

## Debra Borowiec

It is incomprehensible to me that you are even considering the allowance of fracking in or near the Delaware River Basin! Are you aware that the world is quickly running out of clean water and that by 2030, the world demand for water will be 40% greater than the world's supply?! How can you in all moral and ethical consciousness even consider using the Delaware watershed to provide water for fracking?? And how can you consider dumping toxic wastewater back into the River? It would seem that none of you have a background in chemistry or you would know that fracking wastewater can not be made safe enough to drink. In fact, fracking should be banned everywhere, not just in the Delaware Watershed. In addition, are you aware that fossil fuels contribute to climate change?
