

Kathleen Roberts

All living things need clean water (H₂O) in order to survive. No one except fossil fuel corporations need fracking or other dirty air and water polluting methods to obtain more fossil fuels when we have better, cleaner sources of energy available from renewable responsible companies in this 21st Century. There should not even have to be a debate about whether it is acceptable to risk polluting more of our water resources for private monetary gain at this point in time. Keep the fossil fuels in the ground and keep our water safe for use by the planet.
