

S. Gluck

Fracking is proving to be unsafe for human and animal life, and for the earth and our water. It has been shown to poison and ruin underground water resources that are then left unsafe for human consumption and uncleanable. Once we ruin our water sources from fracking, we cannot clean the water.

Fracking has also caused earthquake-like geo-volatility in places like Kansas and other fracking-popular states.

Fracking has many downstream affects that cannot be resolved. Homes are attached to unsafe water sources. People have become ill from poisoned water. Homes have become unstable from the new geo-volatility issues. People are stuck with unsafe housing on unsafe land.

We are also hurting fragile animal ecosystems by tampering with our land and water sources.

Fracking has caused all of these issues, direct or downstream. The endless problems caused by fracking cannot be undone.

If it is more energy and fuel we seek, it is far better that we look to renewables, i.e. wind and solar, and even hydro. These do not disturb or threaten human and animal life, plus they create even more jobs than hydraulic fracturing.

We are a foolish nation to allow our natural resources to become poisoned and forever ruined. There are countries who weighed this same issue and knew very quickly that hydraulic fracturing was a lose-lose proposition. It's time to look at sustainable energy and leave fracking behind.
