

Lawrence Gioielli

Hydraulic Fracturing is a danger to all our water supplies. Chemicals, most of which are trade secrets, are pumped into areas that are fractured under great pressures. There is no way of knowing if these chemicals will remain sequestered in the ground forever or if they will become a future generation's problem. Chemicals and gases seep to the surface and into our surface water and air. And fracturing causes the earth to move with unknown consequences. Do not allow hydraulic fracturing near or in the Delaware's water shed area.

Sincerely Yours,
Lawrence Gioielli
