

Letitia Ryan

Dear Sirs:

I will be brief in my comments but it does not dismiss my concern for the water in Pennsylvania and in this case, The Delaware River Basin.

The bottom line is no one knows what the long terms effects of fracking will do on our water supply. Yes, it's important to use our natural resources and try to be independent of other countries for our energy supply but we must think what we are doing to our resources. What happens when our drinking water shows even trace amounts of the fracking effects? Where will our next drink of fresh clean water come from? Who could have predicted fifty years ago that do many people would pay money for a bottle of water? There are already water wars going on in our country in California. Then enter the complications of wildfires and other acts of Nature. I have toured a fracking plant and see the unimaginable depths and area that it takes to do the actual fracking process. And then I read that according to our FDA it's alright for humans to ingest trace amounts of TSB! Really!!! This is banned in the European Countries. What are our government officials thinking. Why do we need to clean up more water? Why do we need to clean any water? Leave our natural resources alone and stop playing with what is our right in Pennsylvania according to our Constitution. We all have the right to clean water. Keep it that way! Do not play with our water anymore! Do not let fracking water be released on the Delaware River Water Basin.
