

Toni Battiste

Pumping toxic chemicals into the ground can destroy aquifers and pollute water supplies. Once that occurs, it can't be fixed. We need clean drinking water and reasonably clean water for bathing and planting crops. The gas can be extracted by other methods, which while possibly more costly and less efficient, do not cause major damage to the environment. Our children need to be able to grow up without the damaging effects of the toxins. So do the animals and vegetation. I am sure that the companies are not going to be willing to escrow billions into cleanup funds and obtaining supplies of drinkable water for a large population. Use some common sense and just say NO
