

Matt Bethurem

The dangers of hydraulic fracturing are myriad, and have been documented time and again -- the practice threatens water supplies, air quality, and exacerbates the already runaway problem of climate change. Allowing the continuation of fracking in the Delaware River Basin is a simple equation in which the profits of corporate gas giants equal more than the rights of the public to clean water, clean air, and a habitable planet. Do not allow this practice to continue in any form -- Ban hydraulic fracturing in the Delaware River Basin.
