

Carl Arnold

Over the last ten years, there has been an ever-increasing mountain of scientific reports and empirical data showing conclusively that gas is neither needed nor can the earth afford more fossil fuel development. Doctors and nurses in both Pennsylvania and New York have produced reports documenting the health hazards of fracking and its infrastructure — compressors, pipelines, etc., and too many citizens have had their aquifers permanently contaminated and lives destroyed. Leakage of from drilling, compressors and pipes themselves put pure methane into the atmosphere, hastening climate chaos. There is no earthly reason, based on science and common sense, to continue this travesty.
