

## William Davis

With the "fracking" process there is a PERMANENT LOSS of water via injection deep into the earth and by contamination of injection water returned to surface sites . This loss of this pristine water resource would be a fundamental ILIFE THREATENING blow to the Delaware River the literal fountainhead to quality drinking water to millions of people,

The beauty of this natural and barely disturbed ecosystem could suffer permanent and irreparable harm. - a loss of a rare easily accessible UNIQUE RESOURCE to people in the eastern USA and Wayne county.
