

## Martha Edwards

I dislike the process of piping pressurized scentless gasses through Chester County and every other location. Methane leaks that remain from centuries-old wells and the potential for additional leaks that endanger life after the initial disruption of installing these pipes through vulnerable territories, especially karst formations is too likely. It smacks of a failure to properly evaluate total risk versus return. Risks are carried by those not associated with the fossil fuel companies and their transportation subsidiaries, while they through improper cost accounting and therefore cheap installations reap the benefits in their booked profits from their lack of environmental and safety concerns. These structures and their conduits should not be permitted, let alone sponsored by our governments. renewable energy is vastly safer and better for all concerns.
