

Ann Kimball

I am against hydraulic fracking and all related activities that impact the Delaware River and its watershed. The proposal to dump toxic waste water into the Delaware watershed for disposal risks the contamination of our ground water and drinking water supply. Additionally, the proposal to export millions of gallons of water per day from the Delaware River endangers our water supply as well. In event of a drought, who will get the water...the frackers or the citizens of four states who rely on the river for their public water supply? The fossil fuel industry has promised "clean" practices, but that is a contradiction in terms. There is ample evidence from other states to show that this is an empty promise.
