the decades ahead. It is time that we as a society start taking the 'precautionary principles" seriously, before we saddle our grandchildren with more damage, and a larger section of the US that can not be lived in without risking your families health.
