

# Mildred's Lane

Please,

I teach and operate a residency for cultural practitioners all ages in Damascus Township, Pennsylvania; right on the Delaware River with a tributary stream running through it. The possibility of allowing Fracking in the Delaware Valley River Basin threatens my very existence as well as the community I work and live in, across from Narrowsburg, NY.

Why? Why would anybody threaten water availability, when the world is already under threat of lack of it? Why aren't we focusing on the control and abatement of water pollution?

It is not worth the risks. The argument of economic development cannot match that of our special existence in the future. We need to concentrate on the conservation and protection of drinking water supplies! More it is ethically wrong to ignore the conservation and protection of aquatic life and all other species that drink this water. This becomes an issue of rights for all life on this planet!

The Delaware River has been under threat and one of the most endangered rivers and we should be protecting conservation of water quality in these Special Protection Waters. Water is running out. Support the protection, maintenance, and improvement of water quantity and quality basin-wide.

Thank you,  
J. Morgan Puett for Mildred's Lane
