

Carl Holliday

Future generations will reap what we sow. Water, the most valuable commodity on the planet, must be protected for those generations. The deliberate dumping of known chemical waste into the major source of our water supply is beyond irresponsible; it is criminal. The procedures and cost of scrubbing the chemicals out of waste water should be borne by the gas companies. The solution to pollution is NOT dilution. The impact of chemicals underground at the fracking sites is still undetermined, but there is no doubt that pouring these chemicals into our water supply will be harmful to the flora and fauna that depend on that water. Please do not become a willing partner to an industry that wants profit now with no thought to long term and irreversible impact.
