

Adele Wolfe

How can dumping toxic frack waste water in the river basin even be considered??!! This water includes hundreds of "exempt chemicals," including radioactive materials. The proposed treatment hasn't previously removed them and the particles, so exactly what would be different here, but with exponentially riskier ramifications. Dozens of documented incidents of failure and nasty collateral fallout.

Additionally: allowing the industry to extract fresh water directly from the watershed for drilling, which requires millions of gallons per well, is equally insane, and we hope the DRBC will be guided by data and facts accordingly.

Thank you.
