

## Tracy Sallows

Please protect the Delaware River, and all the people who rely on it, from hydraulic fracking. Safe, uncontaminated water is absolutely vital to everything; we drink it, bathe in it, cook our food with it, wash our clothes in it and water our crops with it. Fracking causes water to be contaminated with chemicals and gas, and once ground water is contaminated, there is no containing it. Water affects everything; if it is contaminated people will get sick and diseased. Water is life. Water is the future. States that are smart enough to protect their water will be selling it to parts of the country that are foolish enough to allow fracking. The states that have protected their water will prosper while the states that have to buy safe water will become poorer. The way to prevent this and keep everybody safe is to not allow fracking. Please think of the future generations who's health and safety will be affected by this decision. What kind of water would you like your grandchildren to have in their faucets, rivers and lakes? Thank you for your time.
